Berkeley, G. (1713) *Three Dialogues between Hylas and Philonous*, in *Works*, vol. 2, Edinburgh: Thomas Nelson. (A lively exposition of the metaphysics argued for in the *Principles of Human Knowledge*, with an emphasis on its supposed conformity with common sense. Highly recommended to those reading Berkeley for the first time.)

Berkeley, G. (1713) Essays in the *Guardian*, in *Works*, vol. 7, Edinburgh: Thomas Nelson. (Short essays published in Richard Steele's short-lived periodical, evidencing Berkeley's opposition to any form of irreligion. Essays in the *Guardian* were published anonymously. Those included in *Works*, vol. 7, are the ones Luce judged were by Berkeley.)

Berkeley, G. (1721) *De Motu*, in *Works*, vol. 4, Edinburgh: Thomas Nelson.(Berkeley abandoned his plans to publish further parts of the *Principles*, including one on natural philosophy. This essay on the cause of motion covers some of the ground that might have been dealt with there.)

Berkeley, G. (1732) *Alciphron: or the Minute Philosopher*, in *Works*, vol. 3, Edinburgh: Thomas Nelson.(A defence of religion, and Christianity in particular, against 'free-thinkers'. Observations on the uses of language contained in the last of the seven dialogues into which the work is divided give insights into how Berkeley's thinking in this area developed.)

Berkeley, G. (1733) *The Theory of Vision, Vindicated and Explained*, in *Works*, vol. 1, Edinburgh: Thomas Nelson.(A third edition of the *New Theory of Vision* had been annexed to the first edition of *Alciphron*. In *The Theory of Vision, Vindicated and Explained*, Berkeley responded to an anonymous critic.)

Berkeley, G. (1734) *The Analyst*, in *Works*, vol. 4, Edinburgh: Thomas Nelson.(A technical work on mathematics, revealing alleged obscurities and contradictions lying at the root of the infinitesimal calculus. The work, which was addressed to 'an infidel mathematician', argued that mathematicians were poorly placed to object to obscurities in Christian doctrine.)

Berkeley, G. (1735) *A Defence of Free-thinking in Mathematics* and *Reasons for not replying to Mr. Walton's Full Answer*, in *Works*, vol. 4, Edinburgh: Thomas Nelson. (Two tracts, published in the same year, responding to two critics of *The Analyst*.)

Berkeley, G. (1735-7) *The Querist*, in *Works*, vol. 6, Edinburgh: Thomas Nelson.(A series of short rhetorical questions, motivated by Berkeley's deep concern with the economic state of Ireland and the poverty of the Irish people. By now little more than a curiosity, the work was deservedly popular at the time.)

Berkeley, G. (1744) *Siris: a Chain of Philosophical Reflexions and Inquiries* (etc.), in *Works*, vol. 5, Edinburgh: Thomas Nelson.(A work in which Berkeley moves from a consideration of the supposed virtues of tar-water as a medicine, through reflections on natural science, to observations on God and the Trinity. Although popular at the time, this work is of little interest now, except to specialist scholars.)

Concentrates on topics such as representation, abstraction, and cause and effect, in an attempt to deepen our understanding of Berkeley's central arguments.)

Berlin, Isaiah (1909-97)

Berlin said that he decided about 1945 to give up philosophy, in which he had worked up to that time, in favour of the history of ideas. Some of his best-known work certainly belongs to the history of ideas, but he continued in fact both to write philosophy and to pursue philosophical questions in his historical work.

His main philosophical contributions are to political philosophy and specifically to the theory of liberalism. He emphasizes a distinction between 'negative' and 'positive' concepts of liberty: the former is a Hobbesian idea of absence of constraint or obstacle, while the latter is identified with a notion of moral self-government, expressed for instance in Rousseau, which Berlin finds politically threatening. His anti-utopian approach to politics is expressed also in his view that values necessarily conflict; this irreducible 'value pluralism' may be his most original contribution to philosophy, though advances it through example and historical illustration rather than in semantic or epistemological terms. He also expresses himself against necessitarian interpretations of history, and in favour of an anti-determinist conception of free will.

1 Against reductionism

Isaiah Berlin was born in Riga, Latvia, of Jewish parents; the family emigrated in 1919 to Britain, where he was educated and spent his life. He worked first in general philosophy, and in the 1930s took part, with A.J. Ayer, J.L. Austin and others, in discussions of questions about knowledge and meaning which were raised by the logical positivist agenda of the time. (Papers related to these interests, mostly published rather later, are collected in Berlin 1978a.) Berlin was never tempted by positivism. Besides pressing realist objections against such proposals as the dispositional analysis of statements about the unobserved, he rejected its scientific paradigm of knowledge and its lack of interest in historical understanding. Paradoxically, the most positivist element to survive in Berlin's thought is his definition of philosophy, as concerned with questions that defy solution by the a priori and the empirical sciences. It may also have been a positivist influence that encouraged him to draw a sharp distinction, in his formulations though not in his practice, between his philosophical and his historical interests (see Logical positivism).

In his work in the history of ideas, Berlin paid particular and sympathetic attention to thinkers such as Vico and Herder who have emphasized cultural difference across time, have stressed the need to understand other ways of life 'from the inside', and have resisted the impulse of the more rationalistic strains of the Enlightenment to reduce the range of human concerns to some limited set of motivations which are met more or less efficiently by different social formations. He denied that there is a 'fixed and unalterable' human nature. At the same time, however, he firmly resisted relativism of any type.

At the level of interpreting other societies, he accepts that there are universal human potentialities, limitations, and indeed sentiments, and believes in fact that we would not be able to understand those societies except on this assumption. The denial of a fixed human nature comes to saying first, that there are many different and no canonically correct expressions of these potentialities; second, that what expressions these potentialities might receive cannot be recognized in advance of historical experience; third, that these two points hold good for the future, so that there can be no Hegelian (or - more particularly for Berlin's concerns - Marxist) total realization of human possibilities (see Hegel, G.W.F.; Marx, K.).

How far, in Berlin's view, we might go in forming a definite picture of human potentialities is unclear. On the one hand, Berlin, sharing with his favoured authors a keen sense of cultural particularity, is impressed by the unpredictable distinctiveness of different forms of life, as of artistic styles. On the other hand, we understand these forms of life, in part, through values that are expressed in them, and there is nothing in Berlin's work to rule out the idea that, although the cultural forms are manifold, the values expressed in them might be limited, and indeed quite few, in number. If so, there may be room for an account of human nature which would explain why, at a general level, only a certain range of values are candidates for expression in recognizably human cultures (see Human nature).

2 Value pluralism

These values, Berlin repeatedly urged, make conflicting claims and cannot be totally reconciled with one another

without loss. Political schemes, moral theories, and religious aspirations have repeatedly tried to deny this truth and to claim that, properly understood, values do not ultimately conflict: ‘true’ liberty, for instance, will not conflict with ‘true’ equality. Berlin rejects such outlooks, for several reasons. Politically, attempts to put them into practice have always been a disaster, in terms which only their most fanatical adherents can deny. Ethically, they are an evasion, and pretend that an intellectual construction can make life easier than it is. Philosophically, they are a mistake.

Not being concerned with meta-ethical analysis, Berlin does not try to counter the objection made by some critics that the status of this last claim is obscure, but concentrates on substantiating the first two claims. Berlin himself, because of his views on the nature of philosophy, is disposed to agree that the philosophical claim is distinct from political and ethical claims, but the best interpretation of his outlook may well be that the philosophical claim is to be understood through the others. Whatever theory of values we accept, our conclusions about their structure can be sensibly constrained, protected against being an arbitrary fantasy, only by serious reflection on political and ethical experience, and for Berlin this essentially depends on our best historical understanding.

Berlin’s claim of ultimate value pluralism encounters philosophical problems about its content, as well as about its status. In practice, policies do have to be adopted, some ways of life favoured over others. Berlin’s pluralism insists that such choices often involve value loss, denies that there is one currency in which the gains and losses can be calculated, but claims that the choices are not therefore irrational. Questions of how these views can be consistently interpreted are important to the theory of practical and evaluative reasoning: they are sometimes expressed as questions about the incommensurability of values.

Questions about the status and the content of value pluralism are important to Berlin’s defence of liberalism. He clearly regards liberalism as a political order which in some sense particularly respects value pluralism. It would be untrue to Berlin’s outlook to take this in a metaphysical sense, as implying that the liberal state best expresses the real structure of values. Rather, the arguments for liberalism use the same historical and political materials as the arguments for pluralism. To this extent, Berlin’s liberalism, with its emphasis on the human costs of non-liberal, ‘totalizing’, political visions, is close to what Judith Shklar (1989) called ‘the liberalism of fear’, an outlook which owes much to Montesquieu, Constant, De Tocqueville and a strong sense of modern historical experience.

Another line of interpretation suggests that, for Berlin, value pluralism is specially honoured by liberalism because liberal states emphasize the individual’s freedom to choose, in particular between different values and forms of life. This makes such freedom - freedom as autonomy - a privileged value in Berlin’s outlook, and associates him rather with von Humboldt and J.S. Mill. But it is doubtful whether autonomy is privileged by Berlin in this way. It would be barely consistent with his own treatment of liberty (see §3), and it is questionable whether value pluralism can be coherently used to promote one value over others. In any case, Berlin is notably ambivalent about the more defiantly individualist aspect of liberal societies. Above all because of his Zionist sympathies, he is at least as much interested in the individual’s ‘need to belong’ to a community, and in cultural rather than individual self-determination. To some extent, these sympathies stand in tension with his liberalism, but they also condition it, in such a way that radical autonomy and individual self-expression should not be seen as its most central values (see Moral pluralism).

3 Liberty

Berlin discussed more than one question related to liberty: he opposed ideas of historical inevitability, and resisted compatibilist theories of free will. He is best known, however, for his views on liberty as a distinctively political value, in particular for a distinction between ‘negative’ and ‘positive’ conceptions of liberty. Negative liberty is defined in traditionally Hobbesian or empiricist terms, as the absence of external constraint or interference. Positive liberty is understood, rather, as self-mastery or self-realization, two aspects which are themselves not very strongly distinguished from one another.

It is important that this is not only a distinction between two political conceptions, but a political distinction, which gets its content from its relation to two different styles of political thought. It is not, for instance, a distinction between ‘freedom from’ and ‘freedom to’. Though negative liberty centrally covers freedom from intentional interference, it does not cover the famous freedoms of post-war liberal politics, such as the freedoms from want,

disease and unemployment. Berlin is not opposed to the objectives that are expressed in this way, but in the general spirit of pluralism finds it more helpful to place them under values other than freedom, such as welfare or equality. Again, negative liberty does not cover freedom from internal compulsions. This freedom might be said in any case to represent an ethical or psychological aspiration, rather than a political conception. However, Berlin does associate it with positive liberty, and this precisely illustrates the point that on his view positive liberty is a political conception that aspires to have too much ethical content (it is, in John Rawls' terminology, 'perfectionist' (Rawls 1971: 25)). Negative liberty can extend to freedom from political manipulation, but seemingly only in gross forms which would be described even by everyday conceptions as restricting agents' freedom to act. It would not extend to freedom from ideological determination or false consciousness, which again would be associated with positive liberty.

The thread that holds together these various associations and exclusions seems to be that negative liberty is meant to be minimally normative in its definition. It is, of course, a value and brings with it a norm or positive evaluation, but in giving an account of its content, Berlin tries as far as possible to exclude other normative and evaluative ideas. This same point comes out in Berlin's treatment of the traditional difficulty that if liberty is measured by the ratio of actual desires to the capacity to fulfil them, it will follow that one can increase liberty just as much by reducing agents' desires as by increasing their capacities. Berlin answers this simply by appealing to possible as well as actual desires. This line involves the difficulty that if no limits are put on what an agent could possibly desire, everyone will be equally unfree; it seems that Berlin would rather face this problem than appeal to measures of liberty that bring in further normative elements, such as the idea of desires that agents might reasonably be expected to have, or of those that agents in society might reasonably expect to satisfy.

Berlin's treatment of liberty seems have three different sources. One is his pluralistic aim of keeping liberty as far as possible distinct from other political values. Another is that he is suspicious of accounts of political values which tie them too closely to non-political values, in particular to perfectionist ethical aspirations for the individual. Third, and relatedly, he is impressed by the fact that political programmes which advance such values have been historically associated with the actions of an elite trying to impose an interpretation of people's supposed real interests. Berlin's favoured negative concept of liberty, like other aspects of his thought, is not a purely analytical proposal, but is defined by conceptions of liberalism and of the political which are consciously shaped by responses to actual historical developments, above all the Russian Revolution (see Liberalism).

Bernard of Clairvaux (1090-1153)

Bernard was recognized by his contemporaries as the spiritual leader of western Europe. He was an indefatigable advocate of the monastic life and occasionally criticized the schools on moral grounds, but he was by no means an anti-intellectual. He encouraged a number of early scholastic philosopher-theologians in their work. Although he devoted the better part of his efforts to his wide-ranging pastoral duties, Bernard's own sermons and treatises make a significant contribution to twelfth-century theology and philosophy.

Bernard was born into a noble family in 1090 near Dijon in Burgundy, and studied grammar, rhetoric and logic at Châtillon. Abandoning plans for further study, he joined the Cistercian Order at Cîteaux in 1113. Only two years later, he became the first abbot of the new Cistercian foundation at Clairvaux, a position he held until his death in 1153. During his abbacy of almost forty years, Bernard exerted a profound influence over the intellectual and religious life of western Europe. The extent of his influence may be measured by the sixty-five daughter monasteries established by Clairvaux during Bernard's lifetime, his nearly single-handed resolution of the papal schism of 1130, and the fact that one of his own monks assumed the papacy as Eugenius III (1145-53).

Bernard was actively interested in the schools of his day (the precursors of the medieval universities) and was reasonably well-informed about academic discussions in theology. In his controversies, first with Peter Abelard in 1140 and then with Gilbert of Poitiers in 1148, Bernard wished to expose and correct what he saw as heretical opinions. Concerning atonement, for example, Bernard opposed Abelard's claim that Christ redeemed humanity simply by inspiring love for God and providing a perfect pattern of life. Regarding the trinity, Bernard maintained, also against Abelard, that the relation of the second person to the first was not a relation of species to genus, and that certain divine properties, such as power or wisdom, were not specific to just one or another person of the trinity (see Trinity). In the case of Gilbert, Bernard also disputed some of his assertions about the trinity, the incarnation and the divine essence.

In attacking certain of Abelard's and Gilbert's conclusions, Bernard also showed a distrust of their method, but he did not condemn outright their application of logic to doctrine. Bernard considered all knowledge good in itself, but he believed the pursuit of knowledge should be governed by practical concerns, especially salvation, and not by a desire to know simply for the sake of knowing.

Bernard's feuds with Abelard and Gilbert were more than counterbalanced by his support for other philosopher-theologians. He was, for example, a protector of Peter Lombard and a friend to John of Salisbury. He praised the English scholastic Robert Pullen for his 'sound doctrine' and endeavoured to keep him in Paris. Bernard responded to some inquiries of Hugh of St Victor with a long letter (*circa* 1127) on baptism, salvation before Christ's death and resurrection, and other disputed matters, which clearly influenced Hugh's massive work, *De sacramentis christianae fidei (On the Sacraments of the Christian Faith)*. More than once, Bernard admitted the practical value, even necessity, of scholastic theology in refuting heresy, clarifying obscure points of doctrine and guiding church leaders.

Bernard was an accomplished theologian in his own right, and his writings are characterized by strict adherence to scriptural and patristic sources rather than by philosophical development of doctrine. Most of his sermons and treatises are concerned with the exposition of Scripture and doctrine along moral and contemplative lines. *De gradibus humilitatis et superbiae (Steps of Humility and Pride)*, for example, describes the pursuit of truth through three kinds of knowledge: humility (self-knowledge), compassion (knowledge of one's neighbour) and contemplation (knowledge of God). *De diligendo Deo (On Loving God)* takes up the nature of disinterested love and describes the steps by which one attains it. His longest work, *Sermones super Cantica canticorum (Sermons on the Song of Songs)*, begun in 1135 and left unfinished at his death in 1153, combines scriptural commentary with an examination of the moral and contemplative aspects of religious life.

Bernard sometimes wrote works of theology that were more philosophical than scriptural. His treatise *De gratia et libero arbitrio (Grace and Free Choice)* is a substantial work of philosophical theology, markedly influenced by Augustine, in which he attempts to reconcile human freedom with God's grace. Bernard thinks that the will is necessarily free; in consenting to the good, the will cooperates with grace. His treatise is notable for its definition

of free choice as 'a spontaneous inclination of the will,' and for its innovative distinction among three types of human freedom: freedom from necessity, freedom from sin and freedom from sorrow (see Free will; Grace). This was the most influential of Bernard's works among scholastic thinkers, and elements of it appear in Peter Lombard's *Sentences* and, in the next century, in the works of Alexander of Hales and Albert the Great.

SEAN EISEN MURPHY

List of works

Bernard of Clairvaux (1090-1153) *Sancti Bernardi Opera*, ed. J. Leclerq *et al.*, Rome: Editiones Cisterciensis, 1957-77, 8 vols; trans. as *The Works of Bernard of Clairvaux*, Cistercian Fathers Series, Kalamazoo, MI: Cistercian Publications, 1973-80.(The English translation series includes most of Bernard's treatises and many of his sermons.)

Bernard of Clairvaux (*c.*1125) *De gradibus humilitatis et superbiae (Steps of Humility and Pride)*, in J. Leclerq *et al.* (eds) *Sancti Bernardi Opera*, Rome: Editiones Cisterciensis, vol. 3, 1963; trans. M. Ambrose Conway, *The Steps of Humility and Pride*, Cistercian Fathers Series, Kalamazoo, MI: Cistercian Publications, 1973; repr. 1989.(A profound study of the nature of humility - as reflected in twelve manifestations of pride - and its importance in the attainment of truth; an important source for later medieval ethics.)

Bernard of Clairvaux (1126-41) *De diligendo Deo (On Loving God)*, in J. Leclerq *et al.* (eds) *Sancti Bernardi Opera*, Rome: Editiones Cisterciensis, vol. 3, 1963; trans. E. Stiegman, Cistercian Fathers Series, Kalamazoo, MI: Cistercian Publications, 1973; repr. 1985.(The best introduction to several overarching themes in Bernard's life and thought.)

Bernard of Clairvaux (*c.*1127) *De gratia et libero arbitrio (Grace and Free Choice)*, in J. Leclerq *et al.* (eds) *Sancti Bernardi Opera*, Rome: Editiones Cisterciensis, vol. 3, 1963; trans. D. O'Donovan, Cistercian Fathers Series, Kalamazoo, MI: Cistercian Publications, 1977; repr. 1988.(Takes a moderate, sometimes novel approach to one of the most complex and divisive issues in Christian thought.)

Bernard of Clairvaux (1135-53) *Sermones super Cantica canticorum (Sermons on the Song of Songs)*, in J. Leclerq *et al.* (eds) *Sancti Bernardi Opera*, Rome: Editiones Cisterciensis, vols 1-2, 1957-8; trans. K. Walsh and I.M. Edmonds, Cistercian Fathers Series, Kalamazoo, MI: Cistercian Publications, 1971-80, 4 vols.(A model of allegorical exegesis, this detailed commentary should be read more for its sustained analysis of Christian life and doctrine than for its nominal subject matter.)

Bernard of Tours (*fl.* 1147, d. before 1178)

Bernard of Tours, better known as Bernardus Silvestris, was closely acquainted with the major developments in science and theology which took place in the mid-twelfth century. His major work, the Cosmographia, an allegorical account of the creation of the universe and humankind, is dedicated to the philosopher-theologian Thierry of Chartres, who was probably also his teacher. However, Bernard himself was best known as a poet, and he seems to have made his living primarily as a teacher of grammar and rhetoric. His career perhaps reflects the fragmentation of the liberal arts curriculum in his day, including the segregation of literary studies from the increasingly specialized pursuit of the sciences.

Little is known of Bernard's career beyond his attachment to Tours. The city is recalled affectionately in the *Cosmographia*; Bernard is praised by his pupil Matthew of Vendôme, author of one of the earliest medieval treatises on the art of poetry, as 'the master of Tours', and we know that a nephew inherited his house in the city at some time prior to 1178. The *Cosmographia* also contains a fulsome compliment to Pope Eugenius III, and a manuscript gloss reports that the work was read before Eugenius, to the latter's great satisfaction. This was presumably in 1147, when Eugenius came to France to attend the trial of Gilbert of Poitiers.

No more is known of Bernard's life. Matthew notes his mastery of *dictamen*, the arts of composition, and later writers cite his poems almost exclusively as examples of literary style, so we may assume that this was the main focus of his teaching. Commentaries on Vergil and Martianus Capella, which use mythographic analysis to raise philosophical and religious questions and often closely echo the commentaries of William of Conches, have been attributed to Bernard, but despite suggestive thematic correspondences with the *Cosmographia*, they cannot be assigned to him with certainty.

The *Cosmographia* consists of alternating chapters of prose and verse, in emulation of Boethius' *De consolatione philosophiae* and the *De nuptiis Philologiae et Mercurii* of Martianus Capella, and its narrative of the cosmogony is based broadly on Plato's *Timaeus* (Wetherbee 1972: 152-86) (see Boethius, A.M.S.; Encyclopedists; Plato). Its theme is the process of creation, the realization of the 'seminal virtues' that come to fruition through the union of matter and form. The work begins with the noble and impassioned appeal of Nature to Noys, the agent of divine Wisdom, to order the formless existence of primal matter, which longs for 'the shaping influence of number and bonds of harmony'. The flowering of created life which results has important implications for man, the lesser universe, whose creation will be the culmination of the adaptation of Nature's vitality to the shaping influence of divine Wisdom. Man will find his fulfilment in recognition of the completeness with which his nature corresponds to the pattern and activity of the macrocosm. For man to comprehend this great affinity will be to simultaneously recognize his own lordship and destiny, a realization that mirrors the ordering activity of Noys, confirming that man's mind is created in the image of the Divine Wisdom.

Bernard's vision of the human condition is darkened by a strong sense of the precariousness of material existence and the uncertain power of reason to govern the aberrant tendencies of human nature. Like the visions vouchsafed to Adam in the last books of Milton's *Paradise Lost*, Bernard's foreshadowings of world history offer clear evidence of human guilt and folly. But they also celebrate the fruits of human genius in art, science and technology. The final vision of the *Cosmographia* is heroic, the stoic dignity with which man labours to resist his own instability and order and perpetuate his existence in the face of seemingly insuperable necessity. The work conveys the anxiety as well as the excitement of an age newly engaged with the study of nature and the tenuous linkage of cosmic order and physical law.

At times the pessimistic strain in the *Cosmographia* becomes a kind of determinism, and a similar note is struck in Bernard's other known works. The *Mathematicus (The Astrologer)*, a narrative in Latin elegiacs, tells of a young man confronted by a prophecy that he will slay his father, who resolves instead to take his own life, affirming that such a death will be a release from the prison of material existence (Dronke 1974: 131-41). Bernard's introduction to the *Experimentarius*, a Latin adaptation of an Arab manual of geomancy, affirms the power of God but acknowledges that the planets have a 'natural' power to affect 'the destinies of all mortal things'.

Bernier, François (1620-88)

Bernier was a minor figure who influenced the history of philosophy out of all proportion to his own strictly philosophical abilities. He was effective as a propagandist in the debates over the analysis of matter, and especially as a popularizer of the views of Pierre Gassendi, whose nominalism he sought to apply with greater consistency.

Bernier was and remains the best-known disciple of Gassendi, whose eyes he is supposed to have closed at his death. In the seventeenth and for at least the next two centuries, Bernier was rather less known as a philosopher than as a traveller, especially for his *Memoirs… of the Grand Mogul's Empire* (1670-1), a classic that detailed his ten-year visit to the Indian subcontinent. Dryden based his *Aureng-Zebe* on this work, and Locke, a physician like Bernier, was interested in it, particularly as a source for his investigation of religious psychology under the rubric of 'enthusiasm'.

In philosophy Bernier was a minor figure who none the less played an important role as a polemicist, as a popularizer and as a philosopher in his own right. As a polemicist, he wrote at greatest length in *Anatomia* (1651) and *Favilla* (1653) on Gassendi's behalf against the imprecations of the astrologist J.-B. Morin. More effectively, he turned his satirical pen in common cause with the Cartesians against the political machinations of the Jesuit Aristotelians in his *Requeste des maistres* (1671). Finally, he joined the debates over matter and transubstantiation and, as Pierre Bayle (who published his work) commented on *Eclaircissement* (1684), strongly opposed the Cartesians in order better to make his peace with the Jesuit La Ville.

By far the most influential of Bernier's works was his *Abrégé* of Gassendi's philosophy (1674-8). This abridgement, consisting of paraphrase and some translation, and written in straightforward, non-technical French, became for many their only access to the views expressed in the obscure, late scholastic Latin of Gassendi's lengthy tomes. Bayle's hope that it would remove the need to work through those tomes proved idle, however, for Bernier was an original thinker whose own views influenced the choice, ordering, emphasis and evaluation of the material.

Bernier's independence of Gassendi emerged explicitly in his *Doutes de M. Bernier sur quelques uns des principaux chapitres de son Abrégé de Gassendi* (1682). His eleven doubts raise questions about Gassendi's views on space, time, motion, collision and other important topics. However, in the preface to the second edition published with the second and last edition of the *Abrégé*, Bernier says that he 'doubts no longer, having despaired of being able ever to understand any of [these questions]'.

Beyond this negative or academic scepticism, however, the Doutes contains a more consistent application of Gassendi's own empiricism and nominalism than anything found in Gassendi himself (see Nominalism). A good example is the treatment of space, which for Gassendi was an uncreated, incorporeal tridimensionality, a third kind of being that was neither substance nor accident. In addition to the ubiquitous theological objection that such a space would be independent even of God, and thus pose a rival divinity, Bernier argued that it would not have parts and that it would be imperceptible. His deepest argument was that space is nothing at all: for there to be space between two things, there need not be a third thing between them, any more than for two things to be equal there need be a thing - equality - to make them so. Equality and distance are 'abstract terms, which like all others of this sort, lead us into error if we conceive something abstract or separated from the concrete' (1684 II: 387-8).

Explicitly exempted from Bernier's critique is Gassendi's atomism, for he does not think that one can reasonably philosophize on any system other than that of atoms and the void. Yet even here Bernier gives arguments that extend Gassendi's position beyond physical theory in an adumbration of the metaphysical atomism of Hume.

Murr, S. (1992) 'Bernier et les Gassendistes', *Corpus* special double issue 20-1. The most extensive treatment ever accorded Bernier, comprising thirteen articles on topics related to him, and ten brief, rare texts either about or by him, including the *Requeste des maistres*.)

Bernstein, Eduard (1850-1932)

Eduard Bernstein, an eminent German social democrat, is now noted as 'the father of revisionism'. He made a reputation as the radical editor of the German Social Democratic Party organ, Der Sozialdemokrat, and became a close associate of Friedrich Engels. However, after the death of Engels he abandoned revolutionary Marxism and argued that socialism could be achieved by legal means and piecemeal reform. In doing this, he raised fundamental questions concerning the validity of Marxism and the direction of socialist political strategy, thus provoking what is now known as the 'revisionist debate'.

Eduard Bernstein was born in Berlin. In 1872, a year after the fall of the Paris Commune, he joined the *Eisenach* wing of the German socialist movement and soon became known as an activist. He attended the Gotha Conference in 1875, at which the *Eisenachers* joined with the *Lassalleans* to form what was to become the German Social Democratic Party (SPD). However, in 1878 the Reichstag passed legislation effectively making the SPD illegal, and Bernstein fled to Switzerland. Here, upon reading Engels' recently published *Anti-Dühring*, he became a Marxist. He made contact with Marx and Engels and laid the basis for a long and fruitful collaboration (particularly with Engels). Around the same time, he met Karl Kautsky, with whom he collaborated for many years. In 1881 he became editor of the official party organ, *Der Sozialdemokrat*, in which capacity he established a reputation as a Marxist of impeccable orthodoxy and the guardian of the party's radical conscience.

In 1887 Bernstein moved to London where he continued editing *Der Sozialdemokrat* and consolidated his relationship with Engels. But by this time Bernstein had begun to nourish doubts about revolutionary Marxism as a basis for party policy. The terminal crisis of capitalism, predicted by Marx and Engels, had not occurred and, as far as Bernstein could see, it was not going to occur. There was no evidence that the means of production were being concentrated in fewer and fewer hands, or that cut-throat competition was wiping out large sections of the middle classes, or that the proletariat was being relentlessly reduced to abject poverty. Capitalism seemed to be in robust good health and likely to remain so for the foreseeable future. It was, therefore, idle for socialists to pin their hopes on an imminent collapse of bourgeois society. On the other hand, the advance of democracy in most industrialized countries had enabled working-class parties to enter the political arena, and there was a real prospect that significant reforms could be achieved by parliamentary means. Indeed, Bernstein argued, the victory of socialism might well be accomplished by the steady implementation of socialist principles by democratic and constitutional means. In his view, it was not a matter of pursuing utopian visions. It was a matter of hard political work guided by basic socialist principles. 'The final goal of socialism' was, as he put it, 'nothing to me, the movement is everything' (Tudor and Tudor 1988: 168-9).

From these observations Bernstein drew two general conclusions. First, that Marx's doctrines would have to be re-evaluated and, where necessary, 'revised'. Second, the SPD should abandon its revolutionary aspirations and acknowledge that it was now a democratic socialist party of reform.

Bernstein developed these views, in part in a series of articles published in *Die Neue Zeit* under the title 'Problems of Socialism' and in part in a polemical exchange with the English socialist Ernest Belfort Bax (Tudor and Tudor 1988: 168-9). The consequent uproar within the party culminated in the rejection of Bernstein's 'revisionism' at the party conference at Stuttgart in 1898. Early in the following year Bernstein published his *Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie* (*The Preconditions of Socialism*). In it, he commended Marx and Engels for their open-ended, scientific approach. Their own investigations had, he argued, quite rightly led them to revise and qualify the initial formulations of their theories. They had, for instance, been the first to recognize the abstract nature (and therefore limited usefulness) of the theory of surplus value. They had, in their later years, amplified the materialist conception of history to allow political and ideological factors greater autonomy in effecting historical change. And they had modified their analysis of capitalist development in ways that made it less deterministic.

In Bernstein's view, these scientific advances pointed towards an evolutionary interpretation of the transition from capitalism to socialism. However, it was undeniable that Marx and Engels had drawn a different conclusion. They had never abandoned their revolutionary expectations. The reason for this, according to Bernstein, was that, to the very end, their thinking had been confined within the straightjacket of Hegelian dialectics. It was Hegelian

dialectics, not their painstaking scientific work, that ultimately dictated their conclusions. Scientific socialists should, Bernstein argued, emulate Marx the scientist, not Marx the dialectician.

Bernstein's own philosophical predilections were ill-defined. His view of science and knowledge was vaguely positivist in character, and in ethics he was much influenced by the neo-Kantians, particularly Friedrich Albert Lange (see Neo-Kantianism). However, he was not a professional philosopher. Apart from the opening chapters of *Preconditions*, the nearest he came to stating his philosophical position was in his 1901 lecture, 'How is Scientific Socialism Possible?' (1976). Here he argued that science, by its nature, is disinterested; it is mere cognition and cannot move men to action. Socialism, however, is a movement with aims and objectives, and these embody, not the results of scientific investigation, but the interests of the working class. In short, socialism does move men to action, it is not disinterested, and it therefore cannot be scientific.

The controversy provoked by Bernstein's views lasted for many years. His opponents included luminaries such as Georgii Plekhanov, Rosa Luxemburg and, above all, his old friend Karl Kautsky (see Plekhanov, G. §2). The party conferences at Hanover (1899) and Dresden (1903) were devoted mainly to Bernstein and the 'revisionist' question. Bernstein himself returned to Germany in 1901 where he continued his literary activity and, for most of the rest of his life, served as Reichstag deputy. After various political vicissitudes, he died in 1932.

Beth’s theorem and Craig’s theorem

Beth’s theorem is a central result about definability of non-logical symbols in classical first-order theories. It states that a symbol P is implicitly defined by a theory T if and only if an explicit definition of P in terms of some other expressions of the theory T can be deduced from the theory T. Intuitively, the symbol P is implicitly defined by T if, given the extension of these other symbols, T fixes the extension of the symbol P uniquely. In a precise statement of Beth’s theorem this will be replaced by a condition on the models of T. An explicit definition of a predicate symbol states necessary and sufficient conditions: for example, if P is a one-place predicate symbol, an explicit definition is a sentence of the form $(x)(Px \equiv \phi(x))$*, where* $\phi(x)$ *is a formula with free variable x in which P does not occur. Thus, Beth’s theorem says something about the expressive power of first-order logic: there is a balance between the syntax (the deducibility of an explicit definition) and the semantics (across models of T the extension of P is uniquely determined by the extension of other symbols).*

Beth’s definability theorem follows immediately from Craig’s interpolation theorem. For first-order logic with identity, Craig’s theorem says that if ϕ *is deducible from* ψ*, there is an interpolant* θ*, a sentence whose non-logical symbols are common to* ϕ *and* ψ*, such that* θ *is deducible from* ψ*, while* ϕ *is deducible from* θ*. Craig’s theorem and Beth’s theorem also hold for a number of non-classical logics, such as intuitionistic first-order logic and classical second-order logic, but fail for other logics, such as logics with expressions of infinite length.*

1 The axiomatic method

Questions concerning the definability of concepts arose within the development of the formal axiomatic method by late nineteenth- and twentieth-century mathematicians such as Moritz Pasch, Giuseppe Peano, David Hilbert and Alfred Tarski. What sets apart the formal axiomatic method from the earlier axiomatic thinking of, say, Euclid’s geometry is that the primitive terms occurring in the axioms are uninterpreted and the axioms devoid of any meaning; and that the rules of reasoning have been made completely explicit and formal. The axioms state purely formal relationships between the terms. This suffices for the purpose of deducing theorems from the axioms by rigorous reasoning. The development of the formal axiomatic method is the culmination of the movement to rigorize mathematics started in the early nineteenth century by mathematicians such as Cauchy and Bolzano. But these earlier efforts were directed chiefly towards ontology, for example, cleansing the language of analysis of visual images and reference to movement - and a mathematical theory still had subject matter, albeit abstract. In the formal axiomatic method the subject matter is provided from the outside by an interpretation of the primitive terms of the theory. One and the same theory may be open to radically diverse interpretations.

A perspicuous system of axioms requires under the formal axiomatic method the independence of each axiom from the others: a dependent axiom can be dropped without loss of content. Peano developed a method to prove independence: give an interpretation of the primitive terms which makes the one axiom false and the others true. This now common method is the formalization of an earlier idea of Eugenio Beltrami who felt that the so-called non-Euclidean geometry of Lobachevskii lacked a ‘real foundation’, that is a foundation in actual physical space. In 1868 Beltrami offered an interpretation of this geometry in terms of the acceptable Euclidean geometry: Lobachevskian ‘geometry’ could be understood as being about a special kind of line (a geodesic) in a special kind of plane (a surface with constant negative curvature) in Euclidean space. But Beltrami’s project was one of meaning and he did not have the consistency of non-Euclidean geometry in mind nor was he concerned with the independence of Euclid’s parallel axiom. In fact, only two years later, the French mathematician Guillaume Hoüel pointed out that Beltrami’s construction showed the independence of the parallel axiom: while the other axioms are true for all planes, the parallel axiom holds only in planes of zero curvature (see Scanlan 1988).

Another idea from the pre-formal period was absorbed by the formal axiomatic method through the work of the Italian mathematician Alessandro Padoa, a close collaborator of Peano. Padoa was concerned with the definability of concepts. He pointed out that there exists a parallel between, on the one hand, the methodological concepts of being an axiom and being derivable as a theorem and, on the other hand, concepts from the theory of definition: the notion of primitive term corresponds to the notion of being an axiom, and the notion of definability corresponds to the notion of deducibility. A perspicuous system of axioms therefore also requires the

independence of the primitive concepts used in the axioms. Padoa was thus led to ask in 1900 whether there could be a method to prove independence of concepts, just as Peano’s method had shown independence of axioms.

Early in the nineteenth century the French mathematician Jose Diez Gergonne had suggested the contrasting terms ‘explicit’ and ‘implicit’ as regards definition (Gergonne 1918-19). Gergonne’s distinction was suggested by the difference, in algebra, between a set of solved equations, which gives as it were explicit definitions of the unknowns, and a set of unsolved equations which is strong enough to determine a unique solution for the unknowns. Gergonne characterizes implicit definitions as ‘phrases that make us understand one of the words that occur in it through the known meaning of the other words’. Analogously to the algebraic case, Gergonne requires that the number of unknown words should be equal to the number of phrases that together implicitly define them. Completely forgotten by the end of the nineteenth century it was Giovanni Vacca, an assistant of Peano, who around 1896 gave a short account of Gergonne’s paper on definitions. Padoa’s paper (1901), read at the First International Congress of Philosophy in Paris, is clearly motivated by Gergonne’s work. To prove the independence of a concept from the other concepts occurring in a theory Padoa proposed a new method: find a true interpretation of the theory, considered as an abstract system, that remains a true interpretation when solely the meaning of that concept is changed. Thus, though Padoa did not refer to Gergonne or use the term ‘implicit definition’, his so-called ‘two-model method’ establishes that a term is not implicitly defined by a theory in the sense of Gergonne.

Since Padoa did not indicate how to construct the two models it may be better to speak of the ‘Padoa criterion’ for undefinability. Padoa claimed without further proof that his criterion was both necessary and sufficient for the explicit undefinability of a given concept by means of the other concepts in a given theory. Sufficiency is clear: if an explicit definition were to be implied by the theory two such models could not exist since the truth of the explicit definition would force the uniqueness of the interpretation of the explicitly defined term given an interpretation of the other terms. But necessity is not obvious. Does the absence of two such models guarantee that an explicit definition exists and is derivable? With hindsight this question could not have been answered at that time for it requires a more careful specification of the underlying logical system than was available to Padoa.

Alfred Tarski (1935) answered the question affirmatively for a modification of the ramified theory of types of Whitehead and Russell’s *Principia Mathematica* (see Theory of types). His proof was a rather straightforward derivation within the system, since the meta-claim that Padoa’s two models do not exist can be expressed in the language of type theory.

2 Beth’s theorem and Craig’s interpolation theorem

In 1953 the Dutch philosopher and logician Evert Beth proved the necessity of Padoa’s criterion for first-order or elementary logic. Beth showed that if no explicit definition of a term can be deduced from a theory, two models of the theory exist that differ only in the interpretation of the term in question. Moreover, in his so-called semantic tableau method, Beth found the means to construct systematically, in the absence of definability, the two models required by Padoa’s criterion, albeit often through an infinite process, while a closed tableau makes it possible to find an explicit definition of the term in question (see Natural deduction, tableau and sequent systems §4). Beth thus took away some of the concerns of the American mathematician Oswald Veblen who had remarked in 1902 that what Padoa proposed ‘seems hardly adequate’ when the issue was to replace an axiomatic system by one with independent axioms and independent terms, since he gave no method to find the two models and thus prove independence, or to construct the explicit definition, in the case of dependency.

Let *L* be a first-order language and *P* an arbitrary non-logical constant not in *L*. Let $L(P)$ denote the language obtained by adding *P* to *L*. To simplify our notation we will assume that *P* is a one-place predicate symbol. If *T* is an arbitrary theory in the language *L*, then $T(P)$ will be a theory in the language $L(P)$. Deducibility in first-order logic will be denoted by ‘$\vdash$’. An interpretation or model *M* for *L* specifies extensions in a domain *D* for all the non-logical constants of *L* (see Model theory). If *M* is a model of *L*, a model of $L(P)$ will be denoted by (M, X), where *X* is a subset of the domain *D* of *M*. Thus *P* is here interpreted as the subset *X*.

We will now define the notions of explicit and implicit definability. $T(P)$ is said to *define P explicitly* if there is a formula $\phi(x)$ of *L* such that $T(P) \vdash (x)(Px \equiv \phi(x))$. If *P* is not a one-place predicate symbol, this definition can be modified in the obvious way. Furthermore, let *T* be the set of first-order consequences of $T(P)$ in the

language *L*, in which *P* does nor occur. Then $T(P)$ is said to *define P implicitly* when, for every model *M* of *T*, there is exactly one expansion (M, X) of *M* which is a model of $T(P)$.

‘Beth’s definability theorem’ for first-order logic states that a theory $T(P)$ defines a term *P* implicitly if and only if $T(P)$ defines *P* explicitly. Beth’s original proof of 1956 uses a modification of Gentzen’s ‘extended *Hauptsatz*’, which shows that, in first-order logic, every proof can be carried out without any detours. Nowadays Beth’s theorem is usually proved to be a direct implication of Craig’s interpolation theorem.

‘Craig’s interpolation theorem’ for first-order logic with identity says that if a sentence ψ of first-order logic entails a sentence θ there is an ‘interpolant’, a sentence ϕ in the vocabulary common to θ and ψ, that entails θ and is entailed by ψ. William Craig originally proved this theorem as a lemma to be used in obtaining a simpler proof of Beth’s theorem (Craig 1957). Since then, however, the result has come to stand on its own.

We will now sketch a proof that Craig’s theorem implies Beth’s theorem. Since first-order logic is complete, implicit definability, a model-theoretic condition, is equivalent to the following deducibility condition, which is in fact Beth’s original definition of (implicit) definability. Let P' be a one-place predicate not in *L* and distinct from *P*, and let $T(P')$ be the theory in $L(P')$ obtained by replacing *P* by P' in $T(P)$ wherever it occurs. Then *P* is implicitly defined by $T(P)$ if and only if $T(P) \cup T(P') \vdash (x)(Px \equiv P'x)$. Assume now that this condition holds, and that $T(P)$ is a finite set of sentences, or, rather, one big conjunction of axioms, and similarly for $T(P')$. So we can write $T(P)\ \&\ T(P') \vdash (x)(Px \equiv P'x)$. But then also $T(P)\ \&\ Pc \vdash (T(P') \rightarrow P'c)$, where *c* is a new individual constant not in *L*. By Craig’s theorem there is an interpolant $\phi(c)$ such that $T(P)\ \&\ Pc \vdash \phi(c)$ and $\phi(c) \vdash (T(P') \rightarrow P'c)$. Since P' does not occur in $\phi(c)$ it is also true that $\phi(c) \vdash (T(P) \rightarrow Pc)$. Thus $T(P) \vdash (Pc \equiv \phi(c))$. Since *c* does not occur in $T(P)$, we also have $T(P) \vdash (x)(Px \equiv \phi(x))$. This completes the proof that if $T(P)$ defines *P* implicitly, then $T(P)$ defines *P* explicitly. The other direction of Beth’s theorem follows independently of Craig’s theorem.

3 Further developments and applications

Again, let *T* be the set of first-order consequences of $T(P)$ in the language *L*. We said that $T(P)$ defines *P* implicitly when for every model *M* of *T* there is exactly one expansion (M, X) which is a model of $T(P)$. In Padoa’s method two models (M, X) and (M, X') of $T(P)$ are exhibited. Another way in which implicit definability can be violated is if there is a model of *T* that cannot in any way be expanded to a model of the full $T(P)$. Karel de Bouvère (1959) studied this so-called one-model method to show undefinability of addition and multiplication in number theory. In the philosophy of science literature this is called a failure of Ramsey eliminability of the term.

Not to be confused with the above concept of definability of a term in a theory is the concept of definability of a set in a model which, for Tarski, belongs to semantic definability rather than to the formal definability involved in Padoa’s question since now we have a fixed model for an interpreted language. Given a model *M* of *L*, a subset *X* of its domain *D* is *definable in the model M* if there is a formula of *L* with one free variable $\phi(x)$ such that $(x)(Px \equiv \phi(x))$ is true in (M, X), where *P* is interpreted as *X*. Obviously, if *P* is explicitly definable in $T(P)$ and if (M, X) is a model of $T(P)$, then *X* is definable in *M*. Moreover, the concept of definability in a model can be iterated, whereas definability of a term in a theory cannot since a set of terms is not itself a term of the language.

We say that the predicate *P* is definable in a model (M, X) of $T(P)$ if an explicit definition of *P* holds in (M, X). Different models of $T(P)$ may satisfy different, non-equivalent definitions. But a theorem proven by Lars Svenonius in 1959 shows that if *P* is definable in every model (M, X) of $T(P)$ then each model (M, X) of $T(P)$ satisfies one of a finite list of definitions. That is, $T(P)$ implies a (finite) disjunction of explicit definitions of *P*. This property is called ‘explicit definability up to disjunction’ or ‘piecewise definability’.

In model theory the concept of ‘a logic’ is defined and logics for which Craig’s interpolation theorem hold are said to have the Craig or interpolation property; similarly for the Beth property. Any usual logic with the Craig property has the Beth property, but the latter has been shown to be weaker.

Bhartṛhari (*c*. 5th century)

Bhartṛhari is the Indian philosopher of grammar par excellence. *Drawing on practically all the schools of thought of his time - religious, philosophical, linguistic and ritual - he uses elements from them to create a philosophy. This philosophy, while claiming to be grammatical, goes far beyond traditional grammar, constituting a new and remarkably original system of thought.*

1 Life, works and influence

Bhartṛhari is the author of the *Vākyapadīya* or *Trikāṇḍī* and probably the *Mahābhāṣyaṭīkā* or *Mahābhāṣyadīpikā*, perhaps the earliest commentary on the *Mahābhāṣya* of Patañjali, which survives only in part. The Indian tradition also ascribes to Bhartṛhari the *Vākyapadīyavṛtti*, the earliest surviving commentary on the first two books of the *Vākyapadīya*, but this is doubtful.

Bhartṛhari was long believed to have lived in the seventh century AD, according to the testimony of the Chinese pilgrim Yijing (eighth century AD). However, as his *Vākyapadīya* was known to the Buddhist philosopher Dignāga, this has pushed his date back to the fifth century AD. It is unlikely that Bhartṛhari was active any earlier than Kālidāsa, a famous Sanskrit poet and playwright, who is widely believed to allude to the Gupta emperor Candragupta II (375-413 AD).

The philosophy of Bhartṛhari is expressed in the *Vākyapadīya*, a difficult work whose serious scholarly study remains in its infancy. Later grammarians claim Bhartṛhari's philosophy to be inseparable from the grammatical tradition and cite from the *Vākyapadīya* selectively. However, other thinkers, such as Abhinavagupta and Dharmapāla found aspects of his text with which they concur. The Buddhist Dharmapāla is known to have written a commentary (now lost) on part of the *Vākyapadīya* and the Chinese pilgrim Yijing mistook Bhartṛhari for a Buddhist. Hindu Tantric thinkers (especially Abhinavagupta) took a deep interest in Bhartṛhari's work. His philosophy is also often looked upon as a form of Vedānta (see Vedānta). All these links and claims are justified by certain aspects of Bhartṛhari's thought, but they do not provide an integrated picture of his philosophy.

2 Philosophical outline

In order to understand Bhartṛhari on his own terms, he must be read in the context of his time. The *Vākyapadīya* must be understood against the background of the philosophical and religious currents with which Bhartṛhari was acquainted and to which he refers, although often implicitly. These references show that Bhartṛhari was a Vedic *brāhmaṇa* (most probably belonging to the Maitrāyaṇīya branch of the black Yajurveda), who was strongly influenced by the Vaiśeṣika philosophy and especially by Mādhyamika Buddhism (see Nyāya-Vaiśeṣika; Buddhism, Mādhyamika: India and Tibet). He was first and foremost a grammarian who claimed allegiance to Patañjali and tried to elevate grammatical studies to the rank of a philosophy with the further implication that its study would provide access to liberation. Bhartṛhari combined these and other ideas to produce a philosophy of his own for which he claimed no originality. However, his work stands apart from all that preceded and followed him, including the philosophy of the later grammarians who present themselves as his inheritors.

Modern scholarship has not yet reached agreement on the precise nature of Bhartṛhari's philosophy. His philosophy distinguishes between two levels of reality, a higher and a lower. Only the higher reality can be considered to be real; lower reality is not real in an absolute sense. Language cannot describe higher reality. Indeed, language plays a major role in bringing about the lower reality, which is the reality of everyday experience. The resemblance between these ideas and those current among the Buddhists of the time is striking. There are, however, a number of major differences. First, for Bhartṛhari language is not just any language: it is Sanskrit, the sacred language of the Brahmans, which took form in the Veda, the corpus of canonical texts believed to be eternal. The world of everyday experience is in this way created, or organized by the Veda. At this point, Bhartṛhari turns an essentially Buddhist argument into a confirmation of the pre-eminence of the Veda.

A second major difference concerns the nature of the higher, absolute reality. Variant schools of Buddhism had various ideas about this, depending on the school to which they belonged: consciousness, emptiness, the fundamental elements of existence (*dharma*). Bhartṛhari accepts none of these positions. For him the absolute is the totality of all there is, has been and will be. He used this idea, borrowed from earlier Brahmanical thinkers, as

an element in his own philosophy.

Lower reality is the result of a division of the absolute. The precise nature of this division is determined, among other things, by language. Sometimes Bhartṛhari also mentions analytical imagination (*vikalpa*), but there is reason to believe that he looked upon these different factors as amounting to the same thing. The ‘parts’ resulting from this division undergo the influence of a number of powers (*śakti*) of the absolute, foremost among them time and space. These operations bring about the objects of everyday experience, which are accordingly looked upon as consisting of ‘real’ and ‘unreal’ parts. Bhartṛhari is not categorical as to what constitutes the ‘real’ parts of familiar objects. Among the various possibilities he proposes are that the substance of, or the universal inhering in the object is its ‘real’ part. He does not choose between these alternatives. This is due to what J.E.M. Houben (1995) has called Bhartṛhari’s perspectivism: reality is different from different points of view. This perspectivism is a pervading characteristic of Bhartṛhari’s thought. It applies to lower reality, but not to the absolute.

Bhartṛhari’s vision of the absolute as the totality of all that exists, has existed and will exist, has repercussions in the realm of ordinary reality. For Bhartṛhari, any totality or whole is more real than its constituents. A vase, for example, is more real than its parts. Again we see how Bhartṛhari uses a Buddhist position for his own purposes, by turning it into its opposite. For the Buddhists wholes do not exist: only their ultimate parts (*dharma*) (see Buddhist philosophy, Indian). To Bhartṛhari, a whole is more real than its parts and the absolute whole is absolutely real.

3 Role of grammar

Bhartṛhari considers himself a grammarian. Generally, grammar deals with the analysis of language and produces words from stems and suffixes. Language also obeys the general rule that totalities are more real than their constituents. This is particularly clear in the case of words which convey meaning, whereas their constituents do not. Grammatical analysis, Bhartṛhari argues, is artificial as stems and suffixes are the inventions of grammarians. In this respect his position appears to be very close to that of Patañjali. Words, too, are merely the result of an artificial analysis of sentences which, in their turn, are parts of more encompassing and therefore more real, linguistic units.

Once again, Bhartṛhari uses ideas which he borrowed from Buddhism. The Sarvāstivādins postulated long before Bhartṛhari the existence of three entities (*dharma*), corresponding to individual phonemes, words and sentences. Bhartṛhari accepts these entities, but orders them in an hierarchical ontology in agreement with his overall vision of reality.

Grammar allows its practitioner to ‘ascend’ from the smallest elements isolated by grammatical analysis, such as phonemes, stems and suffixes, to ‘higher’ units of speech. This way he will learn about the world, which is largely determined by the linguistic analysis that is imposed upon it. He will also learn to appreciate the unreality of the everyday world. In the end, the realization that the highest reality is beyond language and concerns the totality of things can be attained. Insight into the all leads to liberation, as it does in a number of classical texts of Mahāyāna Buddhism. It is in this sense that Bhartṛhari states at the beginning of his *Vākyapadīya* that grammar is the door to liberation.

Bhartṛhari’s remarks concerning the nature of language should be understood in the light of the above. There has been much confusion among recent scholars about Bhartṛhari’s concept of the absolute, which is often depicted as being of the nature of speech. The *Vākyapadīya* does not support this point of view. Bhartṛhari does discuss the distinction between the real word, sometimes called *sphoṭa* and the sounds which manifest it. The real word, he believes, has no sequence. It is only the sounds that manifest it which are sequential. Among the manifesting sounds, he makes a distinction between primary (*prākṛta*) and secondary (*vaikṛta*) sounds. The former have the duration attributed to the real word, the latter are responsible for the differences of pronunciation between different speakers. Bhartṛhari’s perspectivism in the *Vākyapadīya* is pertinent here, implying that a different explanation of the same fact may be presented elsewhere in the same text without clear indication to that effect. As well as this explanation of the duration of a word in terms of primary sounds (*Vākyapadīya* 1.77) there are verses in the text (1.105-6), which speak of the *sphoṭa* as the first sound produced, whose duration is not affected by the sounds produced subsequently.

Bible, Hebrew

Although the Bible is not a work of systematic philosophy, it none the less contains a wide variety of philosophical and theological ideas which have served as the framework for rabbinic speculation through the centuries. Although these views about the nature and activity of God are not presented systematically, they do provide an overview of the ancient Israelite understanding of the Godhead, creation, divine providence and human destiny. Throughout rabbinic literature these notions served as the bedrock for theological speculation, and with the emergence of systematic Jewish philosophy in the Middle Ages, they came to preoccupy a variety of thinkers. Similarly, in the post-Enlightenment period until the present, scriptural teaching has served as the starting point for philosophical and theological reflection.

Foremost among scriptural beliefs is the conviction that one God has created the cosmos. As the transcendent creator of the universe, he reigns supreme throughout nature and is intimately involved in earthly life. God is both omnipotent and omniscient and exercises divine providence over all creatures - from on high he oversees all the inhabitants of the earth. In exercising his providential care, Scripture repeatedly asserts, God is a benevolent ruler who shows compassion and mercy to all. Furthermore, as lord of history, he has chosen Israel to be his special people and has revealed the Torah to them on Mount Sinai. The Jewish people are to be a light to the nations, and from their midst will come a Messianic redeemer who will inaugurate a period of divine deliverance and eventually usher in the world to come. Israel thus plays a central role in the unfolding of God's plan for all human beings.

1 l Divine unity

Pre-eminent among scriptural ideas is belief in the existence of one God. In the Hebrew Bible, the Israelites experienced God as the lord of history. The most uncompromising expression of his unity is the *Shema* prayer: ‘Hear, O Israel, the Lord, our God, is one Lord’ (Deuteronomy 6: 4). According to Scripture, the universe owes its existence to the one God, the creator of heaven and earth, and since all human beings are created in his image, all men and women are brothers and sisters. Hence the belief in one God implies that there is one humanity and one world (see God, concepts of).

Jewish biblical teaching therefore emphasizes that God alone is to be worshipped. As the prophet Isaiah declared, ‘I am the Lord, and there is no other, besides me there is no God;… I form light and create darkness, I make weal and create woe, I am the Lord, who do all these things’ (Isaiah 45: 5, 7).

2 Transcendence and immanence

For the biblical writers, God is conceived as the transcendent creator of the universe. Thus in Genesis 1: 1-2, he is depicted as forming heaven and earth: ‘In the beginning God created the heavens and the earth. The earth was without form and void, and darkness was upon the face of the deep; and the Spirit of God was moving over the face of the waters’. Throughout Scripture this theme of divine transcendence is repeatedly affirmed. Thus Isaiah proclaims:

> Have you not known? Have you not heard? Has it not been told you from the beginning? Have you not understood from the foundations of the earth? It is he who sits above the circle of the earth, and its inhabitants are like grasshoppers; who stretches out the heavens like a curtain and spreads them like a tent to dwell in.
>
> (Isaiah 40: 21-2)

Later in the same book Isaiah declares that God is beyond human comprehension: ‘For my thoughts are not your thoughts neither are your ways my ways, says the Lord. For as heavens are higher than the earth, so are my ways higher than your ways and my thoughts than your thoughts’ (Isaiah 55: 8-9).

In the book of Job the same idea is repeated - God's purposes transcend human understanding:

> Can you find out the deep things of God? Can you find out the limit of the Almighty? It is higher than heaven - what can you do? Deeper than Sheol - what can you know? Its measure is longer than the earth, and broader than the sea.
>
> (Job 11: 7-9)

According to the author of Ecclesiastes, God is in heaven whereas human beings are confined to the earth. Thus the wise should recognize the limitations of human knowledge: ‘Be not rash with your mouth, nor let your heart be hasty to utter a word before God, for God is in heaven, and you upon earth; therefore let your words be few’ (Ecclesiastes 5: 2). Despite this view of God’s remoteness from his creation, he is also viewed as actively involved in the cosmos. In the Bible, his omnipresence is stressed repeatedly. Thus the Psalmist rhetorically asks:

> Whither shall I go from thy Spirit? Or whither shall I flee from thy presence? If I ascend to Heaven, thou art there! If I take the wings of the morning and dwell in the uttermost parts of the sea, even there thy hand shall lead me.
>
> (Psalms 139: 7-12)

Throughout Scripture, God is also described as having neither beginning nor end. Thus the Psalmist stated, ‘Before the mountains were brought forth, or ever thou hadst formed the earth and the world, from everlasting to everlasting thou art God. (Psalms 90: 2).

In the Bible, the term *olam* is most frequently used to denote the concept of God’s eternity. In Genesis 21: 33 he is described as the Eternal God; he lives for ever (Deuteronomy 32: 40) and reigns forever (Exodus 15: 18; Psalms 10: 16). He is the living God and everlasting King (Jeremiah 10: 10); his counsel endures for ever (Psalms 33: 11) as does his mercy (Psalms 106: 1). For the biblical writers, God’s eternal existence is different from the rest of creation - he exists permanently without beginning or end (see God, concepts of).

3 Omnipotence and omniscience

Concerning God’s power, the belief in his omnipotence has been a central feature from biblical times. Thus in Genesis when Sarah expressed astonishment at the suggestion that she should have a child at the age of ninety, she was criticized: ‘The Lord said to Abraham, "Why did Sarah laugh, and say ‘Shall I indeed bear a child now that I am old?’ Is anything too hard for the Lord?"’ (Genesis 18: 13-14). Similarly, in the book of Jeremiah when the city of Jerusalem was threatened by the Chaldeans, God declared: ‘Behold, I am the Lord the God of all flesh: is anything too hard for me?’ (Jeremiah 32: 27). On such a view there is nothing God cannot do: what appears impossible is within his power (see Omnipotence).

Similarly, Scripture affirms that God is all-knowing (see Omniscience). As the Psalmist states, ‘The Lord looks down from heaven, he sees all the sons of men… he who fashions the hearts of them all, and observes all their deeds’ (Psalms 33: 13, 15).

4 Creation and providence

Turning from God’s attributes to his acts, Scripture declares that he created the universe:

> In the beginning God created the Heaven and the Earth. The Earth was without form and void, and darkness was upon the face of the deep; and the Spirit of God was brooding over the face of the waters. And God said, ‘Let there be light’: and there was light. And God saw that the light was good.
>
> (Genesis 1: 1-4)

That God controls and guides the universe is an essential belief. The Hebrew term for such divine action is *hashgahah*, derived from Psalm 33: 14: ‘From where He sits enthroned He looks forth (*hishgiah*) on all the inhabitants of the earth’. Such a view implies that the dispensation of a wise and benevolent providence is found everywhere - all events are ultimately foreordained by God. According to tradition, there are two types of providence: (1) general providence, God’s provision for the world in general, and (2) special providence, God’s care for each individual. In Scripture God’s general providence was manifest in his freeing the ancient Israelites from Egyptian bondage and guiding them to the Promised Land. The belief in the unfolding of his plan for salvation is a further illustration of such providential care for his creatures. Linked to this concern for all is God’s providential concern for every person. In the words of the prophet Jeremiah: ‘I know, O Lord, that the way of man is not in himself, that it is not in man who walks to direct his steps’ (Jeremiah 10: 23) (see Creation and conservation, religious doctrine of; Providence).

5 Goodness, revelation and sin

In exercising divine providential care for creation, Scripture repeatedly asserts that God is the all-good ruler of the universe. Thus in the Psalms, he is depicted as good and upright (25: 8); his name is good (52: 11; 54: 8); he is good and ready to forgive (86: 5); he is good and does good (118: 68); he is good to all (l45: 9). Throughout the biblical narrative God is viewed as the supremely beneficent creator who guides all things to their ultimate destiny. In the unfolding of his plan, he chose Israel as his messenger to all peoples. As creator and redeemer, he is the father to all. Such affirmations about God's goodness have given rise to intense speculation about the mystery of evil. In Scripture the authors of Job and Ecclesiastes explored the question why the righteous suffer, and this quest continued into the rabbinic period (see Goodness, perfect; Evil, problem of).

The Hebrew Bible also asserts that God revealed himself in history. According to tradition, God revealed 613 commandments to Moses on Mount Sinai: they are recorded in the Five Books of Moses (Genesis, Exodus, Leviticus, Numbers and Deuteronomy). These prescriptions, which are to be observed as part of God's covenant with Israel, are classified in two major categories: (l) statutes concerned with ritual performances characterized as obligations between human beings and God; and (2) judgments consisting of laws that would have been adopted by society even if they had not been decreed by God (such as laws regarding murder and theft). These 613 commandments consist of 365 negative prescriptions (prohibited) and 248 positive prescriptions (duties to be performed) (see Revelation).

For the biblical writers, sin is understood as a violation of these divine decrees. In Scripture the word *chet* (sin) means 'to miss' or 'to fail'. Here sin is understood as a failing, a lack of perfection in carrying out one's duty. The term *peshah* means a 'breach'; it indicates a broken relationship between human beings and God. The word *avon* expresses the idea of crookedness. Thus according to biblical terminology, sin is characterized by failure, waywardness and illicit action. A sinner is one who has not fulfilled his obligations to God.

6 The chosen people

A central feature of biblical Judaism is the belief that God chose the Jews as his special people. In the Bible the Hebrew root *b-h-r* (to choose) denotes the conviction that God selected the Jewish nation from all other peoples. As the book of Deuteronomy declares, 'For you are a people holy to the Lord your God: the Lord your God has chosen you to be a people for his own possession out of all the peoples that are on the face of the earth' (Deuteronomy 7: 6). According to Scripture, this act was motivated by divine love: 'It was not because you were more in number than any other people that the Lord set his love upon you and chose you, for you were the fewest of all peoples; but it is because the Lord loves you' (Deuteronomy 7: 7-8). Through its election Israel has been given an historic mission to convey divine truth to humanity. Thus, before God proclaimed the Ten Commandments on Mount Sinai, He admonished the people to carry out this appointed task:

> You have seen what I did to the Egyptians, and how I bore you on eagles' wings, and brought you to myself. Now therefore, if you will obey my voice, and keep my covenant, you shall be my own possession among all peoples; for all the earth is mine, and you shall be to me a kingdom of priests and a holy nation.
>
> (Exodus 19: 4-6)

God's choice of Israel thus carries with it numerous responsibilities. As God declares regarding Abraham in Genesis, 'For I have chosen him, that he may charge his children and his household after him to keep the way of the Lord by doing righteousness and justice' (Genesis 18: 19).

Divine choice demands reciprocal response. Israel is obliged to keep God's statutes and observe his laws. In doing so, the nation will be able to persuade the peoples of the world that there is only one universal God. Israel is to be a prophet to the nations, in that it will bring them to salvation. Yet despite this obligation, the Bible asserts that God will not abandon his chosen people even if they violate his covenant. The wayward nation will be punished, but God will not reject them: 'Yet for all that, when they are in the land of their enemies, I will not spurn them, neither will I abhor them so as to destroy them utterly and break My covenant with them: for I am the Lord their God' (Leviticus 26: 44).

As God's chosen people, Israel is to inherit a land of its own. Thus, in Genesis, God calls Abraham to travel to Canaan, where he promises to make him a great nation: 'Go from your country and your kindred and your

father's house to the land that will show you. And I will make of you a great nation' (Genesis 12: 1-2). This same declaration was repeated to Abraham's grandson Jacob who, after wrestling with God's messenger, was renamed Israel. After Jacob's son Joseph became vizier in Egypt, the Israelite clan settled in Egypt for several hundred years. Eventually Moses led them out of Egyptian bondage and the people settled in the land that was promised to their ancestors.

7 The Messiah

In the unfolding of God's providential plan for Israel and humanity, the Messiah is to play a pivotal role. The term 'Messiah' is an adaptation of the Hebrew *Ha-Mashiach* (the Anointed), a term used frequently in Scripture. Initially, in the Book of Samuel, the view was expressed that the Lord had chosen David and his descendants to reign over Israel to the end of time (2 Samuel 7; 23: 1, 3, 5). Eventually there arose the belief that the house of David would return in time to rule over the two divided kingdoms as well as neighbouring peoples. Such an expectation paved the way for the vision of a transformation of earthly life through a universal Messianic redemption.

Biel, Gabriel (before 1425-95)

Biel was the last great systematizer of scholastic theology and philosophy. Not noted for originality, he sought to produce a synthesis of the work of his predecessors. His thought is pervasively religious; a profound sense of the freedom of God's will is basic to his perspective. He followed Ockham and Duns Scotus in emphasizing the sheer contingency of things. Nature, morality and salvation depend entirely on God's will, and God could have determined otherwise. Such a view places sharp limits on the ability of reason to discover the truth about the nature and will of God; Biel subordinates reason to faith (although he is a master in the use of reason to defend revealed truth). The radical freedom of God coexists with significant moral freedom in humanity, since it is decreed by God that humans should be free to play an active role in determining their own destiny. Implied in this view of the human situation is an activist, pragmatic tendency, an interest in concrete applications of theoretical insights rather than in abstract speculation for its own sake.

1 Life

Gabriel Biel was born sometime before 1425 at Speyer, and died on 7 December 1495, at Einsiedel in Schönbuch. He was the last and arguably the ablest champion of 'the modern way' in late medieval theology (that is, a nominalism based on the system of William of Ockham). He studied at Heidelberg (BA 1435; MA 1438), Erfurt (1442-3, 1451-3) and Cologne (from 1453). At Erfurt he was exposed to Ockham's thought, at Cologne to that of Albert the Great and Thomas Aquinas. Biel assumed the chair in theology at Tübingen in 1484; he was invested as rector in 1485 and again in 1489.

Pragmatic and spiritual concerns are interwoven into Biel's intellectual enterprise. His perspective is more pervasively pastoral and religious than is Ockham's. The deeply religious tone of Biel's thought reflects his role as a cathedral-preacher in Mainz and as a proponent of the 'modern devotion' (*devotio moderna*) throughout southern and central Germany. His concerns for spiritual guidance and moral growth find abundant expression in his *De communi vita clericorum (On the Common Life of Clerics)* (1468-77), *Canonis misse expositio (Exposition of the Canon of the Mass)* (1488) and *Collectorium circa quattuor libros Sententiarum (Commentary on the Four Books of Sentences)* (1501).

2 Practical concerns

The coherence of Biel's thought is derived from his commitment to Ockhamism. Although he consults other theologians on subjects that Ockham fails to treat in depth, Ockham's perspective provides the framework within which he appropriates their work. Yet Biel is no narrow partisan. He is eager to synthesize the best elements from the competing traditions of late medieval thought - the 'ancient way' (*via antiqua*) of Aquinas and Duns Scotus and the 'modern way' (*via moderna*) of Ockham and his disciples. Biel's thought is eclectic in the best sense: emphatic about his loyalty to Ockham's perspective, he does not hesitate to draw on the wisdom of Bonaventure, Aquinas and above all Duns Scotus. A wide-ranging dialogue with various philosophers and theologians makes Biel's work valuable as an encyclopedic overview of the diversity in Western thought at the end of the Middle Ages.

Biel seeks an integration not only of the ancient and modern 'ways' but also of knowledge and piety. His *Canonis misse expositio* (1488) is a remarkable example of the symbiosis between late medieval theology and spirituality.

The pragmatic tendency of Biel's thought can be seen in the attention he pays to social ethics, and the practical consequences of theological conclusions. This is seen most clearly in the fourth book of his *Collectorium circa quattuor libros sententiarum* (1501), where Biel explores the sources of legitimate political authority, the mutual obligations of rulers and citizens, the morality of usury and the place of money in a just economy. Biel's contributions to a modern economic perspective include his vindication of the role of money in economic transactions and of supply and demand (rather than abstract theoretical considerations) as determining a just price.

3 Human nature and justification

This practical emphasis is reflected in an activist impulse that is linked with Biel's optimism about the moral

potentialities latent in human nature: ‘To those who do what in them lies, God does not deny his grace’ (*Canonis misse expositio*, lect.59(D); II *Sent.* d.27 q.1 a.3 dub.3 (N)). Oberman (1963) regarded Biel’s doctrine of justification as ‘essentially Pelagian’, since Biel exalts the sinner’s ability to take certain crucial steps towards repairing the effects of sin by utilizing purely human moral resources, quite apart from any special enablement by God’s grace (see Pelagianism; Justification, religious §3). Others (Clark 1965; Ernst 1972; McGrath 1981) have contested that verdict. The themes of covenant and divine generosity make it clear that for Biel the ultimate basis of salvation is God’s mercy rather than human achievement. Furthermore, Biel teaches that the preparation for grace and the infusion of grace are simultaneous: even though the preparation of the soul for justification is accomplished without the assistance of grace, still there is never a moment when the required disposition for grace (sorrow for sin based on love for God above all things) exists in one who is not a recipient of grace (see Grace §2). Yet Biel’s doctrine seems at least quasi-Pelagian: a rhetoric of grace cloaks a spirituality of self-reliance. What Biel’s theology arouses is not a sense of dependence on the enablement of grace but rather an imperative to do what one can and must do for oneself. To be sure, Biel insists that sinners cannot save themselves or take the first step towards reconciliation with God; the process leading to justification begins with a covenant whose source is sovereign mercy, preceding every human act of goodness or merit. It is gracious that God established a covenant at all, gave the Law as a guide to its fulfilment, sent Jesus as Teacher/Example, created humanity with the moral endowment of conscience, reason, synderesis (an innate tendency of the will to prefer the good over the evil) and freedom, which make it possible (in some limited sense, at least) for sinners to merit the first grace. Once God has taken the initiative, however, Biel interprets the actual economy of salvation in such a way that the decisive issue is what the sinner’s free response will be. Technically, Biel’s doctrine may not be Pelagian, but for all practical purposes (psychologically and morally), it might as well be.

4 Nominalism, voluntarism and fideism

On the hotly-debated question of the ontological status of universals, Biel articulates a nominalist position, reflecting and reinforcing the inclination of his thought towards the concrete rather than the abstract (see Nominalism). Universals are merely names, applied arbitrarily to categories of entities; only individuals are actual existents. Other philosophical themes emerge from Biel’s doctrine of God, which follows Duns Scotus’ voluntarism in emphasizing God’s absolute freedom from any external necessity. The realm of what God could do, if God so willed, is limited only by the law of non-contradiction. Anything that is logically possible is a real possibility for omnipotence. From the infinite possibilities available, God freely chose a finite number to be actualized, but might have chosen differently (see Omnipotence §5). In the ultimate freedom of the divine will, God could have decided to create a vastly different physical, moral or salvific order; everything is utterly contingent on God’s absolutely free decision. This implies a radical contingency in the actual order of things. Right and wrong are defined by the arbitrary act of the divine will, for which no prior reason may be sought. ‘It is right because God wills it’ (*Canonis misse expositio*, lect.23 (E)), not vice versa. Biel is a master of dialectics in the service of revealed truth, but his voluntarism motivates a radical critique of the scope of reason’s competence. Reason can manipulate logical possibilities, but in the actual order of morality and piety, reason is powerless to discern the content of the divine will, which must be communicated through authority and accepted by a faith that is submissive to God’s revelation (in Scripture and tradition), interpreted according to the determination of the Church and, above all, the Pope. Biel seeks to be faithful, not original. His personal modesty combines with an emphasis on the primacy of faith over reason to foster an attitude of submission to the Church and a high view of papal supremacy.

5 Influence

Biel’s writings underwent numerous editions. His admirers included Johannes Altenstaig, Johann Eck and Wendelin Steinbach. Influential at the Council of Trent, Biel’s ideas continued over several centuries to be an important resource for a wide range of Roman Catholic thinkers.

The young Luther (§1) was a diligent student of the *Expositio* and *Collectorium*, but Biel’s relation to Luther is complex. Luther’s doctrine of justification is a massive assault on Biel’s synergism. Yet on several key issues, Luther’s theology betrays a basic continuity with Biel’s thought. Luther’s high view of the sacraments is faithful to much of what he learned from Biel. Biel’s voluntarism sets the stage for Luther’s radical view of divine sovereignty: God’s will is the sole basis for human salvation. When Luther stresses God’s hiddenness and calls

reason ‘the devil’s whore’, echoes of Biel’s fideism are unmistakable. Yet Luther’s dialectical skills were moulded by his early exposure to the clarity and rigour of Biel’s logic.

Bioethics

While bioethics, a part of applied ethics, is usually identified with medical ethics, in its broadest sense it is the study of the moral, social and political problems that arise out of biology and the life sciences generally and involve, either directly or indirectly, human wellbeing. Thus, environmental and animal ethics are sometimes included within it. In this regard, bioethics can be of broader concern than is either medical/biomedical ethics or the study of the moral problems that arise out of new developments in medical technology.

The interrelated issues of who or what has moral status, of what justifies a certain kind of treatment of one creature as opposed to another, and whether, if a creature has moral status, it can lose it, have proved especially important issues in this broadest sense of bioethics. The philosophical task of probing arguments for soundness appears essential to deciding these issues.

As a part of applied ethics, bioethics is exposed to the difficulty that (1) we do not agree in our moral convictions and principles about many of the cases that feature in bioethics, (2) we do not agree in the moral theories in which our moral principles find their home and by which we try to justify them, and (3) we do not agree in the test(s) of adequacy by which to resolve the disagreements at the level of moral theory. We seem left with no way of deciding between contending principles and theories.

1 Conceptions of bioethics

In contemporary discussions of applied ethics, the term ‘bioethics’ is used generally in three ways.

Narrowly, it refers to a number of moral problems that attend recent developments in biotechnology, especially developments in four overlapping areas. These areas concern life-saving technologies at the beginning and end of life, life-enhancing technologies to improve the quality of life, reproductive technologies, the technologies to do with genetic engineering and gene therapy, and the implications for humans of the recently announced technology for cloning sheep. It is morally difficult to decide when and how to use these various technologies. For example, advances in our ability to correlate diseases and illnesses with particular genes and advances in gene therapy/gene replacement obviously raise important moral issues about how we are to use and control this ability and the information about individuals that genetic testing increasingly yields us. Again, even rather small developments in reproductive technology raise the spectre in some countries, for example, of aborting foetuses of the ‘wrong’ sex (see Genetics and ethics).

More broadly, and much more commonly, ‘bioethics’ refers to medical ethics generally and to all the various problems - moral, social, political, economic - that arise therein, including those moral issues to do with the development of biotechnologies encompassed by the narrower view. Resource allocation, informed consent, abortion, euthanasia, physician-assisted suicide, surrogate motherhood, the doctor/patient relationship, genetic engineering/genetic enhancement: on this broader usage, all form part of bioethics (see Suicide, ethics of; Life and death; Reproduction and ethics). Since medical ethics has been perhaps the major growth area of applied ethics, this broader usage of the term ‘bioethics’ has become dominant in the Anglo-American world (see Medical ethics).

More broadly still, and in keeping with V.R. Potter’s introduction of the term (1971), ‘bioethics’ refers to the moral, social and political problems that arise from biology and the life sciences generally and that involve, directly or indirectly, human wellbeing. On this broadest usage, environmental ethics and animal ethics are parts of bioethics, though it should also be noted that Anglo-American medical ethicists increasingly include concerns to do with animals within their brief and so seek, at least in part, to incorporate these concerns into medical ethics (see Animals and ethics; Environmental ethics; Agricultural ethics).

Accordingly, there is no specific discipline that is bioethics. Rather, there are sets or series of moral problems that arise out of biotechnologies, medicine, and human interaction with animals and the environment and that, directly or indirectly, affect human wellbeing. Which set of problems is emphasized can vary among philosophers and ethicists generally, and some sets have come to be so widely discussed that they have taken on a life of their own. Thus, some issues in environmental ethics (such as whether and how an ecosystem has value) and a great many issues in animal ethics (including the moral status of animals and their use as experimental subjects) flourish in their own right, whatever their relationship to human medicine and biotechnology. Again, so prominent have the

problems of medical ethics become that medical ethicists, including those who speak of ‘biomedical ethics’, rarely engage directly with environmental issues. As indicated, the case of animal ethics is more complicated here, since the moral problems that surround medical experimentation upon animals for human benefit are increasingly regarded as important issues of medical ethics.

2 The role of the philosopher

Bioethics is a part of applied ethics (see Applied ethics). Since the mid-1960s, the application of ethical theory to moral, social and political issues has been one of the major growth areas of philosophy. To some extent, of course, philosophers had always been concerned with normative issues except, perhaps, in the very heyday of ordinary language philosophy. On the whole, however, they did little more than sketch some implications or draw some provisional conclusions based upon distant familiarity with a few empirical facts. All this has now changed, as philosophers have come to immerse themselves in the subject-matter of the areas and issues of normative concern to them, whether these come from medicine and biotechnology or from business, law and the affairs of social and political life (see Business ethics). Not only do they apply their theories in the midst of a much broader and deeper understanding of the empirical settings within which these issues arise but their works have also changed in other respects. Real-life examples abound; normative claims that are a part of ordinary life are legion; and attempts to justify such claims, as well as to unravel the concepts in terms of which they are expressed, are common. Expressed in more or less nontechnical language, these works in the main address the educated and not merely the philosophical public, and they have had the effect of taking philosophy to some extent into the public arena.

One must distinguish here between philosophers approaching an empirical discipline and members of such disciplines approaching philosophy, a distinction usually marked in the case of medical ethics as that between philosophical and clinical medical ethicists. The latter find that their practices raise certain moral issues that need to be resolved in order for them to act, or to advise others about how to act, and to act in what they think can be shown to be a justified manner; they turn to philosophy to help them achieve these ends. The task of the former, however, even when they are ethical consultants in hospitals, remains what the philosopher’s task has always been: to test arguments for soundness. To this end, they deploy the tools and canons of logic on behalf of accuracy in argument; they explore questions of meaning, implication, presupposition, derivation, relation, compatibility; they pry into and generate examples and counter-examples, both realistic and hypothetical; and so on. One important tool they use is the analysis of those concepts employed in the arguments being tested; analysis is not, however, an alternative view of what philosophers should be about, in some way competing with their assessment of arguments. Thus, while philosophers can immerse themselves in the factual material pertaining to the arguments they are assessing, increases in this material and in the knowledge pertaining thereto are not their concern. Applied ethics at its best, when done by philosophers, does not involve the philosopher as an agent of empirical discovery - therefore, complaints based upon lack of expertise or professional qualifications in the relevant empirical disciplines do not automatically succeed - but as the agent of sound and, therefore, probed or tested argument.

3 Moral status and justification of treatment

To consider only the very broad usage of ‘bioethics’, it is easy to see how this picture of what the philosopher is about inserts itself into the moral discussion. In the case of environmental ethics, for example, issues to do with the value, integrity and treatment of the environment, including whole ecosystems, are of fundamental concern, and the theoretical stances within which these notions are addressed become important. To focus upon value, traditional ethical theorists, such as utilitarians and Kantians, embrace value theories that are typically human-centred; environmental concerns figure in them through their effect upon and implications for human interests (see Kantian ethics; Utilitarianism). Nor will it matter that an essentially human-centred value theory is extended to some animals, since such a theory typically favours humans (and animals) on the strength of criteria (such as sentience and desire-satisfaction) that exclude inanimate nature. Many environmentalists claim to want a nature-centred, truly ecological ethic, in which the environment, viewed either holistically, as a well-functioning biotic community, or as separate parts of such a community, parts with a good of their own, counts for something quite apart from its service to human (and animal) interests, purposes and goals.

Traditional ethical theories incorporate a distinction between instrumental and intrinsic value (see Values). Nature is viewed as instrumentally valuable, and some facet of persons (or, more narrowly, agents) is viewed as intrinsically valuable, valuable in its own right. To the extent that some animals share in these facets, to that extent

they can be viewed as intrinsically valuable. It seems clear, however, that little of inanimate nature can be so viewed. Numerous environmentalists want to break out from these person- or agent-centred value theories and to extend the notion of intrinsic value into nature. Talk of 'intrinsic value', of course, is ambiguous, so we might characterize the matter this way: what some environmentalists appear to claim is that an ecosystem or nature is valuable independently of any reference to human (or animal) interests, states of mind or desires. Unless we can extend this concept of independent value to nature, we have no real case for regarding rocks, forests and dirt as part of an expanded moral community, in circumstances in which only those things within that community enjoy the moral protections that, for example, affect how they are treated. Of course, someone might think that we are under some duty not to pollute rivers, and so hold rivers as a result to enjoy moral protection, but this duty would not obviously make rivers count for anything in their own right. So the case for a wider view of the moral community seems in large measure to depend upon our agreeing that there are independent values in nature. The philosopher enters this discussion easily; for if we sever talk of value from any connection with humans (and their conative and cognitive states), so that there could in essence be values without valuers, we need to go on to provide an account of the generation of the whole notion of value. For this severance from humans has deprived us of what the traditional theories have seen as the origin of value. Thus, the generation and source(s) of value become important issues, ones that fall within the domain of the philosopher (see Value, ontological status of).

The issue of who or what is a part of the moral community has been an important one in bioethics with regard to foetuses, those in permanently vegetative states, members of future generations, and inanimate nature and animals. A related issue has been the matter of justification of treatment. If, for example, (some) animals are not members of the moral community, then the case for medical and scientific experimentation upon them seems relatively easy to make; if they are members of the moral community, then why do they not enjoy the protections accorded human members? Can we treat different members of that community differently? Why, if a heart transplant is required to save a child, should we use the heart of a healthy baboon instead of the heart of, say, an anencephalic infant?

A further issue is of obvious importance here: can, for example, a person or an agent, who has been a member of the moral community, cease to be a member? If membership is determined by some specific characteristic, then loss of that characteristic could remove one from the moral community, and the whole issue of how those outside the moral community can be treated arises. It seems important, then, to be able to retain membership. But how is this to be achieved? The integrative personality that we associate with human persons can come apart, and those in the advanced stages of Alzheimer's disease, unless they can be included by means of the interests of others in having them protected, can fall at risk. Yet, if they are included within the moral community through others, do they continue to count for anything in their own right? They remain alive, but they have lost, arguably, that which ensured their inclusion within the moral community; their inclusion now seems to depend upon the contingent fact of whether other people's interests encompass them.

Much of contemporary bioethics, then, is concerned with these interlocking questions of moral standing, justification of treatment, and loss of moral considerability in one's own right. The human cases of the brain dead, anencephalic infants, and those in a permanently vegetative state seem cases in point. May one permissibly use the organs of these individuals? If so, then the case for xenotransplantation, or the transplanting of animal organs into humans, is surely affected, even if not perhaps extinguished (see Moral standing).

4 The problem of disagreement

As a part of applied ethics, bioethics in its broad usages is subject to a difficulty that seems fundamental. The standard conception of applied ethics is one of the application of principles to practice, and the various subject areas of bioethics appear to share in this conception. Thus, much of recent medical ethics appears to be the working out in practice of the implications of those moral principles that one takes to be relevant to the cases at hand, and environmental and animal ethics are usually portrayed in the same light. Now this standard conception of applied ethics is thought by some to leave out such things as personal relations and emotions, as integral parts of how we view cases morally, but others think that it can be made to include these things (see Morality and identity §4). What seems quite clear, however, is that there is a deeper difficulty with this standard conception.

The fact is that we do not agree in our moral principles and do not agree, moreover, if several of them seem to apply to a particular case, on the measures or principles by which we weigh and balance the contending principles in order to decide which predominate in that case (see Moral judgment). This much is clear to all parties to the

debate, who stress different moral principles applicable to the situation or different weights to those principles. Nor can we be said to be moving towards a consensus in principles: in the cases of abortion, euthanasia, physician-assisted suicide, and homosexuality, for example, there is widespread, deep disagreement both over the permissibility of such acts and over the moral principles which are supposed to make them permissible or impermissible.

Moreover, we do not agree in the moral theories in which our moral principles find a home and by which we try to justify them. Utilitarianism, Kantianism, contractualism, virtue theory and more remain at odds with each other as philosophical accounts of morality. Those, for example, who use a broadly consequentialist theory continue to find themselves at odds with Kantians and others.

Yet the difficulty runs deeper still. For we do not even agree upon the test(s) of adequacy of the moral theories in which moral principles find their home. Indeed, this whole issue of the earmarks of adequacy in ethical theory is hotly disputed today, and resolution of it is hostage to our inability to agree on a number of things. One is how appropriate the model of the physical sciences and its determination of theoretical adequacy is for ethics. Another is the meanings and logical properties of the moral concepts and whether, say, the terms 'right' and 'good' are identical with and to be understood exhaustively in terms of natural properties, empirical properties occurring in the natural world (see Naturalism in ethics). Still another is the role of our moral intuitions in the assessment of theoretical adequacy in ethics (see Intuitionism in ethics). As for this last, any direct reliance upon intuitions is rejected by many, whereas indirect reliance through some form of 'reflective equilibrium', whether narrowly or broadly construed, has also proved contentious (see Moral justification §2). Of course, the overwhelming temptation may well be to think that moral intuitions have probative force, because the model of science can seem virtually to compel us to regard them as the data of ethics. But why should we think that that model is appropriate to ethics in the first place?

To many, then, bioethics suffers from a complaint that infects applied ethics generally, a complaint the resolution of which awaits further work in ethical theory rather than in applied ethics itself. The problem is not that people disagree over the moral principles (or the weight of such principles) by which they set out and discuss cases; it is that there is no obvious way at the moment of resolving this disagreement at the level of ethical theory wherein we seek to justify our principles. The result is that much of bioethics, and applied ethics generally, takes the form of setting out cases in terms of different moral principles and theories, without providing us with any way of deciding between them. One can pick and choose among those items on offer, but all the interesting philosophical work lies outside the scope of any such view of bioethics and applied ethics. This is one of the reasons why some challenge the view that applied ethics is, as it were, a separate branch of ethics.

Bioethics, Jewish

Jewish bioethics seeks to apply Jewish modes of normative discourse in bioethics. For some moral issues in medicine, explicit guidance may be found in the traditional sources of halakhah*; but many others require creative application of ancient or medieval precedents and norms. Much of the contemporary writing in this area takes the classical form of rabbinic Responsa to specific queries from adherents of the* halakhah*. But the field also includes contributions from thinkers who offer not rulings on religious law but the fruits of moral inspiration by the tradition.*

In the Judaic tradition the idea that each human being is created in God's image fosters a powerful commitment to saving and prolonging life. Murder and suicide are terrible sacrileges. Procreation is highly valued. Contraception is not easily countenanced, and still less is abortion. But abortion is clearly distinguished from homicide.

The symbolic preciousness of the divine image disallows disfigurement of human corpses. The implications of this prohibition for pathology and for the study of anatomy are hotly disputed. The prohibition is overridden, however, in cases of immediate life-saving.

Regarding triage and resource allocation, the universal egalitarianism implied by the idea of God's image fosters a powerful reluctance against bringing about any person's death, even to save a number of lives. Some tension arises between this egalitarianism and traditional structures of social and religious hierarchy.

1 Problems of method

Jewish bioethics, like other areas of applied Jewish ethics, faces foundational problems of method and disciplinary presuppositions. These problems arise from the conjunction of reasoned ethical discourse with a tradition whose core teachings are deemed to be divinely revealed.

Jewish religious law (see Halakhah) is a central aspect of the Jewish normative tradition, but when Jewish bioethics focuses on this aspect, it can become a discourse of authority, taking the form of commandments and injunctions addressed to those bound by that law. Such teachings, it has been forcefully argued, cannot validly claim relevance to non-Jews or even to secular Jews.

Certain writers, however, find in *halakhic* discourse a more universal aspect, whose norms do not draw their authority from the particular commitments of the Jewish covenant. Some locate this aspect of *halakhah* in the seven 'Noahide Laws', which are seen to represent a sort of natural law. Others find the universal aspects in specific broadly humanistic themes. But in either case, the challenge of imbuing Jewish bioethics with general relevance consists in identifying the appropriate strands within *halakhah*. Since *halakhah* is not only a positive legal system but an articulated code of values, the significance of its teachings need not depend on accepting the legal system's authority *en bloc*. The fact is that *halakhic* discourse often appeals to reasons that are intelligible independently of religious authority. It can thus be seen as constituting a language of moral discourse that is widely accessible and relevant and that bears its own distinctive emphases and valuations.

2 Basic attitudes towards medicine

Because Judaism attaches great value to human life, not only is homicide viewed as sacrilege, but there is a positive duty to rescue any person from mortal danger: 'Anyone who saves a single life - it is as though he had saved an entire world' (Mishnah Sanhedrin 4: 5). Yet according to one strand of Jewish tradition, this duty, particularly in the context of medical practice, may conflict with an ideal of utter acceptance of God's providence. Thus the rabbis found it necessary to deduce from Scripture an explicit divine dispensation for medical intervention: 'a physician is granted permission to heal' (Berakhot 60a).

Several medieval thinkers, most prominently Nahmanides (himself also a physician), retained some uneasiness about human self-reliance and depicted medicine as compromising perfect piety. Maimonides, by contrast, emphasized the divine origin of our capacities for healing and treated medicine as a most valuable art and profession that can secure the years human beings need to attain spiritual fulfilment. Mainstream *halakhic* policy follows Maimonides in accepting medical interventions and regards a physician's duty to heal as but one instance

of the general religious obligations to forestall dangers and to relieve human suffering. This duty is antecedent to any contractual relation between doctor and patient and, needless to say, holds even where the patient is unable to pay the costs of medical services.

In *halakhah* the obligation to forestall even a small risk to human life takes precedence over all other injunctions save three: the prohibitions against bloodshed, idolatry and incest. In practice, this confers great authority upon physicians. For it is they who can proclaim a state of emergency concerning the endangerment of human life. This authority does not extend, however, to the formulation of normative judgments. Thus ‘Medical Halakhah’ could not in principle be a set of special norms adopted by physicians. Rather, it takes the form of guidance for medical practice, derived from the *halakhic* tradition (see Medical ethics).

3 At the deathbed

In the classic sixteenth-century code of Jewish law and ritual, Joseph Karo’s *Shulkhan ‘‘Arukh*, the sections on caring for the sick are followed by a special section on ‘laws pertaining to *gosses* [that is, a dying person]’ (Yoreh De’ah 339). The sacredness of human life is conveyed by a Talmudic metaphor: the life of a *gosses* is like a flickering candle - ‘anyone who touches him is a shedder of blood’. When a person reaches this final phase, the soul’s departure must be neither hindered nor hastened, even where a quicker release is requested by the dying person. *Halakhic* writers place this rule in the context of the prohibition on suicide (see Genesis 9: 5-6 as interpreted at *Genesis Rabbah* 34: 13). The underlying principle, once again, is the exalted value of the life of the human being, created in God’s image.

Contemporary writers commonly ground the prohibition of suicide in affirmations of God’s sovereignty over life and death. Arguing against secular assertions of human autonomy, they condemn active euthanasia even at the patient’s explicit behest. ‘Passive’ euthanasia is cautiously accepted - extending, on some views, even to the removal of artificial life-support. This acceptance applies, however, only to a patient in the phase of *gosses* - a term traditionally limited to patients who could not be expected to live more than three days. In the context of modern medical capabilities, the proper scope of the term seems uncertain, but it is clearly narrower than that of ‘terminal’. In practice, determination of the point beyond which efforts to prolong life should be foregone is commonly left to the patient (and patient’s family), especially where further treatment itself involves some risk of death.

Against the main contemporary trend of opposition to active euthanasia and assisted suicide, stands the rabbinic endorsement of King Saul’s act in falling on his sword to avoid capture and torture. This biblical precedent, alongside the self-sacrifice of martyrs, is cited as an express qualification to the original prohibition on suicide. The precise circumstances justifying Saul’s suicide are variously defined. Some commentators, at least, find them simply in the expectation of inescapable death accompanied by great suffering.

It has also been argued that, under Jewish law, killing a terminal patient is less severe than murder, since capital punishment - the normative penalty for murder - does not apply to one who kills a terminally ill individual. It is not clear what moral significance the distinction carries, however, since it is but one among a host of instances in which the rabbis renounce capital punishment. In all these instances, the rabbis’ hesitation is arguably directed at the punishment, rather than at the culpability of the act.

4 Triage

Grounding the value of human life in the belief that human beings are created in God’s image implies a basic equality regarding life itself, transcending cultural boundaries and social hierarchy. No (innocent) person may be killed in order to save the life of another. But does the same standard point towards an absolute prohibition of killing, even to save a great many persons? An early rabbinic text reads:

> If a group is told by heathens: ‘Hand over one of your number and we shall kill him; otherwise, we shall kill all of you!’ they should all be killed, rather than surrender one individual of Israel.
>
> (Tosefta Terumot 7: 20)

The emphasis on ‘one individual of Israel’ has prompted an interpretation in terms of group solidarity in the face of ‘heathen’ persecution. But a prevalent alternative reading sees here a more general principle which would

clearly preclude, say, killing one person in order to provide transplant organs for the saving of several lives. Rabbinic debates are recorded regarding some exceptions to the rule, for instance, where the said individual is sure to perish anyway.

When the choice involves not killing but deciding whom to save, there is broad agreement that the numbers should count. This quantitative angle appears to extend to triage as well: the ‘one bed’ or ‘one kidney’ should go to the patient who is expected to gain a full lifespan, not to one whose death will only be somewhat postponed. According to some writers, there is room also for traditional considerations of personal status or merit: one learned in Torah might be given precedence over an ignoramus, one of priestly descent (a *kohen*) over an ordinary Jew, a man over a woman, or a Jew over a Gentile. Other writers reject any such distinctions; some strongly advocating ‘first come, first served’ (see Nursing ethics).

5 Procreation and abortion

Rabbinic traditions regarding abortion are far from consistent. Two oft-quoted passages (Mishnah Niddah 3: 7 and Babylonian Talmud Yevamot 69b) refer to pregnancy up to forty days as ‘mere fluid’. Beyond this point, some mandate abortion for the sake of a moderate interest of the woman, arguing that the embryo is simply ‘her body’ (‘Arakhin 7a). Others denounce it as ‘bloodshed’ (Sanhedrin 57b). But all draw a sharp boundary between a foetus, even at full term, which must be killed to save the woman, and a newborn, who may not be harmed (Mishnah Ohalot 7.6).

Contemporary views reflect this early diversity, differing greatly about the gravity of the prohibition of abortion at various stages of a pregnancy. The issue is not exhausted here, however, since the tradition emphasizes a positive duty of procreation. This is illustrated by the fact that infertility (of either spouse) has traditionally served as sufficient grounds for divorce. Contraception is in general not easily countenanced, and abortion is commonly viewed as slighting the value inherent in each new human life, created in God’s image.

Yet *halakhic* rulings on the morality of either contraception or abortion reflect also the force of the reasons weighing against pregnancy. These may include concerns about birth defects, the woman’s health, food supplies (in times of famine), or even the pursuits of one or both of the prospective parents. The weight assigned to such factors in modern rabbinic opinions can reflect in turn the extent to which patriarchal attitudes are replaced by more egalitarian ethical concerns.

The view of procreation as an important mitzvah (divinely commanded obligation) entails a generally positive attitude towards medical interventions against infertility. Artificial insemination and in-vitro fertilization are widely condoned, as long as they use no ‘third party’ gametes. But donor insemination is condemned by several *halakhists* as ‘artificial adultery’. The view that a woman may be fertilized only by her husband’s sperm is not accepted by all, however. Some argue that adultery means only sexual infidelity.

6 The human body as resource

The obligation to preserve one’s own life leads to some debate regarding the risks assumed in donating an organ such as a kidney. But most *halakhic* discussion regarding medical use of human bodies focuses on the bodies of the dead. First, it is necessary to determine when a person may be considered dead. Traditional *halakhic* teachings focus on breathing, and some contemporary scholars still adhere to this criterion, rejecting any notion of ‘brain death’. This rules out transplantation of a heart, liver or other vital organ. To remove the heart of one who has not ceased to breathe is viewed as outright murder. Others, including the Chief Rabbinate of Israel, have adopted innovative interpretations that permit such transplantations. According to one argument, the traditional criterion of ceasing to breathe is met upon complete death of the brain stem, since that precludes *autonomous* breathing.

The *halakhic* requirement of respect for the dead and the concomitant prohibition against disfiguring the dead raise serious problems regarding the use of corpses. Most interpreters understand the normative concern not in terms of the interests of the deceased but as a matter of reverence for God’s image. The prohibition is outweighed, however, by the duty of saving life. Thus transplants of kidneys, corneas and the like, which do not depend on endorsing brain death, are widely condoned.

But less immediate medical uses, such as dissections for the study and teaching of anatomy or surgery,

post-mortem examinations, and research using cadaveric organs or tissues, are hotly contended. Do such pursuits come under the overarching concept of *life-saving*, a duty that overrides virtually any prohibition? Or should that rubric be confined to immediate emergencies? The view adopted by many *halakhists* opposes post-mortem pathological practices, and poses a serious obstacle to the study of medicine. Those who follow such teachings yet avail themselves of modern medicine have consequently been criticized as free riders.

Blackstone, William (1723-80)

Blackstone produced the first systematic exposition of English law as a body of principles. His enterprise was founded upon the assumption that the detailed rules of English law embodied and enforced natural law. Blackstone's invocation of natural law has frequently been regarded as ornamental rather than substantial, but there is no good reason for taking this view. Blackstone is now remembered as much for Bentham's attacks upon him as for his own contribution.

Sir William Blackstone was the first Vinerian Professor of English Law in the University of Oxford; he subsequently became a judge of the King's Bench, and then of Common Pleas. He is most famous for his four-volume *Commentaries on the Laws of England*, which was published between 1765 and 1769.

Among philosophers, Blackstone is probably principally remembered for the attacks mounted upon his work by Jeremy Bentham (§1). This greatly underestimates his true significance, however, for the *Commentaries* constituted the first systematic treatment of English law as a body of orderly rights and principles. English law-books prior to Blackstone were unsystematic in arrangement: they were huge compendia of legal information arranged alphabetically, or collections of writs and pleadings with associated commentary. Blackstone introduced into English legal writing a tradition of exposition and analysis which related more specific rules to general principles, the latter forming an integrated structure of rights. This was not simply a matter of giving well-organized expression to traditional legal ideas: in order to express the common law in systematic form it was necessary to reconceptualize it fundamentally, and this Blackstone did by relating his account to what he conceived to be the law's foundations in natural law (see Natural law).

Blackstone begins his masterwork (1765-9: vol. 1, section 2) by embarking upon a general discussion of natural law. Anyone seeking to present Blackstone as a serious contributor to natural law theory is bound to be discouraged by this opening discussion: the points are loosely structured and ambiguous, and are asserted rather than argued for; the game of spotting contradictions has proved easy, if unrewarding. The insubstantial nature of the discussion has led many to conclude that Blackstone's invocation of natural law serves purely ornamental purposes. It is certainly true that such discussions were conventional among institutional writers of the period. Yet what does such a convention signify? We have not explained the presence of the discussion simply by pointing to its conventional nature; and an explanation of the convention itself requires an understanding of the deep assumptions underpinning the emergence of systematic legal writing.

Why should it be assumed that laws will form an orderly system? In so far as law is a product of authority, identified by its source, laws might well be expected to form a haphazard list, incapable of reduction to any limited set of general principles. For Blackstone, the relevant grounding perspective was provided by the assumption that English law was concerned to enforce natural rights. It was this perspective which enabled him to abandon the traditional framework of legal thought, within which the common law was thought of as a body of remedies, and to systematize the law in terms of substantive rights. Even though English law might not reflect natural law with perfect accuracy, it was capable of systematic study to the extent that it did so reflect natural law. Thus he endeavours to expound English law in terms of a system of natural rights, and he draws on the writings of natural lawyers throughout the *Commentaries* (and not simply in the opening section).

The tendency of Blackstone's work (in common with that of other treatise writers) to expound the extant legal rules in terms of the moral values which (in his view) served to justify them formed the focus for Bentham's attack upon him. Bentham argued that Blackstone conflated the law as it *is* with the law as it *ought to be*. Intellectual clarity required, in Bentham's view, a clearer separation between the roles of *expositor* and *censor*.

Those who deny the substantial nature of Blackstone's reliance upon a theory of natural law are unduly influenced by the *ad hoc* and broadly utilitarian character of many of his arguments. This does not seem to correspond to the conventional image of a natural law theory. In fact it is very much in line with what we might expect from a natural law writer in the mid eighteenth century. The theories of Grotius and Pufendorf, which were influential in the preceding century, had separated the mode in which we ascertain the *content* of natural law (in considerations of the requirements of social life) from the basis of its obligatory force (in the divine will). This meant that, behind

the deontological façade provided by the notion of the divine will, natural law developed a somewhat utilitarian and empirical character which is clearly reflected in Blackstone's work.

It is also suggested that Blackstone's defence of Parliamentary sovereignty involves a commitment to the legal positivist belief that legal validity is a matter of source alone, and not of content (see Legal positivism §1). The error here lies in the assumption that natural law theories must deny the source-based view of legal validity: the point of such theories, however, is to emphasize the extent to which the content of law reflects the requirements of natural law, rather than to offer any particular account of the criteria of legal validity.

Finally, Blackstone's extensive use of history is sometimes thought to be inconsistent with a commitment to timeless principles of natural law. There is indeed a tension between Blackstone's deployment of history and his invocations of natural law. He seeks to address this problem only on a rhetorical plane: he claims that the rights conferred by natural law are, in other countries, so debased that they may now fairly be called 'the rights of the people of England'. This enables him to use the language of one ideology, within which rights are an inheritance of the English, while not abandoning natural law theory, within which such rights are universal.

Blair, Hugh (1718-1800)

Blair was the foremost literary critic and preacher of the Scottish Enlightenment. He participated in the thriving cultural life of eighteenth-century Edinburgh, and along with William Robertson, Adam Ferguson and other enlightened Moderate party clergymen was a close friend of that city's greatest philosopher, David Hume.

As minister of the High Kirk in St Giles Church, Edinburgh, from 1758 until his death, and Regius Professor of Rhetoric and Belles-Lettres at the University of Edinburgh from 1762 to 1784, Hugh Blair occupied Scotland's most prestigious platforms for literary and religious oratory. His phenomenally successful publications were direct outgrowths of his preaching and teaching. In 1807 the Critical Review declared Blair's *Sermons* (1777-1801) to be, excepting the Spectator, 'the most popular work in the English language'. His *Lectures on Rhetoric and Belles-Lettres* (1783), the first comprehensive guide to the rules of written and spoken English in the various branches of polite discourse, enjoyed comparable popularity in the literary world. One of his early academic lectures, revised and published in 1763 as *A Critical Dissertation on the Poems of Ossian*, did much to encourage the subsequent Ossianic vogue. These works by Blair were frequently reprinted and translated; along with his professorship and church living, they brought him international fame and considerable income.

Blair contributed to the philosophy of the Scottish Enlightenment (see Enlightenment, Scottish) in two major ways. First, his Lectures included influential discussions of the principles of literary taste and philosophical discourse. At their core is the idea that clarity, simplicity and perspicuity constitute the proper foundation of all forms of communication. In regard to philosophical writing specifically, Blair's thirty-seventh lecture states that 'beyond mere perspicuity, strict accuracy and precision are required in a Philosophical Writer', in addition to 'embellishment' attained through 'illustrations' and 'a polished, a neat, and elegant Style' that avoids 'too much ornament'. Plato and Cicero among the ancients, and John Locke among the moderns, are held up as the models of clear and elegant philosophical discourse, whereas Seneca and the Earl of Shaftesbury are censured for their excessively ornamental styles.

Second, Blair's *Sermons* popularized the ideal of Christian Stoicism, or the belief that happiness is to be found within - in resignation to the will of God - rather than in worldly matters. Blair repeatedly asserts 'that mind is superior to fortune; that what one feels within is of much greater importance than all that befalls him without'; that 'the happiness of every man depends more upon the state of his own mind, than … upon all external things put together', and that awareness of the nature of the human condition points out 'how submissive ought we to be to the disposal of Providence'. Such preaching represented a comforting, polite form of Presbyterianism, which complemented Stoic elements in the philosophy of other thinkers of the Scottish Enlightenment.

Blanchot, Maurice (1907-)

Maurice Blanchot, has since the 1940s been a dominant voice in French philosophy and letters, initiating a postmodern discourse which has had a profound impact on Bataille, Levinas, Foucault and Derrida. His early writings, between 1930 and 1940, consisted of cultural and political criticism. The experience of the Second World War led him to disengage from politics and he became an essayist and novelist. His works have included novels, narratives, and criticism, notably. Since the 1970s he has produced a series of fragmentary writings in which the line between literature and philosophy is shattered and, since the 1980s, meditations on language, death, the 'disaster' and community.

Basing himself on Mallarmé, Blanchot distinguishes two kinds of language, or speech. Crude speech is utilitarian, descriptive, and representational; it puts us in touch with the object-world. Essential speech is poetic, what Blanchot designates as the 'pure language' through which, as he asserts in *L'Éspace littéraire* (1955) (*The Space of Literature*, 1982) 'it is being that tends to speak and speech that wants to be'. Essential language can reveal what is normally concealed, something which still is when everything has disappeared: being. 'The essence of being is to be there still where it lacks, to be inasmuch as it is hidden' ([1955] 1982: 41, 253). As with Heidegger, this poetic language has ontological priority for Blanchot. For him, the poem, literature, is an act of transgression; it reaches beyond all limits. As he says in *L'Entretien infini* (1969) (*The Infinite Conversation*, 1993), following Bataille, 'Transgression designates what is radically out of reach: assailment of the inaccessible, a surpassing of what cannot be surpassed' ([1969] 1993: 453).

Writing as transgression, literature as an expression of essential speech, occurs under the spectre of human finitude, and so as a confrontation with death. This link between writing and death is particularly clear in the novel *Le Très-Haut* (1948) (*The Most High*, 1996), in the last line of which, the hero, Henri Sorge, at the very moment of his death, cries out: 'Now, now I'm speaking' ([1948] 1996: 254). Death is the primordial experience for Blanchot, and it is through their encounter with it that humans make themselves mortal. Hence, as he says in *The Space of Literature*: 'Death, in the human perspective, is not a given, it must be achieved' ([1955] 1982: 96). Blanchot distinguishes between two kinds of death: death as the disappearing of consciousness, the biological extinction which humans flee, the dying which does not permit us to complete our death; and death as consciousness of disappearing, the death which the poet wants to shape, and through which humans seek to achieve their mortality. It is because death as consciouness of disappearing is so elusive, indeed even self-contradictory, that Blanchot is driven beyond the limits of discursive language in his effort to grapple with it.

For Blanchot, modernity's quest for community is haunted by totalitarianism, and by what he designates as the disaster. While his image of totalitarianism as an omnipresent feature of the political topography of the twentieth century has been shaped by the experiences of Nazism and Stalinism, it is not exhausted by them. For Blanchot, the danger of totalitarianism is that all negativity or independent action will be appropriated by the state, all opposition recuperated, all criticism absorbed. His fear, expressed in *L'Écriture du désastre* (1980) (*The Writing of the Disaster*, 1986), is that the totalization of the state in modernity will lead to a world in which 'the prisoners construct their prison themselves' ([1980] 1986: 45). The disaster, as Blanchot conceives it, is encapsulated by the totalitarian state, with its camps, in which what takes place is 'dying, as forgetfulness of death' ([1980] 1986:17). So powerful is the presence of the Holocaust, and its death camps, that Blanchot designates it 'the *absolute* event of history' ([1980] 1986: 47).

Yet in the face of the disaster, Blanchot sees humankind's search for community. Community appears in two forms in Blanchot's thinking. In the 1930s, in his earliest writings, his views were shaped by the extreme right-wing *Action Française*, to which he was then linked. At that time 'community' meant an organic community, based on rootedness in a common place, a native soil, and ethnicity. The experience of Nazi barbarism and occupation led him to reject any conception of a traditional community, opening the way to his thematization of *l'autrui*, the other, as a basis of his thinking. Here, we can see the profound influence of his friend Emmanuel Levinas. As the antithesis of totality, and identity, as the embodiment of *l'autrui*, the Jew becomes the point of departure for a different vision of community. This Blanchotian vision, articulated in *La Communauté inavouable* (1983b) (*The Unavowable Community*, 1988) is an elective community based on friendship and open to alterity, in which the

other is no longer despised, and execrated; a community in which *l'autrui* is an irreducible element. In contrast to the traditional communities imposed on humans by virtue of blood or race, such an elective community would gather its members around a choice, 'that gave permission to everyone, without distinction of class, age, sex or culture, to mix with the first comer as if with an already loved being, precisely because he was the unknown-familiar' ([1983b] 1988: 30).

Blanchot's daring linkage of the dangers of the totalizing state, and the disaster which confronts humankind, as well as the need for a community in which *l'autrui* is at home, to the experience of the Holocaust, and its death camps, make his a seminal voice in postmodern thinking.

Blasius of Parma (d. 1416)

*Blasius of Parma was an important Italian philosopher, mathematician and astrologer who popularized the achievements of Oxford logic and Parisian physics in Italy. He questioned the Aristotelian foundations of medieval physical science, mechanics, astronomy and optics, thus helping to open the way to the mathematics, optics and statics of modern times. His teaching influenced the artists of the Florentine Renaissance in their rediscovery of linear perspective, and his discussion of proportions influenced the Paduan mathematicians up to the time of Galileo. He presented an atomist and quantitative account of physical reality, and a materialist account of the human intellect. His consequent denial of the immortality of the soul won him the title of 'diabolical doctor' (*doctor diabolicus*). His position on the human ability to avoid astrological determinism was equivocal. Though his work was scholastic in style, he enjoyed good relations with such Italian humanists as Vittorino da Feltre, whose request for lessons in mathematics he refused. In Florence, he took part in conversations between humanists and scholastics.*

1 Life

Blasius of Parma (Blasius de Pelacanis or Biagio Pelacani da Parma) was born on an uncertain date in Costamezana (Parma), but is known to have received his doctorate at Pavia in about 1374. He died in Parma and was buried there on 23 April 1416. He visited Paris during his youth, sometime before 1388, but spent most of his life in Italy. At various times he taught logic, natural and moral philosophy, medicine, mathematics, and astrology (which included natural philosophy or physics) at the Universities of Bologna, Padua, Pavia and Florence. He was forced to retire from the University of Padua in 1411 on the grounds that he had no students, and was no longer fit to teach. He wrote a large number of works, including commentaries on Aristotle's *On the Soul* (*Conclusiones de anima* in 1382; *Quaestiones de anima*, copying finished in 1385) and *Physics* (*Quaestiones physicorum*, two manuscript versions, 1382-8 and 1397), *Quaestiones de motuum proportionibus (Questions on the Proportions of Motions)* (two manuscript versions, 1389 and 1407) and *Quaestiones perspectivae (Questions on Perspective)* (two versions, before 1390 and 1403). Many of his works are available only in manuscript (for details, see Federici Vescovini 1979: 413-52). His writings show the strong influence of English and French authors, including William of Ockham, William Heytesbury, the Oxford Calculators, John Buridan and Albert of Saxony, as well as of Arabic science, astrology and optics.

2 Metaphysics

In the context of the fourteenth century, Blasius' metaphysics is strongly original, for he was a materialist. He worked out a doctrine of substance as prime matter, an indeterminate substratum common to all beings. This metaphysical conception of reality as prime matter resulted in its being conceived as ungenerable, incorruptible and eternal. The forms of particular beings originate from prime matter in so far as it is constituted internally by qualities which are dispositions to become this or that individual form, such as human being or horse. With the death of the individual, these forms disappear by returning to prime matter. Prime matter, however, is only a conjoint cause of the generation of forms. The other universal cause of generation is the universal movement of the heavens which, through the influence of their motion, activate the dispositions of prime matter, and bring individual forms to birth.

3 Human beings

A corollary of Blasius' metaphysical views and his desire to unify all observable phenomena is his inclusion of humans among those natural beings whose generation is accounted for in terms of prime matter, individual dispositions and heavenly influences. For Blasius, even the intellective soul of human beings is a naturally generated form, a material power which results from prime matter disposed to receive it by the movement of the stars. In this Blasius shows himself not a follower of Averroes (see Ibn Rushd §3), but rather of Alexander of Aphrodisias (§2). This materialist account was reinforced by Blasius' epistemology, which led him to argue that the existence of the intellect could be known only through inference from observation of the intellect's operations, and that such observable operations could not be independent of the body and matter in general. As a result Blasius denied the immortality of the human intellective soul. He was reprimanded by the Bishop of Pavia in 1396, but the reprimand was a mild one, without financial consequences or any effect on his teaching, which he pursued without

hindrance until his retirement. Nonetheless he showed greater caution in his later writings, and made reference to the priority of faith.

Blasius' materialist metaphysics raised obvious difficulties for human freedom, since the doctrine that humans can make free choices seems incompatible with astrological causality. Blasius resolved this problem of individual freedom by arguing that the human contains dispositions to act in one way or another, even when confronted with two objects which are equally attractive to reason, and that in providing these dispositions the stars incline but do not necessitate. As a result the individual is always confronted with freedom of choice (*libertas differentiae contradictionis*), though it is the impulse and not rationality that is impartial in the face of a decision. Blasius added in his later writings that the stars are only secondary instrumental causes. God is the true first cause, though his activity is only known through the activity of his instrument, the heavens.

4 Epistemology and science

Blasius adopted the English empiricism of William of Ockham (§§4-5) and his followers as filtered through the French teaching of John Buridan (§3) and Albert of Saxony. He thus held that we know only the singular, present individual (Peter, for example) whom we perceive in visual cognition (*intuitio*) by means of a repeated sensible experience. Through this sensible experience, a general image is formed in the memory, and this is the universal concept of some individual (Peter viewed as this man). Thus the difference between the intuitive cognition of the singular (Peter) and the abstractive cognition (the concept of the man Peter) does not depend on the thing cognized, which will always be a singular thing (*res*), but on the psychological and epistemological processes of our mind. Since Blasius is a materialist, he appeals to the doctrine of the agent sense (see John of Jandun and John Buridan) which plays a role analogous to the one the agent intellect was held to play in intellection. Blasius also assigned a role to species in perception, interpreting them as sensible impressions which are material signs of the external objects, while concepts are representational signs of the cause of the impressions. Blasius owed this doctrine of signs to Buridan and Albert of Saxony.

Given the centrality of visual experience in the elaboration of his empiricist epistemology, it is not surprising that Blasius devoted an important treatise, *Quaestiones perspectivae*, to the problems of optics, including the geometric laws of direct vision, reflection and refraction. The work consists of questions on the earlier work of John Pecham, and owes a great deal to the influence of the Arab Alhazen (see Ibn Hazm; Optics §1). He was critical of the perspectivists of the thirteenth century (the *antiqui*) in his discussion of the problem of the appearance of visual magnitudes which, he claimed, depended on distance and not only on the angle of vision. This view was important for the construction of the visual pyramid which, in connection with the geometrical approach to the perception of the distance of visual objects, was to generate the pictorial representation of perspective.

In accordance with his generally rationalist formulations, Blasius offered explanations of interesting superstitions of his time, as did Pietro Pomponazzi (§3) in his work *De incantationibus (On Incantations)* (1556). Blasius explained many phenomena held to be miraculous or diabolical as products of optical illusion, due to the laws of refraction. For instance he showed that some apparently miraculous apparitions in the sky of Busseto, near Milan, were phenomena brought about by the refraction of light on clouds during a thunderstorm.

His treatises on statics (*De ponderibus*) and on mathematical physics, *De motuum proportionibus (On the Proportions of Motions)* are also of great importance, for in them he established for the first time the concept of the quantitative measure of an extended physical substratum, understood as an atom (*quantum*) which is indivisible, limited and finite. These *quanta* could be both material and spiritual, for the human intellect can be regarded as an indivisible quantum. Blasius' atomism places him firmly in the anti-Aristotelian tradition. It is also important for the rise of mathematical physics through its emphasis on what is measurable and quantifiable as opposed to the Aristotelian doctrine of qualities. In this context he used the notion of latitude, or a range of degrees, which he took from Nicole Oresme (§2), to explain qualitative variations in a material subject, but he also followed the tradition of the Italian school of Simone di Castello, Giovanni da Casale and Jacopo da Napoli (see Clagett 1968: 66-107). He reduced the so-called intension of forms to extension and mathematical measure.

Blasius' logic is related to his science in that he applies terminist analysis, particularly with respect to supposition theory, to physical doctrines. He wrote a commentary on Peter of Spain which shows the influence of William Heytesbury and of Henry Hopton's treatise (formerly attributed to Heytesbury) on the significate of true

propositions, as well as of Albert of Saxony.

Through his scientific reflection on the world of nature and a philosophy freed of any subordination to theology, Blasius opened the way to a formulation of a mathematical method which would come to fruition in the modern science of Galileo Galilei (§2).

List of works

Blasius of Parma wrote a large number of works, many of which are available only in manuscript. Details of these can be found in Federici Vescovini 1979: 413-52 (see references and further reading).

Blasius of Parma (1382-5) commentaries on Aristotle's *On the Soul*, in G. Federici Vescovini (ed.) *Le Quaestiones de anima di Biagio Pelacani da Parma*, Florence: Olschki, 1974; Italian trans. by V. Sorge, Naples: Morano, 1994.(Editions of the manuscripts *Conclusiones de anima* (1382) and *Quaestiones de anima* (copying finished in 1385).)

Blasius of Parma (1386) *In quodam iudicio anno currente [13]86 (Prognostication of the Year 1386)*, in G. Federici Vescovini (ed.) *Rinascimento* 22 (1971): 90-3.

Blasius of Parma (before 1390-1403) *Quaestiones perspectivae libri tres (Three Books of Questions on Perspective)*, in G. Federici Vescovini and V. Sorge (eds) *Quaderni di 'Physis'*, Florence: Olschki, forthcoming; G. Federici Vescovini (ed.) 'Le questioni di "Perspectiva" di Biagio Pelacani da Parma', *Rinascimento* 12: 163-243.(Devoted to problems of optics, Blasius' *Quaestiones perspectivae* appeared in two versions, the first before 1390 and the second in 1403.)

Blasius of Parma (before 1416) *Tractatus de ponderibus (Treatise on Statics)*, in E.A. Moody and M. Clagett (eds) *The Medieval Science of Weights*, Madison and Milwaukee, WI, and London: University of Wisconsin Press, 1952, 238-78.

Blasius of Parma (before 1416) *Le Quaestiones dialecticae di Biagio Pelacani da Parma (Dialectical Questions by Blasius of Parma)*, ed. G. Federici Vescovini, J. Biard and V. Sorge, Florence, forthcoming.

Blasius of Parma (before 1416) *La 'quaestio de intensione et remissione formarum' di Biagio Pelacani da Parma (The 'Question of the Intension and Remission of Forms' by Blasius of Parma)*, ed. G. Federici Vescovini, *Physis: Rivista internazionale di storia della scienza* 31 (1994): 433-535.(Federici Vescovini gives an introduction and notes.)

Blasius of Parma (before 1416) 'Questioni inediti di ottica' (Unpublished Questions on Optics), in F. Alessio (ed.) *Rivista critica di storia della filosofia* 16 (1961): 79-110, 188-221.

Bloch, Ernst Simon (1885-1977)

Bloch was one of the most innovative Marxist philosophers of the twentieth century. His metaphysical and ontological concerns, combined with a self-conscious utopianism, distanced him from much mainstream Marxist thought. He was sympathetic to the classical philosophical search for fundamental categories, but distinguished earlier static, fixed and closed systems from his own open system, in which he characterized the universe as a changing and unfinished process. Furthermore, his distinctive materialism entailed the rejection of a radical separation of the human and the natural, unlike much twentieth-century Western Marxism. His validation of utopianism was grounded in a distinctive epistemology centred on the processes whereby 'new' material emerges in consciousness. The resulting social theory was sensitive to the many and varied ways in which the utopian impulse emerges, as, for example, in its analysis of the utopian dimension in religion.

1 Life and works

Ernst Simon Bloch was born in Ludwigshafen, Germany. He studied at the Universities of Munich and Würzburg, and had associations with Simmel's private colloquium in Berlin and Weber's circle in Heidelberg. For much of his adult life he lived as a freelance writer and critic. Like many left-wing Jewish intellectuals he left Germany on Hitler's accession to power in 1933, and eventually moved to the USA. In 1948 he received his first university post, as Professor of Philosophy at Leipzig, East Germany. Although initially sympathetic to East German regime, he eventually came into conflict with it, and in 1961 did not return from a visit to West Germany. Subsequently he became Professor of Philosophy in Tübingen, where he died. His most notable works are *Geist der Utopie (Spirit of Utopia)* (1918) and *Das Prinzip Hoffnung (The Principle of Hope)* (1954-9).

2 Metaphysics and ontology

Throughout his working life, Bloch attempted to refurbish the ancient category of 'matter' to provide a dynamic materialist theory of the universe (see Materialism). Matter, the substance of the universe, is not inert, but rather, in nature and humanity, capable of movement and development. In this respect Bloch distances himself from much twentieth-century Western Marxism, which seeks to prioritize the social over the natural (see Marxism, Western §§2-3). He credits the 'Aristotelian Left' (notably Avicenna and Averroes) with the earliest formulation of this radical materialism (see Averroism). The universe is open-ended and rich with 'possibility', allowing development, novelty, intervention and alternative outcomes to occur. From a human perspective, this open-endedness is both an opportunity and a constraint, for the possibility of choice is beset by the hazards of uncertainty; human life is therefore experimental. Bloch attempts to resolve the Marxist conundrum of the relationship between freedom and necessity. He is at pains to avoid ultra-subjectivity or hyper-voluntarism: possibility can take the form of the nonsensical and the impractical, but rational movement will take the form of the 'objectively-real possible' - the possibility grounded in existing social tendencies. Aspiration is thus combined with a non-positivist empiricism, which he terms 'process empiricism'. It is thus to be distinguished from a determinist teleology, which, following the analogy of the acorn and the oak, envisages humanity in terms of a fixed, inevitable future growing out of iron historical trends.

A fundamental way in which Bloch conceptualizes the dynamic tension at work within matter is by building up composite concepts around the category of 'not'. 'Not' is meant to register the absent and unfinished dimensions of reality, as in his logical proposition that 'S is not yet P'. In the human world the 'not' is present in the form of need. Absence, initially of food, drives the individual on to more and more sophisticated forms of interaction with nature and society. Humans are thus 'not-yet'; the completion of their being lies in the future, they constantly hunger for themselves. 'Not' is the negative aspect of the historical process, 'Hope' is the positive. 'Subjective' hope is to be distinguished from 'objective'; the former involves the perpetual and ubiquitous representation of that which is deemed to be absent. Bloch's massive *Das Prinzip Hoffnung* (1954-9) contains an encyclopedic account of the many manifestations of hope in human history, from simple daydreams to complex visions of perfection. Objective hope is the concrete possibility present in each successive age, which enables subjective hope actively to develop the world (see Hope).

3 Epistemology

Bloch conceives of consciousness as a narrow field or band. Beyond the lower boundary lies the 'no-longer-conscious', the realm of the forgotten and the repressed, explored by Freud. The upper boundary delimits the 'not-yet-conscious', the place where new material enters consciousness, 'the psychological birthplace of the New'. It is the unexplored territory that Bloch sought to map, and which makes up his central epistemological category. The production of new material occurs through the stages of incubation, inspiration and explication. Incubation is the period of active fermentation of the new, much of it below the surface of consciousness, to a point where it bursts into the conscious world. This is the moment of inspiration, a sudden lucid moment of illumination. Bloch is keen to anchor the epistemological in the social. The newness, which he terms the 'Novum', emerges with the confluence of subjective and objective conditions. The historical timetable generates the material which is incubated in the individual, and the inspiration is as much historical as individual. A Marxist sense of history informs this interpretation; progressive classes are the fundamental fact in the emergence of the Novum. The initial entry, however, occurs through immensely gifted individuals, such as Marx. The realization of newness requires the third stage in the process - explication. This is the immensely difficult task of adequately representing the new, such that it re-enters the historical timetable as immanent potentiality. It also involves overcoming the resistances of the existing world to novelty. Bloch calls the site at which present and future meet the 'Front'. Like the military use of this word, it is meant to suggest an advancing, although not necessarily straight, line into as yet unconquered territory.

4 Utopianism

Nowhere is Bloch more untypically Marxist than in his self-conscious utopianism. He distinguishes 'abstract utopia' from 'concrete utopia'. The former manifests the utopian function in its weakest form; it is mere dreaming, unanchored in the real tendencies of the age. Concrete utopia, in contrast, is rooted in objective possibility; it is grounded in the ascending forces of the age, and is the most pregnant form of the utopian function (see Utopianism). Bloch's unorthodox Marxism is also apparent in his attempt to harness aspects of religion to his revolutionary project. In *Atheismus im Christentum* (*Atheism in Christianity*), he argues that religious consciousness has been a potent vehicle for utopian longings and asserts the paradoxical claim that 'only an atheist can be a good Christian; only a Christian can be a good atheist' ([1968] 1972: 9) (see Atheism). He is sensitive to the temporal aspects of the utopian impulse, and maintains that individuals may be contemporaries in a physical sense but not necessarily in terms of forms of consciousness - 'not all people exist in the same Now'. In the 1930s he deployed the term 'non-contemporaneity' to designate this experience, and cited the peasantry as an example. Marxism had been blind to the subversive and utopian elements in non-contemporaneity, and had left these strata to be co-opted and distorted by fascism.

Also out of joint with much twentieth-century Marxism is Bloch's radical materialist concept of a 'natural subject'. Given that matter is active and dynamic, and that developed consciousness has emerged out of it in the shape of humanity, is it not possible to conceive of further creative development in the realm of nature? Furthermore, since the human cannot be radically separated from the natural, Bloch conceives of a creative interaction of the two in the future. Nature too has its 'not-yet'. The complexity of such a universe, Bloch argues, requires the abandonment of classical conceptions of time and space. He is attracted to the non-Euclidian conception of space developed by Riemann, in which space is altered by local variables. He proposes, by analogy, 'a kind of "Riemannian" time' which is neither universal nor unilinear, but rather contains a plurality of differing time scales. Only in a future, interactive reconciliation between humanity and nature might convergences of time occur.

Bloch's work tends to be known about rather than known. His writing is forbidding: structural complexity and formal eclecticism are combined with a style studded with opaque metaphor, untranslatable puns, obscure neologisms and overblown rhetoric. Furthermore, the political cast of much of the work is a deeply unattractive, unreconstructed Marxism-Leninism. Apart from his youthful dialogue with the young Lukács, he has had little influence on other major figures in twentieth-century Marxism, and none at all on the pre-eminent philosophical currents of the century. There is, however, growing interest in his work. Radical theologians have long valued his insightful analyses of the utopian dimension in religion; literary theorists are increasingly using his work in their studies of utopias and science fiction; whilst social and political theorists have found his utopian socialism deeply stimulating.

VINCENT GEOGHEGAN

List of works

Bloch, E. (1918) *Geist der Utopie (Spirit of Utopia)*, Frankfurt: Suhrkamp Verlag, 1971.(Bloch's first important published work combines messianic utopianism with wide-ranging cultural criticism.)

Bloch, E. (1935) *Erbschaft dieser Zeit*, Frankfurt: Suhrkamp Verlag, 1962; trans. N. Plaice and S. Plaice, *Heritage of Our Times*, Oxford: Polity Press, 1971.(Contains a highly distinctive analysis of national socialism, focusing on the dreams and fantasies of Weimar Germany.)

Bobbio, Norberto (1909-)

The foremost legal and political theorist in Italy today, Norberto Bobbio founded in the 1940s Italian analytical legal positivism, trying to merge logical positivism and Kelsen's legal positivism. As a political thinker, he defends a synthesis of liberalism and socialism, focusing in particular on the defence of human and civil rights in democratic societies.

Norberto Bobbio taught Jurisprudence and Political Philosophy at the universities of Camerino, Siena, Padua and Turin for over forty years. After the Second World War, he founded the school of Italian analytical legal positivism. Bobbio took part in the Resistance. After the Liberation he withdrew from direct political involvement, still, however, taking an active part in Italian political debate. He defends a tolerant, secular point of view and a synthesis of liberalism and socialism. In 1984 he was made a Life Member of the Italian Senate.

Bobbio's original outlook was largely formed by Croce's historicism in philosophy, and Gobetti's radical liberalism in politics (see Croce, B.). Yet, while Bobbio's political thought has always been inspired by Gobetti's project of reconciling social justice with individual civil and political liberty, Crocean idealism he soon rejected. He examined the phenomenology of Husserl and Scheler as well as the existentialism of Heidegger and Jaspers. In the mid 1940s he finally abandoned these philosophies to embrace a very different approach, influenced by logical positivism, which he saw as simultaneously rigorous, rationalistic, empirical, and ethically and politically committed (see Vienna Circle §2) - and for these reasons suitable to his own epistemological preferences, which have always been against the trends of what he has called the 'Italian ideology', that is congenitally speculative and idealistic in bias.

These developments culminated in Bobbio's founding of Italian analytical legal positivism. It is worth emphasizing what kind of legal positivism it was, because Italian analytical legal positivism has been an eclectic but fruitful attempt to graft a philosophical outlook - logical positivism - on to the legal positivism of Hans Kelsen's *Pure Theory of Law* (see Kelsen, H.; Logical positivism §2).

The first phase of Bobbio's theory of law (1949-65) was marked by his acceptance of Kelsen's interpretation of legal theory as a scientific, value-free form of legal study not concerned with the moral or political evaluation of law, nor with the sociological description of legal phenomena, but with the analysis of fundamental legal concepts and with the structure and logical interrelation of the elements of a legal system. As a consequence, Bobbio's main concern was to clarify fundamental legal notions such as 'legal rule' and 'legal system' as well as to give an account of the structure of legal orders.

Bobbio defended a version of normativism (the opinion that law is made up of rules), but answered many of the criticisms raised against this approach by elaborating a theory of legal systems, which successfully addressed many problems that could not be solved analysing single legal rules. So, in his *Teoria dell'ordinamento giuridico (A Theory of Legal System)* (1958), Bobbio contended that the definition of law, as well as the distinction of law from other normative phenomena such as morals and customs, is possible only if the legal system is taken into consideration. There are no special features belonging to all legal rules and only to legal rules. In fact, it is the legal system as a whole that has identifying features such as effectiveness or coerciveness. A rule is legal because it belongs to a legal system; a system is legal because of the specific characteristics it has as a system (see Norms, legal).

This account of legal systems allowed Bobbio to acknowledge the existence of different types of legal rules. He refused Kelsen's reduction of all legal norms to duty- or sanction-imposing rules, taking into consideration the wide class of second-level rules (meta-rules), such as power-conferring rules, constitutive rules and so on. The classification of different kinds of legal rules and the description of their interrelationship within legal systems has been one of Bobbio's main contributions to legal theory.

Towards the mid 1960s, Bobbio came to a turning point in his interpretation of legal theory. It became clear that the two basic neo-positivistic philosophical assumptions at the root of Bobbio's outlook, namely the theory of discourse levels and the distinction between 'is' and 'ought' statements, were not consistent with Kelsen's interpretation of legal theory as a scientific endeavour. First, Bobbio distinguished between legal theory

(jurisprudence) and the discussion of the method of legal theory (meta-jurisprudence). Second, he criticized Kelsen's meta-jurisprudence as prescriptive - thus not scientific at all, as it did not aim at describing what jurists actually do but at prescribing what they should do. Third, Bobbio argued that Kelsen's doctrine of the basic norm, which gives unity and validity to a legal order, must rely on an ideological rather than a logical ground and so cannot be the basis for a value-free science of law.

In this second phase (from 1965 onwards) Bobbio thus acknowledged the prescriptive nature of the legal positivist's approach to law. Such an approach is not based on the desire to elaborate a scientific, value-free legal theory. Rather, the idea of a scientific description of the law is maintained by legal positivists because such an idea is logically required by the very notion of applying the law, which is central to the working of legal and political institutions based on the rule of law. Thus, the legal positivists' argument in favour of an objective description of the law simply shows their choice of the values of the rule of law (see Legal positivism §2).

Since the 1970s, Bobbio has on the one hand developed a sociological theory aimed at describing the social functions of law; on the other hand he has increasingly devoted his studies to political theory. In his functional analysis of law, Bobbio has focused on the 'promotional' function played by legal orders of developed countries, by stimulating desirable behaviour, mainly in economic and business activity, through positive sanctions such as subsidies, tax exemptions and so on. This function is one of the characteristic features of the welfare state, defended by Bobbio, as opposed to the liberal minimal state.

In fact, Bobbio's liberalism is basically a doctrine of constitutional guarantees for individual freedom and civil rights, not an economic theory of the free market. Bobbio sees no contradiction between liberalism and democracy. The basic rights - freedom of opinion, speech, association, and so on - on which the liberal state has been founded since its inception are the premises of the democratic state: if liberalism provides those liberties necessary for the proper exercise of democratic power, democracy guarantees the existence and persistence of fundamental liberties.

Bobbio's main concern in political theory has always been that of reconciling this understanding of liberal democracy with the demands of socialists for greater equality. He suggests that socialists must rethink their goals of social equality in ways compatible with the institutional framework of liberal democracies. Representative democracy has to be seen as a set of rules that cannot be given up if the risk of despotic regimes is to be avoided. Social rights, as the extension of civil and political rights, will be granted through the extension of representative democracy to the level of social life - to bureaucracies, to health and educational authorities, to the workplace and so on.

Bobbio has consistently played a part in active political debate in many fields: politics and culture, the defence of human and civil rights, the problem of peace in the nuclear age. A major contribution to political theory has been to show the strict link between human rights, peace and democracy.

Bodily sensations

Bodily sensations are those feelings, or sensory experiences, most intimately associated with one's body: aches, tickles; feelings of pain and pleasure, of warmth, of fatigue. Many philosophers contrast bodily sensations with perceptions of the external world, claiming that sensations provide one with awareness of nothing independent of them. An alternative approach is to take sensations to be a form of awareness of one's body - on one view sensations are simply the perception of the state and properties of one's body. Bodily sensations have been seen as a major problem for any attempt to give an account of the mind that takes it to be part of the material world as investigated by the physical sciences.

1 Bodily sensations and the body

The most intimate causes of bodily sensation are changes or states within one's body: dental decay leads to toothache; general exhaustion to a feeling of fatigue. Bodily sensations are distinctive in acting as signs for the bodily changes that cause them. Pains are signs of damage to or disorder in one's body; an agent will react to feelings of warmth or cold in a way appropriate to the change in temperature of their body; feelings of hunger or satiation will control someone's feeding. Yet sensations are not invariably correlated with their typical bodily causes: someone can feel hunger when they are satiated; pains in parts of the body that are not damaged. This is most commonly the case with referred pain, where damage to one part of the body leads to feelings of pain in some other part.

One typically feels bodily sensations to have locations within one's body. One may feel a pain in one's ankle or a ticklish sensation behind one's knee. Sensations can also fill or suffuse body parts, such as a burning sensation throughout one's upper arm, or a feeling of being bloated in one's abdomen. Location in the body may be more or less determinate - a pin prick may be felt at a particular point on one's finger, while an erotic sensation may lack a precise location. Some sensations are associated with the body without having a location, such as feelings of fatigue or depression. Even sensations which normally have a location may sometimes lack one: certain patients who have lost general feeling in a limb can be brought to have 'deep pain' without knowledge of where it is.

With some sensations we can draw a distinction between the sensation and what it is a sensation of. One's body may actually be warm when one does not feel it to be so - while one's body may feel cold even when it is not, as when one has a fever. The same is true of hunger, satiation and exhaustion. For other sensations there is no such separation between a feeling and what is felt. It may seem obvious that there cannot be a pain without a feeling of pain, and that there is no such thing as false pain, the feeling of pain without actually being in pain. In the former kind of case, we talk of sensations of warmth, but not warm sensations; the term 'sensation' is used to pick out the state of feeling rather than any object of that feeling. In the latter kind of case, we use the term 'sensation' not only for the feeling, as in the phrase 'a sensation of pain', but also for the object of that feeling, as when we say that pain is a sensation.

However, some philosophers think that even in the latter case, a feeling and its object are distinct. It has been claimed that one can have pains without feelings of pain, since there can be unconscious pains, as when one only gradually comes to notice a pain in one's thumb. And conversely, it has been claimed that one can have feelings of pain without the accompanying pain: someone in a confused state might come to mistake a feeling of intense cold for a sharp pain. Neither example offers a conclusive counterexample. At best, they demonstrate the gap between having a feeling and making a judgment about it. In the former example, unless it is supposed that one can be conscious only of what one notices, all that has been described is someone who does not notice the pain in their thumb; this is not pain without consciousness, only pain without attention to it. The latter example can be interpreted as one in which someone mistakes a feeling of extreme cold for a feeling of pain. This may challenge a claim about the epistemology of sensations - that one has incorrigible knowledge of them - but not the link between feeling and its object.

2 Sensations as subjective

The close link between feeling and its object lends itself to one account of the nature of bodily sensation, which may be labelled 'subjectivist'. On this view, sensations are to be contrasted with sensory states such as

perceptions, or intentional states such as beliefs that can take external objects, as in beliefs about the sun. One can have a perception of an object that exists whether one perceives it or not - the table I see will still be there when I turn my back. I can also have a sensory experience when there is no appropriate object for me to perceive: I may hallucinate a table. By contrast, bodily sensations may be claimed to be purely subjective states of mind, which are directed on no object at all, or none that is external or independent of them. This view of sensation may, but need not, be associated with a more general account of sense perception, on which all perception of the world involves the subject's having a purely subjective state, a sensation (see Perception). On such a view of perception, bodily sensations will just be one special case of sensation in general. The view does not so obviously apply to bodily sensations such as feelings of warmth or fatigue where what is felt does have a nature independent of the feeling. But for these, subjectivists may appeal to a distinction between felt warmth or fatigue, which will be taken to be a subjective quality, and the objective qualities of heat or exhaustion associated with those felt qualities. In support of this, they may point out how it is imaginable that different objective qualities could have been typically responsible for feelings with those felt qualities - for example, that the feeling of warmth could have been typically brought about by tickling the skin.

Subjectivism can take different forms. One approach, often labelled 'the act - object' view of sensation, retains the idea that there is a genuine object of awareness in having bodily sensations, even if that object depends for its existence on the subject's awareness of it. Others repudiate the idea that there are any such objects of awareness and insist that to feel a pain is to be in pain, denying that there is any distinction to be made between the feeling of pain and the pain felt. For one may be suspicious of the idea that genuine objects could be dependent on our awareness of them, and doubtful that such things could have a location in the world. In place of a feeling of pain and a pain felt, this 'no-object' view talks of feeling in a painful manner, or being in a painful state. This is rather like insisting that there are not such things as individual dances: when we say that Mary danced a polka, we do not mean that there was a certain thing, a polka, which she danced, but rather that she danced in a certain manner. So, too, one may insist that to say that Mary felt a pain is not to talk of some thing of which she was aware, but to talk of the manner in which she felt, or to talk of the character of her feeling (see Mental states, adverbial theory of).

Much of our ordinary talk about sensations, in particular the way in which we can locate them in the body, is resistant to these ways of eliminating the objects of awareness. If states of feeling are to be located anywhere, it is plausible to locate them only in the brain and central nervous system, but one can feel a pain in one's ankle, or a crick in one's neck. Since it is not the feeling that is located in one's ankle, the 'no-object' view must deny that we speak literally when we say that the ankle hurts. What then does it mean to talk of a pain in one's ankle? One answer would be to suppose that there are certain non-spatial qualities of one's sensations which one associates with spatial vocabulary. This idea is not particularly plausible: for there seems to be no prior limit to the exact positions on or in one's body where one could feel a sensation to be located; and one can feel a sensation to be located in a place where one has never had a sensation before. In addition, the felt location of a sensation has a different status to the non-spatial qualities of a sensation. Take any feeling in your left hand that you like - an itch, a tingle or whatever - and now imagine a qualitatively identical sensation in your right hand. You need imagine no difference in the character of the sensation other than its location in one hand rather than the other. The felt location of sensation seems to play a similar role to spatiotemporal location for physical things: qualitatively identical but distinct objects can exist at the same time if they are in different locations; qualitatively identical but distinct sensations can be had at the same time if they are felt to be in different parts of one's body.

An alternative is to suppose that the attributed location of a sensation does not report any quality of the sensation at all. Perhaps talk of location reflects the subject's dispositions to act towards or talk about the location to which the sensation is referred. Someone who feels pain in an ankle may be inclined to rub that ankle, or say that that is the part of them which hurts - on this view, what it is for one to feel a pain to be located in one's ankle rather than anywhere else just is for one to be disposed to rub that ankle or say that that is where the pain is. But are there really any such definitional connections between felt location of pains and dispositions to behaviour? Someone who is paralysed will have no disposition to rub their ankle; and someone might be unbothered by pain and not inclined to answer any questions about whether they have a pain. Furthermore, we can explain why someone feels concerned about their ankle by reference to the fact that they feel pain and the pain they feel is in their ankle - both the quality and the location of sensation explain the subject's attitude. So it is implausible that we could simply explain away the location of sensations in terms of the non-linguistic and linguistic behaviour for which they give

reasons.

3 Awareness of one's body and sensations as perceptions

If we have to take seriously the felt location of sensations, then we also have to take seriously things being felt at those locations, and the elimination of an act - object approach to bodily sensations will consequently seem unattractive. This need not, however, mean a return to the idea of pains and itches as inner objects of mind. One may instead claim that in having a sensation one comes to be aware of one's body. When I feel a pain in my ankle, what I feel is that my ankle hurts in some way: the felt location of sensation is the body part that one is aware of in having the sensation. When we count pains, we count the number of parts of the body which hurt. One's ankles, toes or teeth are no less part of the objective world than are tables and chairs, so bodily sensations cannot be purely subjective states of mind which give one awareness of nothing independent of them. Rather, having sensations gives one an awareness of an item in the objective world: one's body.

What is it to say that sensations give one an awareness of one's body? Some philosophers have claimed that sensations are just a form of perception of one's body. This view is difficult to defend. For other kinds of perception, there is a contrast between the qualities perceived and the perceiving of them. A book may be square without looking square; and it may look square without actually being so. One can also have visual or tactual hallucinations, as when Macbeth 'sees' a dagger; or a disturbed individual may feel insects on their arm when nothing is there. It is more difficult to establish this separation in the case of sensations. Phantom-limb sensations are the best candidates for the example of bodily illusions or hallucinations, since the amputee feels hurt in a body part which no longer exists. But one cannot take feeling pain simply to be the perception or apparent perception of damage or disorder to one's body: a body part does not have to be damaged in order to hurt. Referred pain is not a form of illusion: we do not suppose that the pain is somehow illusory, and lose concern for the part of our anatomy which hurts; rather we distinguish between where we feel pain and the cause of that pain. Nor do we suppose that a damaged but anaesthetized limb is really hurting - hurt has to go with the feeling of hurt.

Second, even if some aspects of sensation can be treated as perceptual, there are other aspects of what our sensations are like which are not plausibly ascribed to any aspect of the state of our bodies: when I feel a nagging toothache, or a burning sensation, there does not seem to be any objective feature of my tooth or my arm of which I am aware in having that sensation. In both cases the characteristic seems to belong to my state of awareness and not my body as an object of awareness. Of course the fact that I have a burning sensation may tell a medic much about the state of my body, but that is not to say that I am aware of the change in state of my body through having the sensation.

The implausibility of a purely perceptual model of bodily sensation need not lead us to reject entirely the idea that sensation is a form of primitive awareness of one's body that gives one an intimate link to it and through which one knows it and has feelings about it in a way that one has for no other object in the world. Supposing that sensation is a form of awareness of one's body fits very well the physiological and psychological links between sensation and kinaesthesia and proprioception - the sense we all ordinarily have of the movement and position of our limbs. It also fits another feature of sensations: that, primarily, we feel the location of sensations to be locations within the body, and not within other parts of space. This is true even for persons having a phantom-limb pain - they do not feel the pain to be located out in empty space, but feel it to be in an apparent limb which extends beyond the point of amputation.

Bodin, Jean (1529/30-96)

Jean Bodin was one of the great universal scholars of the later Renaissance. Despite political distractions, he made major contributions to historiography and the philosophy of history, economic theory, public law and comparative public policy, the sociology of institutions, as well as to religious philosophy, comparative religion and natural philosophy. Among his most celebrated achievements are his theory of sovereignty, which introduced a new dimension to the study of public law, and his Neoplatonist religion, which opened new perspectives on universalism and religious toleration.

Many of these intellectual positions, moreover, were responses, at least in part, to great political issues of the time. Against doctrines of popular sovereignty and the right of resistance put forward in the course of the religious wars, Bodin sought to show that the king of France was absolute. Against the widespread corruption and laxity that weakened and undermined the monarchy, he argued for administrative reform. And against the party that pressed the king to impose religious uniformity, he cautiously supported religious toleration. In all these respects Bodin's thought helped to inform the policies of the early Bourbon dynasty esatblished by Henry IV.

1 Life

Bodin was born in Angers, France, into a modestly successful middle-class family. Obtaining an excellent humanist education in his youth, he was to become in the course of his career one of the most outstanding humanist scholars of his age. His erudition was formidable in scope as well as depth, and his many publications include important contributions to almost every field of learning pursued by his contemporaries.

Bodin's professional training was in law which he studied at the University of Toulouse during the 1550s. Unable to secure a regular faculty position, he embarked on a public career as a barrister in the *Parlement* of Paris. However, at no point in his career did he retreat from the encyclopedic programme of research and writing that he had projected in his early years. The success of his earlier publications on history (1566), public finance (1568), and public law and policy (1576) gave him access as adviser and confidant to high political circles in and around the royal court. In the 1570s he was often a dinner companion of Henry III, and he became counsellor to Henry's ambitious younger brother, the Duke d'Alençon. But in 1576, as a deputy to the Estates General of Blois, Bodin took a public-spirited if impolitic stand against requests for new taxation. He was thus at odds with Henry's policy and no longer enjoyed royal favour. The death of d'Alençon in 1584, marked the end of Bodin's involvement in high politics. He moved from Paris to Laon where he was a royal magistrate from 1587 until his death in 1596.

These last years were a time of trouble for Bodin. The French Religious Wars, which had gone on intermittently since 1562, were now entering a climactic phase. With the assassination of Henry III in 1589, a savage struggle had broken out over the claims to succession of the Protestant Henry of Navarre (King Henry IV). Large parts of France, including Laon, came under the control of the militantly revolutionary Catholic League, whose programme and doctrine contradicted Bodin's long-standing principles of legitimacy, non-resistance and religious tolerance. Yet Bodin, like many other royalist magistrates of the time, openly collaborated with the League. He sought to justify his course by mystical reflections on the preordained doom of the ruling dynasty. But he seems to have been driven by fears not only for his office and his property, but perhaps for his life as well; now, as in the past, he was under suspicion of heresy. He stood publicly for Navarre only in 1594 when the forces of the latter were victorious.

These troubles notwithstanding, Bodin never ceased to pursue his vast programme of scholarly and philosophic research. Between 1588 and his death he produced two short works on ethics, a major treatise on religion and a system of natural philosophy. His writings make it clear that Bodin's religion was a Judaizing Neoplatonism. But outwardly at least he remained within the church, and on his death he was buried as a Catholic in accordance with his will.

2 Public law - the theory of sovereignty

Bodin's most celebrated work is his *Les six livres de la république (The Six Books of a Commonwealth)* (1576), an encyclopedic treatise of public law and policy that appeared in 1576. The theory of sovereignty, which provides its framework, was a major event in the development of European political thought. Bodin's precise definition of

supreme authority, his determination of its scope and his analysis of the functions it logically entailed helped to turn public law into a scientific discipline. With Bodin and his followers (especially in Germany), the various jurisdictions of a state could be systematically ordered with respect to an ultimate centre of authority. And his elaboration of the implications of sovereignty through a vast synthesis of comparative public law helped to launch a whole new literary genre.

Bodin's doctrine of sovereignty, however, was seriously flawed by his erroneous views on the indivisibility of sovereignty. He believed that all the powers of the state had ultimately to be concentrated in a single individual or group. This was presented not only as a recommendation of political prudence but as the analytic condition of a coherent and coordinated legal system. Bodin could thus conclude that a mixed constitution, in which the prerogatives of sovereignty were shared or separated, was logically impossible. He therefore failed to see that shared or separated powers produced a compound sovereign, the components of which were coordinated by an underlying basic norm, or rule of recognition, accepted by the general community. Sovereignty, for Bodin, was always that of a ruler. What he needed, but could not imagine, was some notion of constituent authority distinct from the ordinary power of a government. (see Constitutionalism §1; Sovereignty §§1, 3)

3 Public law - the French monarchy and absolutism

Bodin's rejection of the mixed constitution would ultimately lead him to an absolutist interpretation of the French and other monarchies of Western Europe. (see Absolutism §§2-3). This was not his original intention, and in his *Methodus ad facilem historiarum cognitionem (Method for the Easy Comprehension of History)* (1566), he worked with a notion of limited supremacy. Ten years later, however, he had come to the conclusion that sovereign authority was absolute as well as indivisible. This seems to have resulted in part from further reflections on the logic of undivided power and in part from his deep fears of imminent anarchy arising from challenges to royal authority in the renewed religious wars. In the *République* Bodin developed an absolutist interpretation of the French kingship as well as of the Spanish and the English, which supplied a conservative reply to existing doctrines of resistance. Yet it must be emphasized that Bodin was no friend of arbitrary governance. Although a proper king was absolute juridically, prudence and decency required that he seek the advice of the Estates and respect the judgments of the *Parlements*. The king, moreover, was limited, morally at least, by the law of nature as well as by certain fundamental laws on the organization of the crown and its domain (see Natural Law). The law of nature, furthermore, was rigorously interpreted, and it even prohibited, at least in Bodin's reasoning, the imposition of new taxes without consent. The critical point for him politically was that a king's obligation to the law of nature was owed to God alone. Resistance by subjects was thus excluded, for according to contemporary notions, resistance to an authority that was absolute in the sense of not responsible to human agents was forbidden by the law of God.

4 Other contributions to social theory

Bodin's account of sovereignty and public law was only one of many pioneering contributions to social theory. His *Methodus* of 1566, which was a guide to the profitable study of universal history, included a critical method for evaluating historical statements, a system of universal chronology and a theory of progress in the arts and sciences, as well as an extensive preliminary exposition of his theory of public law. And both the *République* and the *Methodus* contain a long chapter, clearly anticipating Montesquieu, on how climate and geography shape the social and political temperament of nations. In *La response de Jean Bodin à M. de Malestroit (The Response of Jean Bodin to the Paradoxes of M. Malestroit)* (1568), Bodin explained the price revolution of the sixteenth century as the result of the sudden influx of precious metals from America. Although anticipated somewhat by Copernicus, he was the first to arrive at a clear explanation of the quantity theory of money. His thesis, furthermore, was illustrated and proven by a reconstruction of the historical movement of French prices, which was a model of sophisticated economic historiography. And his findings on the movements of bullion and goods across national boundaries led him to shrewd observations on the international division of labour.

5 Religious thought

Bodin's religious thought was also strikingly bold and highly influential. His main work on religion, the *Colloquium heptaplomeres de rerum sublimium arcanis abditis (Colloquium of the Seven about Secrets of the Sublime)*, was to seem scandalously freethinking to contemporaries. Probably written around 1593, Bodin left it in

manuscript form and wanted it burned upon his death. It survived in manuscript and obtained underground circulation among scholars until it was finally published in the nineteenth century.

Bodin seems to have resolved his lifelong search for religious truth with a theistic form of Neoplatonism (see Neoplatonism §5). Neoplatonic religiosity had strong appeal to Renaissance intellectuals. But Bodin's version is distinctive, however, in that it is Judaized and very strictly unitarian. Speculative reason teaches us that God exists, that he orders the cosmos by his angels and demons, and that he reveals his will for humankind and his purposes in history by inspiring his prophets. Thus disciplined, speculative reason conducts humans to their highest good, which consists of a kind of mystic unity with God. As Bodin describes it in the *Paradoxon (The Paradox of Jean Bodin)* (1596a), this unity is not, and cannot be, a participation in divinity, or even an active form of contemplation. It is rather a passive opening to God, by way of contemplation, that allows God's light to enter and illuminate the soul. Properly ordered, all aspects of life, both intellectual and moral, are subordinated to this goal. The science of nature, which Bodin treats in his *Universae naturae theatrum (Theatre of Nature in its Entirety)* (1596b), teaches the wonders and beauties of God's creation. Contemplative wisdom, however, leads beyond science in bringing us closer to God and culminates in illumination, the content of which, for those chosen to receive it, is the gift of prophetic powers.

Although this approach to God is possible in all religions, Judaism is held to be the oldest and truest, and the revelations of its prophets and sages are said to be the best. Christianity is portrayed as flawed, not only for its trinitarianism but also for its doctrine of original sin and the need for a saviour. Nevertheless, it is not the purpose of the *Colloquium heptaplomeres* to prove the claims of any one of the revealed religions. All the interlocutors - each representing a different theological position - agree that the differences among them cannot be resolved by argument, that sincere worship in any of the positive religions is pleasing to God, and that they will agree to disagree in the tolerant spirit of Venice, which is the imagined locale of the colloquium.

With respect to public policy, Bodin's recommendations, although still liberal for the time, are more cautious and politically aware. Where religious uniformity existed, it was to be preserved no matter what its form, since politico-religious factionalism was among the worst of evils. Since a state religion would not be unacceptable to God, the philosopher could observe it outwardly, while cultivating truth in private. But forced conversions are always to be shunned, and where a religious minority has become numerous, limited toleration is the prudent course.

Bodin's religious mysticism also had its darker side. He believed in astrology and numerology and attempted to apply both to political science. Darker still was his all too influential book, *De la démonomanie des sorciers (On The Demon-mania of Witches)* (1580), on the detection and punishment of witches. Nevertheless, these deviations into superstition were not uncommon in the Renaissance and ought not to obscure the fact that Bodin's religious thought was a significant moment in the development of universalism and religious toleration. This body of thought, together with his contributions to political and social theory, entitle him to be regarded as one of the foremost thinkers of his time.

Boehme, Jakob (1575-1624)

Boehme was a Lutheran mystic and pantheist. He held that God is the Abyss that is the ground of all things. The will of the Abyss to know itself generates a process that gives rise to nature, which is thus the image of God. Life is characterized by a dualistic struggle between good and evil; only by embracing Christ's love can unity be regained. Boehme was highly regarded by such diverse writers as Law, Newton, Goethe and Hegel.

A Lutheran theosopher, with a predilection for both mysticism and philosophy of nature, Jakob Boehme was a Silesian, a native of Alt Seidelberg near Görlitz. Situated between Catholic Poland and Lutheran Saxony, Silesia was a haven for heterodoxies in the late sixteenth century, although its tradition of hospitality ended abruptly with the Thirty Years War. Boehme spent most of his life in Görlitz, as a member of the Cobblers' Guild. He was an astute businessman, who had no formal training in the liberal arts but read voraciously and wrote inspiringly. His first mystical experience was in 1600, when he contemplated the 'Being of all beings, the Byss and the Abyss' in the sunlight reflected in a pewter dish.

Published in 1612, *Morgenröthe im Anfang (The Red Light at Dawn)* was Boehme's first attempt at solving the problem of theodicy. It immediately incurred the condemnation of Görlitz's Lutheran church. He was forbidden to write further, but his reputation was established. Boehme kept silent for seven years and then released the *Beschreibung der drey Principien Göttliches Wesen (Concerning the Three Principles of the Divine Essence)* in 1619, and *Hohe und tieffe Grund von dem drey fachen Leben des Menschen (The High and Deep Searching Out of the Threefold Life of Man)*, *De incarnatione verbi (On the Incarnation of the Word)*, *Sechs theosophischen Puncten (Six Theosophic Points)* and *Kurtze Erklärung von Sechs mystischen Puncten (Short Exposition of Six Mystical Points)* in 1620. A large commentary on Genesis, *Mysterium magnum (The Great Mystery)*, came out in 1623, followed in 1624 by a collection of small treatises, *Der Weg zu Christo (The Way to Christ)*. Written in 1622, *De signatura rerum (The Signature of All Things)* was posthumously published in 1635.

Like Valentin Weigel (1533-88), a subjective pantheist, Boehme began with the self, but he emphasized its will. The self, the source of all knowledge, is derived from the universal feeling for life (*Lebensgefühl*). Boehme saw himself as an agent of the Spirit, which, in his worldview, began the process of self-understanding that culminated in the inner vision of a universally present and active Christ. What is God? He is the Abyss (*Ungrund*), the ground of all things, the undifferentiated absolute, the eternal, natureless, unconscious Nothing that lies at the foundation of everything. At the core of the Abyss lies a will to self-intuition. This will initiates the process of self-knowledge, and its outgoing dynamic activity creates the inner world, which is the prototype of the outer world. In the self-noetic process, the will of the Nothing searches for something and discovers it within itself. Eternal nature finds its being in this process. With differentiation emerge evil, dualism and conflict. Boehme's voluntarism, which bears Luther's mark, is coupled with the doctrine of the Trinity and flavoured with the Manichean dualism of light and darkness, good and evil, love and hatred, grace and wrath.

For Boehme, nature is the image of God; he thus formulated the identity of God with nature half a century before Spinoza (§2). He also framed a theory of seven natural properties. In a letter dating from 11 November 1623, which furnishes a clear compendium of his metaphysics, Boehme defines these seven properties as desire, sensation, anxiety, fire, light, sound and being. The Trinity arises from the unfathomable will of the Father, which creates for all eternity the unfathomable will of the Son; from both emanates the Spirit, the 'moving life' that mirrors both the Father and the Son. History is where the struggle for life unfolds, which Boehme describes as a fight between good and evil, where the decision for or against God is made. Meaning is to be found in Christ. The purpose of life is to retrieve the lost unity by allowing the fire of love, Christ's heart, to embrace everything. Life should therefore be an imitation of Christ's suffering and triumph.

Boehme's theosophy, which can be characterized as a preparation for the mystical acknowledgement of Christ, shows the influence of Neoplatonism, Gnosticism, kabbalism, Paracelsian pansophism, Caspar Schwenckfeld's spiritualism, and Sebastian Franck's humanistic illuminism. Boehme's influence has been considerable. He was the most often translated German author of the seventeenth century. Descartes, Spinoza, the Cambridge Platonists and Newton read his works. His cosmic, metaphysical and ethical dualism enchanted the Romantics Novalis, Tieck and Goethe. Hegel celebrated him as the first true German philosopher, and Schelling owed to him his philosophy

of identity. Besides a crucial influence on the devotional writer William Law, the quietist Antoinette Bourignon and the poet William Blake, Boehme had an ecclesiastical following in the Low Countries (The Invisible Church of the Angel's Brothers) and in England (The Philadelphians).

JEAN-LOUP SEBAN

List of works

Boehme, J. (1955-61) *Sämmtliche Schriften*, ed. W.-E. Peuckert, Stuttgart: Frommanns, 11 vols.(The standard edition of Boehme's works.)

Boehme, J. (1612) *Morgenröthe im Anfang* (The Red Light at Dawn), trans. J. Sparrow, ed. C.J. Barker and D.S. Hehner, *The Aurora*, London: J.M. Watkins, 1960.(Written to preserve the memory of his mystical experience, and to probe God's relation to the world and its evils.)

Boehme, J. (1619) *Beschreibung der drey Principien Göttliches Wesen*, trans. J. Sparrow, ed. C.J. Barker, *Concerning the Three Principles of the Divine Essence*, London: J.M. Watkins, 1910.(A secretly composed and very opaque work in which Boehme dips into alchemy and astrology to 'clarify' his previous book.)

Boehme, J. (1620a) *Hohe und tieffe Grund von dem drey fachen Leben des Menschen*, trans. J. Sparrow, ed. C.J. Barker, *The High and Deep Searching Out of the Threefold Life of Man*, London: J.M. Watkins, 1909. (Boehme's system deepens: God is the absolute person who reveals himself by creating the world which is known by human thought.)

Boehme, J. (1620b) *De incarnatione verbi, Von der menschwerdung Jesu Christi*, trans. J.R. Earle and S.R. Webster, *De incarnatione verbi: Of the Incarnation of Jesus Christ*, London: Constable, 1934.(Sections on the Incarnation and Mary, the Christian's union with Christ's cross, and the way to being one in Spirit with God.)

Boehme, J. (1620c) *Sechs theosophischen Puncten*, trans. J.R. Earle, in *Six Theosophic Points and Other Writings*, Ann Arbor, MI: University of Michigan Press, 1958. (English edition printed with 1620d and other works. Further expansions and descriptions of Boehme's complete scheme.)

Boehme, J. (1620d) *Kurtze Erklärung von Sechs mystischen Puncten* (Short Exposition of Six Mystical Points), trans. J.R. Earle, in *Six Theosophic Points and Other Writings*, Ann Arbor, MI: University of Michigan Press, 1958.(See 1620c for further details.)

Boehme, J. (1620e) *Viertzig Fragen von der Seele*, trans. J. Sparrow, *Forty Questions on the Soul and The Clavis*, London: J.M. Watkins, 1911.(Further complexification of the system: Boehme treats God as the Ungrounded One who objectifies himself.)

Boehme, J. (1623) *Mysterium magnum* (The Great Mystery), trans. J. Sparrow, ed. C.J. Barker, London: J.M. Watkins, 2 vols, 1941.(A substantial commentary on the book of Genesis; the English translation leaves some material out.)

Boehme, J. (1624) *Der Weg zu Christo*, trans. P.C. Erb, *The Way to Christ*, New York: Paulist Press, 1978.(Nine mystical treatises: the best introduction to Boehme's spirituality.)

Boehme, J. (1635) *De signatura rerum*, trans. J. Ellistone, *The Signature of All Things, With Other Writings*, London and Cambridge: J.M. Clarke, 1969.(The original subtitle in English (1651) shows the ambition of Boehme's system: 'shewing the sign and signification of the severall forms and shapes in the creation, and what the beginning, ruin, and cure of every thing is'.)

Boehme, J. (1763-81) *The Works of Jacob Behmen, the Teutonic Theosopher*, trans. J. Sparrow and J. Ellistone, London: M. Richardson; microfilm, New Haven, CT: Research Publications, 1973.(This English edition contains a sketch of Boehme's life by William Law.)

Boehme, J. (1963-6) *Die Urschriften* (The Original Manuscripts), ed. W. Buddecke, Stuttgart: Frommanns, 2 vols.(A critical edition of previously unpublished materials.)

Boehme, J. (1989) *Jacob Boehme: Essential Readings*, ed. R. Waterfield, Wellingborough: Crucible.(Some obscure texts, fragments and letters which together provide an overview of Boehme's thought.)

Boethius of Dacia (*fl. c.*1275)

Boethius developed an original theory of scientific knowledge designed to reconcile science with Christian doctrine without allowing one to determine the contents of the other. His main strategy was to consider each science as an independent system of axioms and theorems while also operating with a hierarchy of causes, the highest of which (God) is fundamentally unpredictable as to its operations. Boethius did, however, stress the powers of the human intellect and the possibility of reaching happiness through rational understanding; he vigorously objected to demands that natural science should adapt its axioms to the demands of Christian faith. This laid him open to suspicions of heresy. Boethius' work on grammar is the most complete application of his ideas of how to construct a science.

1 Life and works

All information about Boethius' life before 1277 is contained in the number and nature of his extant or attested writings, and in the title and the epithet accompanying his name in medieval sources, 'Magister Boethius de Dacia' or 'Dacus', which identifies him as a Dane. All his works, whether preserved or only attested, are such as a medieval master of arts would produce. Their number and quality suggest a rather long career, starting perhaps about 1265. If he was a master of arts by then, he cannot have been born much later than 1240.

Among his surviving works, the best known are the treatises *De summo bono (On the Highest Good)* and *De aeternitate mundi (On the Eternity of the World)*. However, there are a number of extant works in other fields, including logic (a sophisma on meaning, truth and knowledge, and *Quaestiones super librum Topicorum (Questions on Aristotle's Topics)*, natural philosophy (questions on Aristotle's *Physics* and *On Generation and Corruption* - the extant version of the questions is a reworking by someone else of Boethian material) and grammar (a sophisma, *Quaestiones super Priscianum maiorem (Questions on Priscian)*). His questions on Aristotle's *Metaphysics* has been lost, but passages borrowed from it seem to be preserved in a near-contemporary anonymous work. Boethius also wrote one of the very first Latin commentaries on Aristotle's *Rhetoric*, which appears to be irretrievably lost.

During the 1270s, Boethius taught at the University of Paris. In 1277, Etienne Tempier, Bishop of Paris, accused unnamed masters in the faculty of arts of propagating un-Christian doctrines and specifically prohibited the teaching of any of 219 theses (see Aristotelianism, medieval). Many of these theses were extracted from Boethius' works. It is the general, but unproven, assumption that he was still at Paris at the time of the condemnation of 1277, and that this event halted his university career. He may have sought a new life among the Dominican Order, for although he was almost certainly a secular during his regency (active professorship) in arts, his works occur in a medieval catalogue of books composed by Dominicans. Some of his books and ideas lived on, but Boethius himself was soon forgotten; only in the twentieth century has he re-emerged as an important figure in the history of philosophy.

2 Ethics, theory of knowledge and science

Boethius was an epistemological optimist. Real knowledge, even some knowledge about the First Cause, he thought, is within human grasp. The full realization of human nature, happiness, is the philosopher's life in which all lower powers are directed towards the supreme activity, the contemplation of truth, and of the First Truth in particular. By contrast, the layman's uncontemplative life is only quasi-human. As was common in his day, Boethius assumed a hierarchical structure of reality in which beings can be arranged on a scale according to their proximity to the First Cause. His philosopher first achieves an insight into the causal structures of the material (sublunary) world and thence proceeds to an understanding of higher forms of being, which are causes in relation to the lower ones. Eventually he arrives at the contemplation of the First Object of Knowledge, the First Cause.

Such intellectualism was not unusual for the time. Boethius' peculiar contribution was the way he connected it with a theory of science, based on Aristotle (in particular on the *Posterior Analytics*) but also inspired by the stylized disputations of thirteenth-century university life. To Boethius, the objects of knowledge are 'things with regard to their causes', not simply individual things nor hypostasized quiddities (or essences), for he would accept no uninstantiated quiddities. The proposition 'every human being is an animate being' expresses a piece of

knowledge about the (formal) cause of human beings, but since the existence of humans is contingent, Boethius claimed that the proposition is false unless taken to mean ‘supposing there exists at least one human being, it is true that every human being is an animate being’. Scientific propositions are only conditionally true, on the presupposition that their subject terms have referents, and in the natural sciences this presupposition could fail to be satisfied.

Each science has its own primitive terms and propositions, and each science incorporates insight into one causal network. However, one thing may enter into more than one network and one type of cause may annihilate the effect of another. To Boethius, scientific activity was similar to participation in a rule-governed university disputation in which a proposition should be granted or denied according to whether it cohered or not with certain other propositions, rather than on the basis of correspondence with external facts. He held that as long as one works within some particular science, *A*, one should grant any theorem properly derived from the axioms of *A* and deny any proposition inconsistent with them. The tacit presupposition is that there are such things as the objects of science *A*, and that only the causal mechanisms known through *A* are at work. In actual fact foreign causal mechanisms, known perhaps to science *B*, may prevent the predictions of *A* from corresponding to reality. Boethius may be said to have held a coherence theory of truth within a science, and a correspondence theory of truth simpliciter (see Truth, coherence theory of; Truth, correspondence theory of).

The hierarchy of entities and causes provides an explanation of why the work of lower causes can be frustrated by higher ones, and why the assumption of a divine free will makes the First Cause not totally transparent. Consequently, it is not possible to unify all sciences into one science of the First Cause (see Causation).

In Boethius’ view, it follows that the same person can consistently hold that it is a truth of natural science that every human being had a father and mother, and a revealed truth that there was a first couple of humans with no parents. The revealed truths are truths simpliciter, but truths knowable only thanks to revelation cannot be incorporated into scientific theories on pain of inconsistency. In this way Boethius tried to solve one of the burning questions of his day, how to reconcile faith and natural science, which seemed to clash over the question whether there can have been a beginning of the world as a whole and of natural species. Standard theology took the doctrine of creation to imply that the world is not infinitely old; standard science implied the contrary (see Creation and conservation, religious doctrine of; Eternity of the world, medieval views of; Natural philosophy, medieval).

3 Grammar

We see Boethius’ theory of science at work in his grammar. Grammar, he held, deals with the ways humans can express what their minds have grasped. Concepts have a core corresponding to the core, or ‘common nature’, of real entities, attended by ‘modes of understanding’ corresponding to ‘modes of being’ of the common nature, that is, ways in which it can manifest itself. The linguistic expression of a concept has a core, the significate (what is signified) attended by modes of signifying. For example, if someone’s back is aching, the pain is in one way something static like a substance and can carry accidental properties: thus it can be more or less acute. In another way, the pain is an accidental entity in the process of actualization. Pain ‘is’ in both ways, and is conceptualized in both ways; it is also signified in both ways, statically by the noun ‘a pain’, processively by the verb ‘to ache’.

It is none of the grammarian’s business to investigate what things there are or what properties they have; grammaticality is not measured by correspondence with the external world, so a grammatical explanation must never appeal to properties of the significate of a word. Nor can grammar establish the inventory of modes of signifying; they are a function of the modes of understanding which in turn are a function of the modal structure of extramental reality. To the grammarian, the modes of signifying are primitive terms. Neither can the grammarian predict what sounds will embody the significates and the modes of signifying. Any sound may conventionally represent any significate or mode of signifying, and languages may vary considerably; thus Greek (Boethius mistakenly thought) uses separate words (articles) to express what in Latin is expressed by the inflexion of nouns (case, number). What a Boethian grammarian can do is formulate the rules governing which combinations of modes of signifying yield well-formed sentences if instantiated. The rules of grammar are independent of the existence of any sentence of any language, but no actual sentence in any language can be fully intelligible if it breaks the rules (see Language, medieval theories of; Language, philosophy of). By strictly separating grammar from metaphysics, psychology and other sciences, Boethius tried to transform it into a formal discipline like

geometry or logic, unshakeable by any contingent fact but also unable to support deductions about the extralinguistic world.

Boethius, Anicius Manlius Severinus (*c*.480-525/6)

Boethius was a principal transmitter of classical Greek logic from Aristotle, the Stoics and the Neoplatonists to the schoolmen of the medieval Latin West. His contemporaries were largely unimpressed by his learned activities, and his writings show him to have been a lonely, rather isolated figure in a world where the old Roman aristocrats were struggling to maintain high literary culture in an Italy controlled by barbarous and bibulous Goths, whose taste in music and hairgrease Boethius found painful.

Boethius himself was born into a patrician family in Rome, but was orphaned and raised instead by Q. Aurelius Memmius Symmachus, a rich Christian heir to a distinguished pagan line; Boethius later married the latter's daughter, Rusticiana. As well as Symmachus, Boethius had a small circle of educated friends, including the Roman deacon John (who probably became Pope John I, 523-6), who shared his enthusiasm for logical problems. The Gothic king of Italy at Ravenna, Theoderic, had met high culture during his education at Constantinople and made use of experienced Roman aristocrats as administrators. He employed Boethius to design a sundial for the Burgundian king and also a waterclock, specimens of advanced technology intended to impress a barbarian; he also sent a harpist to Clovis, the Frankish king, no doubt intended to soften the latter's bellicose spirit.

By 507 Boethius had gained the title 'patrician' and received letters addressed to 'your magnitude'. Symmachus was in a position to promote his public career. He was nominated consul for the year 510, a position without political power but of high standing and requiring large disbursements of private wealth; it also carried the perquisite that the consul's name stood on all dated documents for that year. In 522 his two sons were installed as consuls, a promotion that gave their father intense pride and pleasure, and he took up seriously the political post of Master of the Offices. In this capacity, his determination to eliminate corruption earned him numerous enemies among both Goths and his fellow Roman aristocrats. His relations with the courtiers at Ravenna became disastrous.

Boethius' fall came when he rashly defended a senator who had been delated to King Theoderic for conducting treasonable correspondence with persons high in the court of the emperor at Constantinople. There is no improbability in the notion that, along with other Roman aristocrats, Boethius would have preferred to be rid of the crude Goths and to see Theoderic replaced by a ruler congenial to the emperor. His great erudition had aroused fears that he was engaged in occult practices dangerous to the Ravenna dynasty. In 524 or early 525, Boethius was imprisoned at Pavia (Ticinum). Here, while awaiting the execution already decreed against him, he composed his masterpiece, De consolatione philosophiae (The Consolation of Philosophy).

De consolatione philosophiae, a bitterly hostile attack on Theoderic prefacing a philosophical discussion of innocent suffering and the problem of evil, must have been smuggled out of prison, no doubt with the aid of gold coins from Rusticiana or Symmachus. In the ninth century, the work captured the imagination of Alcuin at the court of Charlemagne, became a standard textbook in schools and was set on the way to being one of the greatest books of medieval culture, especially popular among laymen.

Boethius' earlier works have been the preserve of more specialized readers, especially concerned with the history of ancient philosophy. His stated original intention was to educate the West by translating all of Plato and Aristotle into Latin and to supply explanatory commentaries on many of their writings. That was too ambitious. He did not proceed beyond some of the logical works (Organon) of Aristotle, prefaced by a commentary on a Latin translation of Porphyry's Isagōgē(Introduction) made in the fourth century by Marius Victorinus, an African teaching in Rome, and then by a second commentary on a translation of the same text made by himself. This commentary underlay the medieval debates on universals. He also wrote a commentary on Aristotle's Categories and two commentaries on Aristotle's De interpretatione. In addition, Boethius adapted Nicomachus of Gerasa's Arithmetic for Latin readers, Nicomachus' introduction to music as a liberal art, a commentary on Cicero's Topics, a short treatise 'On Division', important treatises on categorical and hypothetical syllogisms and a further tract on different kinds of 'topic'.

Intricate theological debates between Rome and Constantinople convinced him that a trained logician could contribute clarification, and he composed four theological tractates on the doctines of the Trinity and the person of Christ, concentrating on logical problems. In addition, a fifth tract became a statement of orthodox belief

without much reference to logical implications. The five pieces, or Opuscula sacra, became hardly less influential than De consolatione philosophiae, especially from the twelfth century onwards. We hear of critics who thought contemporary theologians knew more about Boethius than about the Bible.

1 Life

Boethius was born in Rome into a wealthy Christian family of senatorial standing, in an age when barbarian soldiers ruled and the old aristocratic families had yielded power to them, yet remained indispensable to their Gothic masters for the good order of civil administration. Under the rule of the Ostrogoth king Theoderic, the old Roman families continued to assert their Roman-ness by the study and re-editing of classics of Latin literature - Livy, Cicero, Virgil, Seneca and so on - but also by retaining a politically hazardous contact with the eastern Roman emperor in Constantinople. Boethius' father died when Boethius himself was young, and he was taken in by Q. Aurelius Memmius Symmachus, whose daughter Rusticiana he later married.

The best-educated person of his time in the West, he could read Greek, even if not quite fluently, and his works are rich in literary allusions and reminiscences. He was well read in the Neoplatonic commentators on the logical and other writings of Aristotle, especially Porphyry and Proclus. He was also familiar with at least some of the major writings of Augustine of Hippo, and wrote five theological tractates (*Opuscula sacra*), four of which are devoted to clarifying logical problems in orthodox Catholic doctrine, especially in regard to the doctrines of the person of Christ and the divine Trinity. The quest for acceptable language to express Christian belief on these themes had a bearing on the break in communion between the papacy and the patriarchate of Constantinople from 484 to 518. Boethius and his circle of aristocratic friends in Italy were concerned to heal this breach, and this aspiration led him to attempt to use his dialectical skills to define the terms more closely than had been done previously. The set of five tracts on theology provided influential themes for exegesis by commentators in medieval times, especially during the twelfth and thirteenth centuries, including Thomas Aquinas. However, the contacts with Constantinople and the religious disagreements between the Arian Theoderic and the Orthodox Emperor Justin also played a part in bringing about Boethius' death. To Dante, he was a martyr and hero, and on 23 October 1883 his veneration as a saint was authorized at Pavia.

In his twenties, Boethius embarked on a programme of translation, commentary and adaptation to make available to the Latin West the logic of Aristotle and the standard Greek texts on the four mathematical 'arts', arithmetic, geometry, music and astronomy, for which he coined the term 'quadrivium', parallel to the 'trivium' of grammar (that is, literature), rhetoric and dialectic. Soon, King Theoderic was inviting him to revise the coinage system, to design a waterclock and sundial to send to the Burgundian king Gundobald and to review the system of weights and measures. He was asked to select a harpist to send to Clovis the Frankish king. His intellectual powers and the patronage of his powerful father-in-law Symmachus launched him on a meteoric career in the civil administration. He was nominated consul for 510; his young sons were consuls for 522, when he also delivered a panegyric on Theoderic (a text now lost but known to Cassiodorus). In the same year he became Master of the Offices, a post of considerable power, from which he tried to root out bribery and corruption in the bureaucracy, thereby ensuring that he made many enemies. He understood himself to be following Plato's principle that philosophers must accept government posts since, if they do not do so, wicked gangsters take over.

In 519 Theoderic's heir presumptive died, and speculation about his successor was rife. Boethius rashly defended another senator suspected of a correspondence with Constantinople, an act regarded by King Theoderic as treasonable. In the Eastern empire the new emperor Justin, guided by his nephew Justinian, had a programme of suppressing heresy to give social cohesion, and the sects being harassed included the Arians. However, Theoderic and his Gothic soldiers had received their faith from Arian missionaries. The eastern Roman imperial policy of intolerance therefore appeared to Theoderic at Ravenna as an ambition to eliminate both heresy and Goths in Italy. Tension became high, and Boethius was accused by other Roman aristocrats, keen perhaps to dissociate themselves from someone suspected of dangerously pro-Byzantine sentiment, and was imprisoned at Pavia (Ticinum) and sentenced to death. During his many months awaiting execution he wrote *De consolatione philosophiae (The Consolation of Philosophy)*. The scorn and hatred for Theoderic and other powerful Goths shown in the first book of this work, which was probably smuggled out of prison by his wife and other influential friends, proves that he was not writing an ingratiating work to submit to Theoderic in hope of a reprieve.

In effect, Boethius in his prison was a hostage under deteriorating conditions, being used by Theoderic in an

unsuccessful attempt to restrain Byzantine political and religious aspirations. Late in 525 or possibly early in 526 he was subjected to vile tortures and battered to death. Under Theoderic's anger his father-in-law Symmachus and his intimate friend Pope John I also lost their lives. A Ravenna chronicler, the so-called Anonymus Valesianus, thought that Arian heresy had addled the king's brain and deprived him of his wits. The Byzantine historian Procopius reports a story that Theoderic was haunted by guilt and died in bitter remorse (on 30 August 526). The king may well have come to perceive that the killing of Boethius and others had played into Constantinople's hands, enabling the Byzantine emperor to undermine the general admiration hitherto felt in Italy for Gothic government in cooperation with the old Roman families. Boethius' tomb is in the church of Ciel d'Oro at Pavia.

2 Works

De consolatione philosophiae (in late Latin *consolatio* came to mean help or support) owes its survival to being discovered in the ninth century, probably by Alcuin (see Carolingian renaissance), and was to become Boethius' most widely read work. Pervaded by passionate feeling, composed in a sophisticated Latin in alternating passages of verse and prose and in the last two books handling complex philosophical ideas such as, for example, divine providence, human freedom, eternity and time, the work became a major classic of western literature. The emergence of the *De consolatione philosophiae* and of the *Opuscula sacra* in the ninth century, followed soon after by the logical works, made Boethius' writings important in medieval education. Boethius taught good morality and fine Latinity in an age when both were hard to get. From this time onwards there survive a number of commentaries on the *De consolatione philosophiae*, as much concerned with style and metre as with the content of the argument. That initially the primary function of the work was educational is illustrated by manuscripts of the Latin text with marginal notes in vernacular languages. *De consolatione* also attracted vernacular translators; in England these included King Alfred in the ninth century and Geoffrey Chaucer in the fourteenth. The earliest of several German translations is by Notker of St Gallen *circa* 1010; Jean de Meun translated the work into medieval French in the late thirteenth century, and Jacob Vilt of Bruges translated it into Dutch in 1462. Queen Elizabeth I was among the later translators in England. In the Byzantine world, a Greek translation of *De consolatione philosophiae* was produced by Maximos Planudes (1260-1310), the humanist and monk who also produced a Greek version of Augustine on the Trinity. His translations reflected his support for the contemporary effort by Emperor Michael VIII to avert further military aggression from the West by ending the schism between Constantinople and Rome.

De consolatione philosophiae's first book protests that its author was innocent of the charges brought against him based on forged letters. Then, in contemplation of his hopeless position, the work moves on to a philosophical vindication of the goodness of providence, even in a world where the just are not rewarded with prosperity and the wicked are allowed power. *De consolatione* is a clearly religious work written by a Christian, and yet it is not a Christian work in the sense that it contains nothing about the forgiveness of sins or redemption. Nevertheless, while turns of phrase are much more Neoplatonic than Christian, there is one clear quotation from the Bible (III pr.12. 23-4). There Boethius expresses special pleasure at the fact that the lady Philosophy uses some words from the Wisdom of Solomon, admittedly to reinforce a truth of natural, not revealed, theology. As the title indicates, the work sets out to present the philosophical arguments for a Platonic theodicy, a subject to which all Platonists needed to give some attention and which in late antiquity was specially studied not only by Proclus but also by Hierocles of Alexandria (see Neoplatonism).

The *Opuscula sacra* regard faith and reason as independent but parallel and compatible ways of attaining to higher metaphysical truths, and the independent validity of logical reasoning is also an underlying presupposition throughout *De consolatione*. The apparently conscious reticence of *De consolatione* about Christianity led to conjectures, beginning in the eighteenth century, that perhaps the *Opuscula sacra* were by a different author. More recently it has been proposed that, under the stress of his misfortunes and perhaps in disappointment that the Pope and bishops were impotent to help him, Boethius abandoned Christianity and in his last work wrote as a pagan apostate. The manner of the citation from the Wisdom of Solomon makes the last conjecture inherently unlikely, and the old assumption that *De consolatione* presents Neoplatonic philosophy while the *Opuscula sacra* do not fails to withstand critical examination. In any event a fragment of Cassiodorus records subjects on which Boethius had written, and these include 'a book on the Holy Spirit and some dogmatic chapters and a book against Nestorius'. Cassiodorus, who succeeded Boethius immediately as Master of the Offices, clearly understood him to be a believer. The intention of the *De consolatione philosophiae* is to explore the philosophical arguments in

defence of belief in providence, where, if there is authority, it is located in Plato. Boethius had certainly read the three studies of providence written by Proclus, and in *De consolatione* I pr.4.30 cites loosely from Proclus' commentary on Plato's *Parmenides*: 'If there is a god, whence comes evil? Whence comes good, if there is not?' There are also themes from Proclus in the *Opuscula sacra*. In writing on the Trinity, Boethius uses the analysis of the relation between identity and difference discussed by Plato (§§15-16) in the *Sophist* and the *Parmenides* and thereafter by Proclus in his commentary on the *Parmenides*. The face that meets us in the *Consolatione* is identical with that of the *Opuscula sacra*.

Of the five *opuscula* on Christian theology, the fourth 'on Catholic Faith' stands apart and, as early as Reginbert of Reichenau in the ninth century, has been thought by some to belong to a different author. However, the manuscript tradition shows that it formed part of the corpus from a very early stage, and its diction is demonstrably Boethian. It states what believers accept on authority, succinctly summarizing Augustinian doctrine, and contains no allusion to the logical problems which mark the other four *opuscula*. The tractate 'Against Eutyches and Nestorius' is among Boethius' most original pieces, addressed to the confusions of thought and language in the debate about the unity of the person of Christ which, since the council of Chalcedon in 451, had split the Greek churches. Successive attempts at formulas of reconciliation angered the popes by implications that the controversy had not been fully settled by Pope Leo the Great. Boethius discerned confusion over the terms 'nature' and 'person', defining the latter as 'the individual substance of a rational nature'. In his second commentary on Aristotle's *De interpretatione*, 'person' is the incommunicable quality of a human individual. The third tractate answers questions put by John (probably the future Pope John I) arising out of another paper entitled *Hebdomads (Groups of Seven)*. A highly Neoplatonic piece, without theology, it inquires 'how substances are good in that they exist, yet are not substantial goods'. The influence of Proclus is pervasive. The second tractate on the Trinity illuminates the belief that God is one, yet three (in a way that Augustine thought hard to define in the traditional terms such as person or substance) by using the observation that to say two entities are 'the same' implies some distinction between them. Identity and difference are mutually related concepts.

De consolatione philosophiae reflects a mind soaked not only in classical Latin poetry but also in the arguments and philosophical methods of Aristotle and his Neoplatonic commentators. Boethius' declared programme was to translate all the works of Plato and Aristotle. He was persuaded by the contention of Porphyry (mirrored also in Augustine's *Contra academicos (Against the Academicians)*) that in the basic essentials Plato and Aristotle were not in disagreement. Dialectic had long shared with grammar (that is, the study of literature) and rhetoric an important place in the trivium of elementary education. However, dialectic could claim more, even that it was an indispensable instrument in all mental skills. The 'liberal arts' (the skills necessary for the education of a gentleman) included not only the trivium but also the four mathematical 'arts', arithmetic, music, geometry and (theoretical) astronomy. For these four, Boethius coined the term 'quadrivium'. In Platonic and Pythagorean education these were skills which trained the mind to cope with immaterial realities.

Boethius' intention to translate Plato came to nothing, but from 504 onwards he did serious work on Aristotelian logic. Porphyry's *Isagōgē(Introduction)* to this subject had been translated into Latin by Marius Victorinus, an African who taught in Rome in the middle years of the fourth century and who had also translated Aristotle's *Categories* and some other works of Porphyry and Plotinus. The *Isagōgē*, written in the late third century (see Porphyry), was the standard preface to the study of Aristotelian logic and was generally used in the Neoplatonic schools; Greek Neoplatonists wrote commentaries on it. Boethius used Victorinus' version as his basis for a commentary but, as he wrote, became increasingly and justifiably critical of it; so, for a second commentary, he produced his own version. He also produced his own translations of Aristotle's *Categories* and *De interpretatione*, and provided them with commentaries. In the case of *De interpretatione* there were two commentaries, one short and simple and the other full-length. He also translated the *Prior* and *Posterior Analytics*, *Topics* and *Sophistical Refutations*, and his notes on the *Prior Analytics* have been preserved. Porphyry's first commentary on the *Categories* largely served as his model for this; Boethius does not appear to have known Porphyry's second exposition, but he had access to the commentary by his own contemporary Simplicius. Much labour has been expended on the determination of Boethius' sources, and here it must suffice to say that numerous parallels of thought and language show his intellectual milieu to be identical with that of the eastern Neoplatonists and their commentaries on the logical works of Porphyry and Aristotle. A constant feature of his translations was the desire to be meticulously accurate.

Boethius' treatises on logic overlapped in some degree with his commentaries. He wrote *De divisione (On Division)* (that is, on the classification of ideas), *De syllogismo categorico (On Categorical Syllogisms)* expounding the *Prior Analytics*, *De hypotheticis syllogismis (On Hypothetical Syllogisms)* harmonizing Aristotle and the Stoics, *De topicis differentiis (On Topical Differences)* and a commentary on Cicero's *Topics*, transmitted incomplete. Boethius also mentions some scholia of his on Aristotle's *Physics*, which have not survived. In these he probably drew on Simplicius' huge commentary.

Boethius' commentaries amass the opinions of numerous previous exegetes of Aristotle, often borrowing such matter from Porphyry who, as far as the earlier authors are concerned, had done most of the work already. One cannot assume that Boethius had himself read every author he cites, but it is probable that he had access to manuscripts of others beside Porphyry and Proclus. J. Shiel (1958) ingeniously but controversially suggested that he may have worked from a single codex of Aristotle's Organon with wide margins filled with summaries of the opinions of commentators, in the manner of the contemporary biblical *catenae*. It is in any event non-controversial that as a logician, Boethius did not set out to be original or independent of the Greek authorities, whose work he was 'sweating' to make available to the Latin world. At the same time he was something more than a simple transcriber of others, and wrote as a man personally engaged by the logical problems on which he was writing. The historian of ancient logic has good reason to be grateful for all that he preserves of which otherwise there would be insufficient or even no record. The treatise *De hypotheticis syllogismis* is more informative than any other ancient source about this part of Aristotelian dialectic. His contemporaries did not manifest much gratitude for his educational labours, and he often had occasion to refer to unkind critics. In his commentary on the *Categories*, he remarked candidly that with the general neglect of the liberal arts, much of the knowledge acquired by past generations would soon be lost. Nevertheless, we hear also of a small circle of influential admirers.

The curriculum of Neoplatonic education influenced him to produce adaptations of the *Arithmetic* of the second-century Pythagorean Nicomachus of Geras (Iamblichus' exegesis of which is extant), and of Nicomachus' treatise on music, the latter with some additional dependence on the *Harmonics* of Ptolemy (extant also). In both cases, Boethius' Greek models survive. The Neoplatonists accepted the traditional view that the study of the mathematical arts prepares the mind for the contemplation of immaterial realities. They followed Plato's *Timaeus* in seeing harmonic ratios and exact proportionality located in the very structure of the cosmos: for them, the distance of the planets from the earth was determined by musical theory (see Plato §16). One does not go to Boethius' work on music to learn anything of the practice of making ordered sound. His latent theme is the providential harmony of the heavens and the seasons, the mathematical principles that operate in music and hold the diverse elements together in the grand consonance of the world-soul, and that are therefore a clue to the secret concord of God and nature in a world where the only source of discord is the evil in the human heart.

Cassiodorus records an introduction to geometry by Boethius, but the work has not survived. Medieval writers filled the gap in his name. The early sections of *De consolatione philosophiae* imply some serious study of astronomy, perhaps even that his expert knowledge in this field had been brought into the accusations against him, as if he had been using astrological almanacs to predict the future succession after Theoderic. A sentence in a letter drafted by Cassiodorus may mean that Boethius had made some adaptation of Ptolemy on astronomy, but there is no trace of the work surviving.

3 Logic

In presenting Aristotelian logic to the Latin world, Boethius' first task was to explicate the *Isagōgē* of Porphyry, who was interested in showing the compatibility of Aristotle's dialectic with Platonic metaphysics. The book Porphyry wrote on that agreement is lost, but its influence is apparent in Augustine and in the Greek Neoplatonic commentators (see Neoplatonism). He was concerned to rebut Christian polemic against the disagreements of the philosophical schools and to establish agreement among his own authorities. A subject on which Platonists and Aristotelians differed was that of universals. Are they prior to particulars, or is it the other way round? If nothing exists beyond particulars, must not the mind find knowledge impossible? At least the mind needs to have the capacity to see together things that are somehow linked, and to hold related particulars together under a common species or genus (see Particulars; Universals). The issue required some treatment, especially in Boethius' second commentary on Porphyry; but he declined to give any verdict between Plato and Aristotle, saying that this question was one for more advanced inquiries. At least he was able to follow the Peripatetic Alexander of

Aphrodisias, who was ready to grant that if the universal has no existence, there can be no particulars.

Boethius' commentary on the *Categories* has a preface to Book II which firmly dates the work in 510, Boethius' consular year. He expresses regret that his public social duties have interfered with his educational task. He takes Aristotle's intention to be the examination of verbal distinctions and the provision of an elementary introduction to lead on to the higher truths of his metaphysics. Here and throughout, dependence on the extant but incompletely transmitted commentary by Porphyry is evident. There is also, however, an explicit use of material taken directly or indirectly from the lost commentary by Iamblichus, whose work was also drawn upon in the surviving exegesis by Proclus' pupil Simplicius.

Aristotle's *De interpretatione* was regarded in antiquity as an exceptionally opaque work. From a mass of ancient commentaries, the two by Boethius and that of Ammonius of Alexandria are the principal survivors. The work of Porphyry is once again a dominant guide. A substantial part of Boethius' second commentary concerns the tracing of interconnections between an object (*res*), thinking about that object (*intellectus*), talking about it (*vox*) and then putting the spoken thought into writing (*litterae*). The second commentary also discusses a range of questions that had long presented difficulty. For instance, people can have the same general conceptions of justice and goodness; but if they then differ on what in particular is just and good, does that establish moral relativism or merely human fallibility? Aristotle's ninth chapter (the sea-fight tomorrow) provoked a large debate on future contingents and modal logic. In using the terms '*contingens*' and '*contingentia*', Boethius was anticipated by Marius Victorinus. The words were needed for matters which might be other than they are, especially where the chances are even either way.

Boethius shared the Peripetatic aversion to the Stoics' surrender to determinism (see Stoicism). Necessity controls the heavenly bodies; but in this world, human wills are capable of acting after rational deliberation. In Aristotle's vocabulary, 'necessity' is a term to use for what is invariably the case, and therefore not for individual historical events. The debate about determinism, partly paralleled in Alexander of Aphrodisias (in *On Fate*), has a theological bearing, partly because of belief in oracles and prophecy. Do inspired prophets make predictions of future events, or do they foresee trouble coming and, like a physician's prognosis or a weather forecast, utter sage warnings advising on actions to avoid? And if what they foresee is correctly discerned, is it their inspired knowing which in any sense makes the event fated to occur, or can it be said that the gods' knowledge of contingent things is itself contingent? Boethius' second commentary on *De interpretatione* therefore anticipates some of the material in the last book of the *De consolatione philosophiae*, where divine foreknowledge is a sign of future things but not in itself a cause, just as human beings can see what is going to happen without making it occur.

The treatise *De hypotheticis syllogismis* has attracted much attention, in part because of Boethius' awareness of the ambiguity surrounding conditional statements of the form 'If…, then… '. The characteristic account distinguishes hypothetical syllogisms which are affirmative (in the form, 'if A is, B is; if A is not, B is') from those which are negative (in the form, 'if A is, B is not; if A is not, B is not'). The consequent is the decider whether the hypothetical syllogism is affirmative or negative. Porphyry wrote on this subject, and perhaps Boethius made use of his work, which is not extant. The detail with which the subject is treated is significant of the strength of his commitment to the labour of convincing a society in cultural decline of the necessity of logic for clear statement: 'Those who reject logic are bound to make mistakes.' His Greek Neoplatonic masters had already taught him that in this field Aristotle was the supreme guide: '*Aristotelica auctoritas*', he writes in the second commentary on *De interpretatione* (218.26). This could readily be fitted into a Neoplatonic conception of the cosmos or even more readily into a Platonism from which Christian convictions had purged away some of the more mythological elements, such as reincarnation (see Logic, medieval).

4 *Opuscula sacra*

Debate in the Church from about AD 370 had revolved around the correct and adequate way to express (a) that Christ is both divine and human, and therefore combines 'two natures', and (b) that nevertheless Christ is one person and the union of divine and human in him is necessary to his work of redemption. How could the singleness of person be affirmed if a determination to safeguard the reality and spontaneity of Christ's humanity imposed an inextinguishable duality of natures? Boethius was not the first writer to try the use of Porphyry's logical terminology in the attempt to alleviate this formidable conundrum. Cyril of Alexandria, a prominent fifth-century critic of those who held an unmitigated duality of natures, had already employed Porphyrian terms. However, there

was still much defining and clarifying to be done. There remained thorny problems of inconsistency, for example between the meaning of terms expressing the doctrine of the Trinity and the meaning of the same terms of Christology. In both, the words ‘nature’ and ‘hypostasis’ were current, but not always in the same sense in the two contexts. Pietistic fideists who liked to pride themselves on the supernatural faith of Galilean fishermen could look down on the clever logicians who seemed to think Aristotle could better express their religious beliefs. In the West, the stress on the use of papal authority to determine controversies produced a comparable insistence both on submissive adherence to what had been canonically defined by the ecumenical council of Chalcedon (451) and confirmed (after some hesitations) by Pope Leo I, and on resistance to any further explanations or compromises made to placate the Monophysite critics of Chalcedon’s language. However, the logicians saw correctly that the methods and terms of the Neoplatonic commentators on Aristotle could do a little to clarify some obscurities and muddles (see Patristic philosophy).

Augustine (§3) had proclaimed that theologians could not safely neglect dialectic. The fifth tract in Boethius’ *Opuscula*, dedicated to John, a Roman deacon (probably the future Pope John I), was evoked by a critical moment in the debate at Rome with an immediate bearing on East-West relations in the Church and society. The then Pope, Symmachus (498-514), had execrable relations with the Byzantine emperor Anastasius, who found papal insults hard to bear, and with the patriarchs of Constantinople. Probably in 513 a Greek bishop, no doubt in the name of a group of bishops, had written to Symmachus affirming acceptance of Chalcedon’s language and approval of Pope Leo I, but in the qualified formula ‘in two natures *and of* two natures’, and rejecting the dissenting Monophysite formula ‘one nature after the union’. The Greek letter provoked consternation and a storm at Rome in a meeting attended by Boethius and other senators. Reflection on the incapacity of those present to define their terms led him to write the fifth tractate, entitled ‘Against Eutyches and Nestorius’ (Eutyches being for one nature, Nestorius for two, both in extreme and radical forms). The ‘in and of’ formula had been used by Pope Gelasius (492-6), but in 512-13 was unwelcome to the advisers of Pope Symmachus.

It is instructive that Boethius unreservedly welcomed the two prepositions. Close parallels to his language and method appear in Greek writers a few years after his time. Four definitions of ‘nature’ are given:

(a) ‘Nature consists of those things which, since in some way they exist, can be grasped by the mind’. (This language is found in Ammonius’ exegesis of Porphyry’s *Isagōgē*, 2.22.)
(b) ‘Nature is either that which can act or that which can be acted upon’. (Plato, *Phaedrus* 270d; *Sophist* 247d-e; Aristotle, *Topics* VI 10.148a18.)
(c) ‘Nature is the principle of motion *per se* and not as an accident’. (Aristotle, *Physics* II 1.192b20; VIII 4.255a32-; Proclus, *Commentary on Plato’s Timaeus* I 2.20.)
(d) ‘Nature is the specific difference imparting form to each individual thing’. (Aristotle, *Physics* II 1.193a28-31; Alexander of Aphrodisias, *Commentary on Aristotle’s Metaphysics* p.357. 25-.)

A definition of ‘person’ is more difficult. Person is subordinate to nature, as particular to general. ‘Person’ can be used only of a substance, and then only of a being endowed with mind and reason. Christian usage applies the term *persona* to God, human beings and angels. Therefore the definition of person is ‘the individual substance of rational nature’. This is the equivalent of the Greek term *hypostasis*. The Greek *ousia* (being), on the other hand, is used of the universal, with *hypostasis* used of the particular. The main thrust of Boethius’ argument is to show that ‘nature’ and ‘person’ are very distinct terms, and therefore that ‘two natures’ does not imply two persons and ‘one person’ does not imply one nature (in other words, denying the propositions associated with Nestorius and Eutyches, respectively). In connection with the Incarnation, it is impious absurdity to think either that the immutable God can be transformed into humanity or that the reverse is possible (see Incarnation and Christology §1). Change is possible only to entities which share a common substrate of matter (Aristotle, *On Generation and Corruption* 226a10). Nothing corporeal in genus can fall under an incorporeal species. Nevertheless, Boethius concedes a place to some of the language of devotion invoked by the critics of Chalcedon’s ‘two natures’, who wanted to proclaim the worship of the one person of Christ; so, he can say Christ is ‘one of the Trinity’, ‘God suffered’, and therefore it is acceptable to say ‘both in and of two natures’. The effect of Boethius’ argument, (which must have been unwelcome to Pope Symmachus and perhaps to his successor Hormisdas (514-523)), is to justify a middle path between the extremes, defending Chalcedon’s preposition *in*, yet also conceding the *of* designed to reconcile its more moderate critics. Thus, Boethius was advocating a position congenial to a powerful group at Constantinople and anticipating the policies of Justinian, who became Byzantine emperor a year or two

after Boethius' death but who was highly influential before his accession.

The first of the *Opuscula*, 'How the Trinity is one God not three', juxtaposes Catholic orthodoxy with Aristotle's map of ascending human knowledge (*Metaphysics* 1026a18), also set out early in Boethius' first commentary on Porphyry's *Isagōgē*. The study of nature deals with concrete physical entities. Mathematics is a half-way house towards the immaterial abstract realm of theology, where God is form without matter, one substance, indeed Being itself. In God there is no number, no multiplicity; and if 'substance' is a term applied to God, that must imply no substrate to accidents. Following Marius Victorinus, Boethius affirms God, Father, Son and Spirit to be *et ipse et idem* (the same, not identical). The sameness does not exclude differentiation in terms. The ten categories of Aristotle apply only to the realm of sense, not to that of divine forms. God transcends time and space; the everlastingness of the cosmos is other than the eternity of God. The one category which helps the speculative theologian is relation, since 'father' and 'son' are relational terms. The conventional term 'person' is in this context a source of confusion (as Augustine had already said). However, the language about sameness and differentiation within identity found in the *Parmenides* and in Proclus' commentary on it can offer more illumination. Sentences about the contrast between divine eternality and the everlasting temporal duration of the cosmos anticipate the section on the same subject in the *De consolatione* (V pr.6) and are closely related to the propositions in Plotinus III 7.

5 *De consolatione philosophiae*

By using the form of alternate verse and prose, Boethius was able to deploy all his intellectual resources, literary and philosophical. The work takes the form of a dialogue between Boethius, in a prison which is symbolic of his spiritual condition, and a visionary lady who is a personification of Philosophy and addresses her sick patient in discourse designed to give him fortitude in the indignity and injustice that have befallen him. The setting owes a conscious debt to the *Phaedo* of Plato, where Socrates' prison discourse (I pr.3) contrasts the immortality of the soul with the trivialities of life in a mortal material body and enables him to face the death sentence with total serenity. The dank cell and chains are symbolic of Boethius' all too earthbound mind. The lady Philosophy has a robe embroidered with a ladder connecting the initials Ξ and Π (for 'practical' and 'theoretical', or contemplative), and she will lead him upwards on a gradual ascent. The Π is also the letter on his prison dress standing for Thanatos: he is to die. Gradualism is essential to good medical treatment, and she cannot apply all her remedies at once. The verse passages ease the reader's path but are not presented as light entertainment; the Muses of amusement and love (in his youth Boethius wrote some erotic poems) are sharply dismissed. The poetic sections are in content integrated with the prose argument. In the first four books all the verse is uttered by Boethius; from V.3, Philosophy becomes the poetic speaker, adopting this form of address as a concession to his still weak and frail spiritual condition. However, the verses given to Boethius are also an ascent of the soul. At the central hinge-point of the whole work the famous poem *O qui perpetua* ('You who govern the world by perpetual reason… ') versifies the cosmology of Plato's *Timaeus* interpreted with the help of Proclus' commentary on that dialogue (III m.9).

Book I states Boethius' problem; an innocent person is suffering gross injustice. He complains of the way in which, as in the case of Seneca, a brilliantly successful career at the summit of the administration of government has been shattered by treacherous colleagues among his fellow Roman aristocrats and by the cruel tyranny of Theoderic. However, as the work proceeds Boethius himself fades to become a secondary and background figure, while the real exposition is that of Philosophy. She has to remind him of what he has forgotten, namely that power, wealth and honour are secondary matters at best, useful if they enable the possessor to do good to others but otherwise irrelevant to spiritual wisdom.

The second book uses mainly Stoic themes which had already been domesticated with the Neoplatonic scheme of things in writers such as Hierocles and Proclus. The pain of loss is made endurable by a psychological process of adjusting oneself to accept with resignation what cannot be changed. Those in exile must tell themselves that the wretched place to which they have been sent is home to the people who normally live there. To brood nostalgically for a lost past happiness is a peculiarly awful form of misery. Worldly secular honours are precarious and transient, dependent on others and wholly relative to the limited society in which they happen to be held. A holder of high office becomes a nobody beyond the imperial frontier. A philosopher when insulted should remain silent and not answer back. A wise person knows that in death all human beings are equal. Book 2 ends with a poem in

praise of the love which binds together the diverse elements in the cosmos and averts disintegration. Human beings would be happy if only the love by which the stars are ruled could reign in their minds. The poem is a bridge to the third book, which moves from Stoic to Platonic vindications of providence.

The third book, after *O qui perpetua*, seeks to establish the identity of the supreme Good with Good 'than whom nothing better can be thought', employing an Aristotelian argument from the imperfection of every individual good. The ladder of goods, which cannot have an infinite number of steps, has its end in the perfect Good which is also complete happiness. A good person participates in that goodness, which justifies the language of a deification synonymous with salvation. Individual goods give happiness not piecemeal but as a single totality. Boethius sees this principle as pointing to the truth that the supreme good is the One, and from this derives the universal experience of all living things seeking to avert disintegration and to survive by maintaining unity. In the cosmos the forces for disintegration are kept in check by providence; 'whatever holds everything together is what I mean by God' (III 12.25). God is Being itself (*esse*), and evil is a deficiency of being, a nothingness, a privation belonging to an inferiority in the hierarchy of being (see God, concepts of).

The fourth book depends on Plato's *Gorgias* (470-6): the wicked are the most miserable, and punishment benefits them by purification. Goodness is an essential element in true happiness. To the question as to why providence does not reward the virtuous with good and the wicked with evil, the classic Platonic answer is that virtue is the only really good fortune and is its own reward (see Good, theories of the §1). That presupposes some freedom of choice, and that in turn raises the question of providence and fate. From Plotinus onwards, the Neoplatonists held that providence controls the higher celestial order of things, while fate is the inexorable chain of cause and effect in this lower world. Like Proclus, Boethius thinks this fate may be controlled by 'angels' (a term as much as home in pagan Neoplatonists as in Christian writers) or by the world-soul or by the stars. The lower one's position in the great chain of being, the more tightly one is bound by fate. Providence is like the unmoved centre of a great wheel or sphere (a simile also in Plotinus and Proclus). Behind all change is the unmoved mover.

The fifth and last book takes Boethius to higher flights in the discussion of providence (see Providence). He begins from Aristotle's description of chance (*Physics* II 4-5) as an event with a traceable cause, yet an event falling outside the intention of human wills whose purposes are otherwise. As in the unexpected discovery of buried treasure, the action of digging had different intentions but another chain of causation intervened. For the Neoplatonists and for Boethius, such meetings of independent lines of causation are ultimately under the care of divine providence, not of a blind determinism. 'Luck' or 'fortune' is a way of talking about this hidden power of providence to surprise us. But if that were to mean that every event occurs within a closed system of causes, where is there room for determination by free choice and deliberation? Nature does nothing in vain, and human beings are not for nothing endowed with powers of deliberation enabling them to make choices between different options. This is inherent in being a rational being. Admittedly, Boethius does not think all members of the human race possess equal powers of exercising free choice. Moreover, a Platonist who had also read some Augustine, as Boethius demonstrably had, would not think freedom of choice neutral between truth and error, right and wrong; real freedom is to be liberated from the body's downward pull into error and mistaken judgements. So there are degrees of freedom, higher to those who are contemplating the divine mind, lower to those who slide down to the world of physical senses, reaching complete loss of freedom when vice has damaged the power of reason.

Free choice implies that not all events are wholly predictable. Some are contingent; they might turn out otherwise, and that is difficult to reconcile with perfect foreknowledge. At the initial stage of discussion it seems to Boethius more implausible than it appears to the lady Philosophy to hold that human wills do not make their choices because divine foreknowledge has foreseen them and cannot err, but rather that an omniscient divine foreknowledge foresees what choices human beings will make. After all, to know somebody's character intimately is to predict very accurately how they will react to a situation. *A fortiori* this must be true of the divine being who knows all hearts. Nevertheless, if there is contingency in the choices made, divine foreknowledge will, unthinkably, be in error if the choices are taken to be certain when they are inherently uncertain. To maintain that divine foreknowledge, which by definition cannot err, excludes indeterminacy seems to abolish distinctions of moral value between virtue and vice and undermines any sense in either hope or prayer for the avoidance of disaster. (The reference here to prayer does not step outside the conventions of Neoplatonic language, and does not have to be Christian.) The problem, long ago discussed by Cicero in his book on divination, is declared to be one on which Boethius has bestowed much study. The difficulty is alleviated by recalling that to foresee an event is not

causative of its occurrence, that the finite mind is out of its depth when the foreknowledge in question is divine and, crucially, that everything which is known is grasped not according to its inherent nature or power but relative to the capacity of the knowing mind (V 4.25). Foreknowledge of an event is not a sign that an event is absolutely necessary unless there are other causes that bring it about, and to say God knows contingent events to be contingent does not have to mean that because many outcomes are possible even God cannot really know which is will be (see Determinism and indeterminism; Omniscience; Free will).

On fate and destiny, Boethius had probably read the tract by Alexander of Aphrodisias where the correctness of divine foreknowledge is safeguarded by the proposition that the divine knows the contingent to be contingent and this knowing does not make the uncertain certain. Boethius, however, preferred the argument found in Iamblichus and Proclus that divine knowledge is qualitatively quite distinct from human. Events in the temporal process are indeed known to God, but divine knowledge transcends all the successiveness of past, present, and future. Divine knowing is eternal in its mode, and embraces all things and events in simultaneity without the transience inherent in this realm of sense and becoming. To speak of a divine foreknowledge suggests to our finite minds knowing beforehand, in advance. The temporal word ‘before’ is inapplicable in the case of a time-transcending divine perfection. What is before or after for limited minds is an absolute present (but not a frozen instant) for an eternal knower whose duration is paradoxically both infinite and atemporal. Both in his *De trinitate* and in the last section of the *De consolatione philosophiae*, Boethius stresses that eternality is more than mere perpetuity or everlastingness, but is ‘the simultaneous and complete possession of life without limits’ (*Interminabilis vitae tota simul et perfecta possessio*). The definition, as Boethius himself says, derives its force from contrast with temporal and finite life. It is not presented as an original reflection, and in fact closely echoes Plotinus and Augustine (see Eternity).

Aristotle, therefore, was not mistaken to think that the world had no beginning or end (*On the Heavens* I 12.283b 26), but that does not mean it is eternal. The cosmos can be dependent for its existence on the Creator without thereby being transcendent in relation to the temporal process. This created world is not coeternal with the Creator, as Plato observed in the *Timaeus* (37d). Accordingly, God’s knowledge is ‘in the simplicity of his present’ and imposes no necessity on choices and events in time. Moreover, as Aristotle pointed out in the *Physics* (II 9), ‘necessity’ is a term with more than one meaning. There is absolute necessity, for example, that all human beings are mortal, or that the sun rises, and there is also conditional necessity: it is necessary that if a man is walking, then he are walking. For Boethius, the kind of necessity attaching to events in the foreknowledge of God is conditional, not absolute. Certain future events which are to occur by the free choice of human wills and which might occur otherwise are, in divine foreknowledge, conditionally necessary. If you change your mind and intention, you do not empty providence; divine prescience knew that that was what you were going to do. (Augustine in *De civitate Dei (The City of God)* makes the same point: our human wills are included in the causes known to God (V 9)).

6 Influence

Boethius was born into an aristocratic senatorial society concerned to see that the past achievements of Roman culture would not be lost now that the West was controlled by barbarians. He was not the only author to speak the language of Neoplatonism in a way that the medieval world would absorb; that he shared with Calcidius, Martianus Capella, and Macrobius (see Encyclopedists, medieval). Among that company, however, he was distinctive in belonging to a Christian family and in writing influential tractates on controverted theological questions. His masterpiece, *De consolatione philosophiae*, presented the theodicy of Proclus as a flying buttress to a religious statement compatible with Christian belief. This work, taken together with his translations and commentaries, taught the medieval West its first steps in logic and the meaning of inference.

In the ninth century, the Carolingian educational programme gave special prominence to *De consolatione philosophiae* as a medium for the teaching of prose and poetry, and this drew attention to the *Opuscula sacra* as well. The surviving manuscripts of Boethius written in the Carolingian age are reasonably numerous (see Carolingian renaissance). Remigius of Auxerre was first to write a commentary on the tract on the Trinity, the first of the five *Opuscula*. However, it was in the twelfth century that these theological tractates rose to a rank of authority. They also came to stimulate controversy. This was largely because of Gilbert de la Porrée, who became bishop of Poitiers and caused alarm both by his catechetical teaching and his commentaries on four of the *Opuscula* (omitting *De fide catholica*) (see Gilbert of Poitiers). Conservatively minded critics were frightened

when a clever logician began applying Boethian methods of argument to such transcendent subjects as the Trinity and the person of Christ. It made them anxious to be told that without qualification the divine essence is not to be called God, or that it was muddled to say that the divine nature was made flesh and assumed our human nature.

In the same century, Thierry of Chartres more cautiously commented only on the first of the *Opuscula* (*De trinitate*) and on the highly Neoplatonic third which the medievals called *De hebdomadibus*. Clarembald of Arras joined the critics of Gilbert, also commenting on the two tractates chosen by Thierry. The consequence of these debates, in which Thomas Aquinas was to participate in the next century, was to insert into the consciousness of the Latin West a sharper awareness of some problems inherent in the logic of traditional Christian language about God, and at the same time to arouse among the less dialectical faithful a sense of disapprobation of theologians who knew more about Boethius than about the apostles.

HENRY CHADWICK

List of works

Boethius, A.M.S. (*c*.480-525/6) translations of Aristotle, ed. L. Minio-Paluello, *Aristotles Latinus*, vols I-VI (vol. VI ed. B. Dod), Bruges: Desclée de Brouwer, 1966-75.(Collected editions of Boethius' translations of Aristotle's works.)

Boethius, A.M.S. (*c*.480-525/6) *In Isagogen Porphyrii commenta (Commentaries on Porphyry's Isagōgē)*, ed. S. Brandt, Corpus Scriptorum Ecclesiasticorum Latinorum 48, Vienna: Tempsky, 1906.(Includes the commentaries based on the translation by Marius Victorinus and that of Boethius himself.)

Boethius, A.M.S. (*c*.480-525/6) Commentary on Aristotle's *Categories*, in J.-P. Migne (ed.) *Patrologia Latina*, vol. 64, Paris, 1860.(Boethius' commentary uses the translation of Marius Victorinus as its base; he also produced his own translation.)

Boethius, A.M.S. (*c*.480-525/6) Two Commentaries on Aristotle's *De interpretatione*, ed. R. Meiser, *Anicii Manlii Severini Boetii in librum Aristotelis Peri hermeneias*, Leipzig: Teubner, 1877-80, 2 vols.(One commentary is full-length, the other is shorter and simpler.)

Boethius, A.M.S. (*c*.480-525/6) Notes on *Prior Analytics*, in L. Minio-Paluello (ed.) *Aristoteles Latinus*, vol. III, Bruges: Desclée de Brouwer, 1965.(Notes which accompanied Boethius' translation of the *Prior Analytics*.)

Boethius, A.M.S. (*c*.480-525/6) *In Ciceronis Topica (Commentary on Cicero's Topics)*, in J.C. Orelli and J.G. Baiter (eds) *Ciceronis Opera*, Vol. V, part 1, Zurich: Fuesslini, 1833; trans. E. Stump, *Boethius's In Ciceronis Topica*, Ithaca, NY: Cornell University Press, 1988.(This commentary has been transmitted incomplete.)

Boethius, A.M.S. (*c*.480-525/6) *De hypotheticis syllogismis (On Hypothetical Syllogisms)*, ed. L. Obertello, Brescia: Paideia, 1969.(A Greek paraphrase by Maximos Holobolos (*fl.* 1261-80) is edited by D.Z. Nikitas in *Eine byzantinische Übersetzung von Boethius' 'De hypotheticis syllogismis'*, Göttingen: Vandenhoeck & Rupprecht, 1982.)

Boethius, A.M.S. (*c*.480-525/6) *De divisione (On Division)*, in J.-P. Migne (ed.), *Patrologia Latina*, vol. 64, Paris, 1860; trans. E. Stump and N. Kretzmann in *The Cambridge Translations of Medieval Philosophical Texts* I, Cambridge: Cambridge University Press, 1988.(On the classification of ideas.)

Boethius, A.M.S. (*c*.480-525/6) *De syllogismo categorico (On Categorical Syllogism)*, in J.-P. Migne (ed.) *Patrologia Latina*, vol. 64, Paris, 1860.(Expounds on the *Prior Analytics*.)

Boethius, A.M.S. (*c*.480-525/6) *Introductio ad syllogismos categoricos (Introduction to Categorical Syllogisms)*, in J.-P. Migne (ed.) *Patrologia Latina*, vol. 64, Paris, 1860.(Shorter work on categorical syllogisms.)

Boethius, A.M.S. (*c*.480-525/6) *De topicis differentiis (On Topical Differences)*, in J.-P. Migne (ed.) *Patrologia Latina*, vol. 64, Paris, 1860; trans. E. Stump, *Boethius's De topicis differentiis*, Ithaca, NY: Cornell University Press, 1978.(Boethius' own writings on topical differences.)

Boethius, A.M.S. (*c*.480-525/6) *Opuscula sacra (Theological Tractates)*, ed. and trans. H.F. Stewart, E.K. Rand and S.J. Tester, *Boethius: Theological Tractates, Consolation of Philosophy*, Cambridge, MA: Harvard University Press, 1973; ed. and trans. M. Elsässer, *Die Theologischen Traktate*, Hamburg: Felix Meiner, 1988; trans. H. Merle, *Court traités de theologie*, Paris: Éditions du Cerf, 1991.(Elsässer's German translation has good notes. Merle's French translation is annotated, without the Latin text.)

Boethius, A.M.S. (*c*.480-525/6) *De consolatione philosophiae (The Consolation of Philosophy)*, ed. and trans. H.F. Stewart, E.K. Rand and S.J. Tester, *Boethius: Theological Tractates, Consolation of Philosophy*, Cambridge, MA: Harvard University Press, 1973; ed. L. Bieler, Corpus Christianorum, Series Latina 94,

Turnhout: Brepols, 1957; ed. J.J. O'Donnell, *Boethius Consolatio Philosophiae*, Bryn Mawr Latin Commentaries, Bryn Mawr, PA: Bryn Mawr College, 1984.(Part of Books IV and V are edited with English translation and good commentary by R.W. Sharples in *Cicero: On Fate (De Fato) & Boethius: The Consolation of Philosophy (Philosophiae consolationis) IV 5-7, V*, Warminster: Aris & Phillips, 1991. For an English translation only, see V.E. Watts, *The Consolation of Philosophy*, Baltimore, MD: Penguin, 1969.)

Boethius, A.M.S. (*c*.480-525/6) Introductions to *Arithmetic* and *Music*, ed. G. Friedlein, *De institutione arithmetica libri duo, De institutione musica libri quinque*, Leipzig: Teubner, 1867.(Boethius' works are adaptations of earlier works by Nicomachus of Geras; see §2.)

Bogdanov, Aleksandr Aleksandrovich (1873-1928)

Aleksandr Aleksandrovich Bogdanov, né Malinovskii, was a Russian thinker who helped Lenin create the Bolshevik or Communist Party, broke with Lenin over a mixture of philosophical and political issues, yet would not quit the Revolution. His life and thought illuminate the interaction of philosophy and politics within the tumultuous context of a 'developing' country, which calls in question political philosophies that take for granted the conditions of 'developed' countries.

Bogdanov never won such widespread interest as those dissident communists - Georg Lukács, most notably - who turned Marxism away from claims of science towards theories of consciousness and wilful action. Bogdanov sought a positivist basis for his philosophy of action or practice. He offered 'empiriomonism' and 'organizational science' to creators of a 'free collectivism', but the creators of the Soviet system brushed him aside. He has been studied by scholars who wonder why the Russian Revolution - or twentieth-century revolutions in many developing countries - have failed to realize dreams of justice and freedom, and by a different cluster of scholars who conceive of a metascience that might unify the fragmented world of knowledge. Less known is Bogdanov's sense of tragic contradictions in revolutionary pragmatism, as we may call active belief in Marx's famous declaration that the point of philosophizing is not merely to interpret the world but to change it.

1 Life and thought

'Spiteful stupid administrators', who ran a provincial boarding school as a 'barracks, a jailhouse', taught young Bogdanov to 'fear and hate those who rule, to reject authorities', he reports in his 'Avtobiografiia' (Autobiography) (1926). Pragmatism - in the mundane sense of adapting to things as they are - must have tempered his fearful hatred, for he won a gold medal from those administrators, and then a degree in natural science at Moscow University, though revolutionary activity caused his student career to be interrupted by arrest and banishment from the capital. He also earned a medical degree, and intermittently worked as a physician for the rest of his life. Constant involvement in revolutionary propaganda brought repeated periods in jail and banishment, which gave him leisure to study and write. At the outset he was a populist of the 'People's Will' persuasion, believing in heroic action as the way to a just and prosperous Russia, but he soon turned to the Marxist or positivist belief that science reveals the way forward. He began a lifelong outpouring of publications with *Kratkii kurs ekonomicheskoi nauki (A Short Course of Economic Science)* (1897), which won high praise from the young Lenin and became a widely used textbook in Marxist circles.

Acting as a propagandist among provincial workers, Bogdanov discovered their need for a worldview, and responded with *Osnovnye elementy istoricheskogo vzgliada na prirodu (Basic Elements of the Historical View of Nature)* (1899). The most basic 'element' in this view was energy, Ostwald's substitute for the matter-and-force of mechanical or vulgar materialism. This book also won the admiration of Lenin, who failed to perceive the difference from the materialism, dialectical and historical, which he admired in the works of Plekhanov, 'the father of Russian Marxism'. By the time that Lenin learned the difference - talking with Plekhanov in Swiss exile - Bogdanov and he had become leaders of the emergent Bolshevik faction within the Russian Social Democratic Party. Though Plekhanov was a major figure in the rival Menshevik faction, Lenin still considered him the greatest teacher of orthodox Marxist philosophy. Bogdanov sneered at such orthodoxy as a fetish, not the philosophy of science that it claimed to be. That he found in a wide array of thinkers, including Nietzsche, and especially Mach, whose empiriocriticism he refashioned as empiriomonism, to unify all types of knowledge and action (see Russian empiriocriticism §2).

This disarray in political and philosophical commitments did not prevent Lenin and Bogdanov from joint action through the first Russian revolution in 1905-6. Their Bolshevik faction pressed the Russian Social Democratic Party towards more aggressive policies than the Mensheviks favoured, and thereby pushed towards a formal split into separate parties. When the Tsar's government had succeeded in putting down the first Russian Revolution, and Russian Marxists retreated from the politics of mass action to the quarrels of underground cells and exile circles, Lenin wrote *Materializm i ėmpiriokrititsizm (Materialism and Empiriocriticism)* (1909). It was a vituperative attack on Bogdanov and the other Marxists who had been drawing on Mach to remedy the movement's lack of proper philosophical grounding. Bogdanov responded with a counterattack on Lenin, *Padenie*

velikogo fetishizma; Vera i nauka (The Fall of a Great Fetishism; Faith and Science) (1910), as he had earlier responded to Menshevik attacks with *Prikliucheniia odnoi filosofskoi shkoly (The Adventures of a Philosophical School)* (1908a). Efforts to draw German notables into these disputes provoked illuminating refusals. In a private letter Mach declared his 'social democratic' sympathies to be separate from the philosophizing that he did in public, while Kautsky, the chief theorist of German Marxism, saw things the other way round: not politics but philosophy was a matter of individual taste - separate from the 'public sphere', he might have said, had he known a buzzword that German Marxism would generate later on.

One common way to sort out political from philosophical issues in the polemics of Russian Marxists is to blame Lenin's fanaticism for entangling two realms of discourse that would otherwise have been as civilly separated in Russia as in the West. This interpretation ignores the pattern of entanglement that preceded Lenin's outburst, and caused it. Empiriocriticism was linked with Bolshevik theorists, materialist orthodoxy with Mensheviks, and the correlation seemed logical. To ground Marxism in historical materialism, pointing to long-term social processes that determine human thought and action, seemed to support the go-slow politics of the Mensheviks, while emphasis on the active role of collective mentalities in ordering experience seemed to favour the urgent push to revolt that the Bolsheviks advocated. That scheme, presented to Western comrades by Bogdanov's article, 'Ernst Mach und die Revolution' (Ernst Mach and the Revolution) (1908b), in the major journal of German Social Democracy, was becoming conventional wisdom in Marxist circles. Lenin's outburst was designed to prove that his party was *not* revisionist but orthodox, as all true Marxists must be.

At a showdown meeting of Bolshevik leaders in 1909 Bogdanov and Lunacharskii mocked the push to establish a party line in philosophy. Lenin denied that he was doing any such thing, while pressing for expulsion of the unorthodox. Bogdanov tried to gain acknowledgement of the inconsistency, in vain. He was expelled from the Bolshevik organization, and intensified his warning against 'fetishism' - formulaic idolatry in place of creative theory - and against 'vampirism' - the desiccation of revolutionary thought by worship of formulas. His polemics against Lenin and Plekhanov declared them to be victims of 'the Vampire', which appeared in a novel of Bogdanov's as a hectoring monster within the revolutionary hero's mind, in a melodramatic imitation of the Devil appearing to Ivan Karamazov.

'Dilettantism' was Trotsky's diagnostic label for superficial pretensions of unifying knowledge and action, when knowledge is actually fragmented in professional disciplines apart from the Marxists' realm of political action. Trotsky himself was hardly immune. He wrote on almost as many topics as Bogdanov, from a supposedly Marxist viewpoint, and accepted an invitation to lecture at a school for revolutionaries that Bogdanov's group established on Capri, where the famous writer Gor'kii provided a haven. Bogdanov soon found there the same 'authoritarianism' that he opposed in the party high command. In a letter of resignation he noted his lifelong struggle 'against two enemies, authoritarianism and individualism, and the former is the more hateful to me'. By 1911 he announced his withdrawal from politics altogether, in favour of 'cultural' and 'scientific' work. He meant separation from any political party; his understanding of culture was thoroughly politicized in the broad sense of both terms.

2 Life and thought (cont.)

Brooding over the revolutionary passions of the lower classes, which promised imminent overthrow of the existing system, while their cultural backwardness portended their inability to use power effectively, Bogdanov began preaching the need to develop 'proletarian culture'. He was thinking by analogy with the flowering of bourgeois culture *before* the French Revolution brought the bourgeoisie to power. Lenin expressed a more wilful belief in practice as the criterion of truth. He asked why the Party might not mobilize lower-class anger to overthrow the rule of landlords and capitalists, and *then* have the 'cultural revolution' that would enable any cook to manage public affairs. Both men perceived the lower-class nature of the imminent revolution, and both took it for granted that a vanguard party must guide the masses, but Bogdanov was concerned to foster a 'free collectivism' at every level. Hence his paradoxical efforts to combine a sceptical epistemology with a totalizing worldview.

That dream was central both to his philosophy of 'empiriomonism' and to his 'organizational science' or 'tektology'. He emphasized the philosophy in publications of 1903-9, the science afterward, as he 'moved to a decisive recognition of "the decline of philosophy", of transition to construction of a purely scientific monism' ([1913] 1923: 328). The 'purely scientific monism', expounded in three volumes of *Tektologiia: Vseobshchaia*

organizatsionnaia nauka (Tektology: The Universal Organizational Science), (1913-25), drew its title from Haeckel, and its central thesis from Le Chatelier. Assuming 'equilibrium' to be inherent in all systems, mental and social as well as biological and mechanical, Bogdanov offered rules of 'organization' that could serve for scientific management in all spheres.

In 1917 mass revolt broke up the tsarist system and opened the way for Lenin's establishment of a Soviet state ruled by the Communist Party. The quarrels of émigré intellectuals shrank in significance and dissidents rejoined the Party to serve the victorious revolution, but Bogdanov declined to do so. He published gloomy criticisms of Lenin's policies in 1917-18, which he never retracted, though he stayed in Russia to help the cause. In a letter to Lunacharskii, declining the offer of a post in the Commissariat of Enlightenment, Bogdanov explained why he could neither join the new regime nor work against it. He found a repulsive distortion of socialism 'in the often absurd but almost always *compulsory* things that are done in your regime. I not only see, but think that *you* see the tragic quality [*tragizm*] of your situation' (1990: 352; original emphases). He summed up the tragedy with an aphorism - 'A situation is often stronger than logic' (1990: 355) - which implicitly challenged his lifelong faith in pragmatic reason fused with collective action, but he left the implication unexamined. He simply chose to stay in 'the wearisome isolation of a sighted person among the blind', doing 'cultural and scholarly' preparation for revival of a genuinely socialist party. One may call that a tragic version of revolutionary pragmatism, with only a trace of the usual reassurance that present defeat must surely turn into future triumph since scientific revolutionaries know what the future must bring. Bogdanov's philosophizing about knowing and acting usually emphasized some version of that reassurance - most melodramatically through the mouth of a novelistic heroine: 'In order to wage the struggle one must know the future', which Bogdanov's *Krasnaia zvezda (Red Star)* (1908) laid out in utopian detail. But he could also express dark suggestions that the struggle for justice and freedom may be a losing gamble.

For a time, 1918-20, he was a leader of 'Proletarian Culture' or Proletcult - a network of study circles, art studios and theatre companies, bringing traditional knowledge and skills to the masses while also developing their capacities to overcome the hegemony of bourgeois culture. Lenin was initially sympathetic, but he insisted that the movement must accept subordination to the new regime. Proletcult refused, and was shut down. Bogdanov thereafter confined his activities to the newly established Communist Academy, which published his works in philosophy and social science, and to experiments in blood transfusion at a new institute directed by himself. An official campaign against his philosophy during the drive to suppress Proletcult had put 'Bogdanovism' out of bounds for Soviet Marxists even in the relatively free 1920s. Logically, his views should have been central to the debate between neo-Hegelian and neo-positivist interpretations of Marxist philosophy, but the neo-positivists' affinity with an outright critic of Lenin had become a political smear, to be hurled or dodged without serious discussion of the critic's arguments. Thus his warnings against philosophy desiccated by idolatry fell against a wall of silence, erected by an ideological bureaucracy seeking formulas for a confessional Marxism.

The most poignant irony of this situation was the pragmatism that all these Marxists shared but could not openly acknowledge or freely debate. They all agreed that practice is the criterion of truth, that the way forward is through collective action based on 'the lessons of practice'. As the ideological establishment read the lessons, an obvious inference emerged: since Lenin was the supremely practical leader of the successful revolution, he must also be considered the supreme philosopher. The next step, the extension of that pragmatic logic to Stalin worship, would be taken in 1929-30, but Bogdanov did not live to see it. In 1928 he submitted his body to an exchange of all its blood for that of a man suffering from malaria and consumption, and died. No direct evidence of suicidal intent has come to light, though one notes that suicide was a debatable issue, not a taboo, in Bogdanov's philosophizing. The official eulogies described his experiment as heroic self-sacrifice for the advancement of science, but that did not rescue his philosophy from the limbo of enemy doctrines, recalled only to be reviled.

3 Reception and significance

Khrushchev's reforms of the 1950s and early 1960s revived a vision of socialism as a freely self-regulating system, but the most practical visionaries drew on mathematical economics rather than Bogdanov's legacy. Memory of Bogdanov's tektology, as a precursor of cybernetics and systems theory, cropped up in talk of improving the Soviet system by a 'scientific technological revolution' - fuzzy talk that served to evade serious engagement with the mounting problems of a command economy and an ideology that stifled thought. Bogdanov's

mockery of 'fetishism' and 'vampirism', and his insistence on free collectivism, were not recalled until the late 1980s, during Gorbachev's push for 'openness' in thought and 'restructuring' in social organization. But that push turned so quickly into systemic collapse, with total revulsion against Marxist thought in any form, that Bogdanov's period of respect in his native land was very brief. Whether Russian thinkers will ever have a sustained revival of interest in his thought depends still, as it has all along, on the stand they take between extremes of total revulsion and total passivity, between wild attempts to leap out of the system they are born into and fatalistic adaptation to it. If they attempt careful thought about ways to make effective use of their historic experience, the part that Bogdanov played will take on a new significance.

It seems unlikely that Bogdanov's thought ever will be considered of major significance apart from the life that gave it meaning within the Russian revolution. Few of his works have been translated into Western languages, though some historians and some believers in systems theory have called attention to him. Tektology may be 'a kind of metascience' (Gorelik 1980), comparable to Wiener's cybernetics or Bertalanffy's general system theory, but it has attracted less interest. The most searching studies of Bogdanov's thought have set it in an historical context that it does not transcend. Such studies emphasize either the logical inconsistencies of his efforts to combine epistemological scepticism with a monistic faith (see Kolakowski 1978), or the derivative quality of his popularized knowledge and overabundant theorizing (see Grille 1966), or the utopian faith that he struggled to keep creatively alive while the victorious revolutionaries were turning utopia into ritualized worship of a dream deferred (see Sochor 1988). Sympathy abounds, but it does not save the thought. Sochor dwells on Bogdanov's creative utopianism as evidence that the Russian Revolution might have developed less tyrannically than it actually did, and Grille pictures Bogdanov as a 'red Hamlet', whose balancing between the demands of action and of thought reflects honour on him. Both authors, and Kolakowski even more, avoid the hardest philosophical question posed by the history of political thought and action in Third World countries. They fail to ask whether practice as the criterion of truth in Russia - or China, or Angola, or Iran - is compatible with pragmatism as a philosophy of comfortable thinkers in advanced countries.

Bohr, Niels (1885-1962)

One of the most influential scientists of the twentieth century, the Danish physicist Niels Bohr founded atomic quantum theory and the Copenhagen interpretation of quantum physics. This radical interpretation renounced the possibility of a unified, observer-independent, deterministic description in the microdomain. Bohr's principle of complementarity - the heart of the Copenhagen philosophy - implies that quantum phenomena can only be described by pairs of partial, mutually exclusive, or 'complementary' perspectives. Though simultaneously inapplicable, both perspectives are necessary for the exhaustive description of phenomena. Bohr aspired to generalize complementarity into all fields of knowledge, maintaining that new epistemological insights are obtained by adjoining contrary, seemingly incompatible, viewpoints.

Bohr's elaborations of complementarity can be divided into two distinct periods marked by the challenge of the Einstein-Podolsky-Rosen (EPR) paper in 1935 (see Einstein, A. §5). The first period explores the compatibility of the quantum formalism with experiments through Heisenberg's uncertainty principle, which implies that in the quantum domain spacetime and energy-momentum (or causal) descriptions are not simultaneously applicable (see Heisenberg, W.). In Bohr's terminology, spacetime and causality are complementary. Similar complementarity relations hold between wave and particle attributes of atomic objects, which are exhibited in mutually exclusive experimental arrangements.

Bohr's initial formulations of complementarity relied on the idea of an 'uncontrollable' physical disturbance of the microscopic object by the measuring device, due to the 'indivisibility' of the quantum of action and necessitating the 'inseparability' of atomic phenomena from their means of observation. This disturbance is the source of the 'final renunciation' of causality and objective reality in the atomic domain. According to Bohr, realistic causal descriptions presuppose the possibility of the definition of a system's state, excluding in principle all disturbances.

The EPR paper undercut Bohr's notion of disturbance. Einstein and his co-workers devised a thought experiment where for two previously interacting particles one is free to predict either the position or the momentum of the first particle on the basis of observations made on the spatially separated second particle. Since the measurement on the second particle cannot immediately 'disturb' the state of the first one, they concluded that both position and momentum can be attributed to the first particle simultaneously, contrary to the uncertainty, complementarity and 'completeness' of the quantum theory.

Bohr countered this challenge by resorting to operational and relational definitions of concepts, replacing his idea of physical disturbance by a 'semantic' one. In the EPR experiment, measuring the position of the first particle precludes the prediction, or meaningful assignment, of momentum to the second one. Scientific concepts are to be defined only relative to the 'whole' experimental arrangement. After EPR, such positivistic statements are frequent in Bohr's writings.

The central claim of Bohr's philosophy after EPR is the indispensability of classical concepts, supplemented by ordinary language, for unambiguous communication of experimental results. Unambiguous description presupposes a strict separation between the observed object and the observing subject. This is possible only at the classical level, where the quantum of action can be neglected. Classical concepts, guided by complementarity in different experimental arrangements, are therefore the fundamental descriptive concepts in the quantum domain. There are no 'quantum concepts' and no 'quantum reality', only an abstract formalism for the calculation and prediction of measurement results. Progress in science consists in 'rational generalizations' of the old frameworks, not in their replacement by genuinely new conceptual schemes. This claim, placing a priori limits on scientific theorizing, was contested by Bohr's opponents and sympathizers alike.

Bohr's doctrine of the indispensability of classical concepts is rooted in his correspondence principle, which, by relying on classical analogies, guided the search for a consistent quantum theory before its creation in 1925. Yet the difference between correspondence and complementarity is striking. The former was a heuristic principle leading to many new discoveries, culminating in Heisenberg's quantum formalism. The latter had no new empirical import, being aimed at the philosophical legitimization of the quantum theory.

Bohr supports his view that the classical realm is privileged by arguments stressing direct accessibility of classical reality to immediate sense perception. These arguments, together with Bohr's preoccupation with the conditions and limits of the applicability of concepts, have strong Kantian roots. In this respect there is a substantial similarity between Bohr and the philosophy of his teacher, the Neo-Kantian philosopher Harald Høffding.

In his later years, Bohr aspired to extend the 'epistemological lesson' of complementarity to biology, psychology and anthropology, maintaining that in these fields, as in quantum physics, observational interaction can be neither neglected nor precisely determined. These generalizations are rarely developed, by Bohr or others, into more than suggestive analogies.

The value of Bohr's philosophy for the advancement of physics is controversial. His followers consider complementarity a profound insight into the nature of the quantum realm. Others consider complementarity an illuminating but superfluous addendum to quantum theory. More severe is the opinion that Bohr's philosophy is an obscure 'web of words' and mute on crucial foundational issues.

Opinions are also divided about the status of Bohr's philosophy after Bell's results (see Bell's theorem). Some scholars consider Bell's proof that rules out local deterministic realistic theories a vindication of Bohr's philosophy of indeterminism and inseparability. Others hold that Bohr's positivistic prohibitions are irrelevant to the contemporary quest for an adequate quantum ontology. Once a ruling 'dogma', Bohr's philosophy is no longer considered the final word about the nature of the quantum world.

Bold, Samuel (1649-1737)

Samuel Bold (or Bolde) was a Latitudinarian minister who defended John Locke's Reasonableness of Christianity and his Essay Concerning Human Understanding. Bold published a series of pamphlets and short books which argued a theological position substantially identical to that of Locke. He also mounted a philosophical defence of Locke's definition of knowledge and his supposition that it was possible that God could, if he so wished, superadd to matter the power of thought. In a book on the theological issue of the resurrection of the same body he defended Locke's account of personal identity.

Samuel Bold entered English public controversy in his Dorset ministries with a published sermon in defence of moderation for dissenters, followed by other controversial publications, including pamphlets in the late 1690s supporting Locke's *Reasonableness of Christianity* (Bold later surmised that Locke was the author of this anonymous work) (see Locke, J. §§1, 7). He was also much impressed with Locke's *Essay Concerning Human Understanding* and, when this was attacked by John Edwards, he defended it in a further pamphlet, *Some Considerations on the Principal Objections and Arguments Which have been Publish'd against Mr Lock's Essay of Humane Understanding* (1699).

Bold's defence of Locke was centred on two issues: Locke's definition of knowledge and his conjecture that God could add to matter a power of thinking, issues which were also central in Locke's controversy with Stillingfleet. On the first of these, Locke had defined knowledge in terms of seeing an agreement or disagreement between ideas. As Bold explained it, propositions are known to be true 'by perceiving that the Ideas, signified by the words of which the proposition doth consist, have such a connection or agreement, repugnancy, or disagreement, as the Proposition doth express' (1699: 6). He claimed that Locke was correct in holding that there was no way to truth except via ideas. He underlined that this was no threat to the Christian religion as long as we clearly distinguished knowledge (which is certain) from faith on evidence (which, although reasonable, is not).

With regard to the possibility of thinking matter Bold fully appreciated what Locke's detractors generally did not, that Locke's claim was an epistemic one: *for all we know* God might add the power of thinking to matter (because there was no inconsistency between the ideas of matter and thinking). It was not a disguised attempt to argue for the truth of the claim. As such, Bold held, it could not be faulted. The power of thinking could in principle be added by God to any substance, mental or physical, for we cannot understand in either case how that power actually produces its effect. All we know is that it does.

Bold shows himself to be an able, if unoriginal, philosopher. His next work, the book *A Discourse Concerning the Resurrection of the Same Body* (1705), is again a defence of Locke's philosophy, this time focusing on his account of personal identity and its implications for theology, especially as it relates to the necessary articles of the Christian faith. Although Bold's argument does not advance beyond Locke's position, it brings out clearly the close relationship between the epistemic issues which Locke raises and contemporary Christian theology. This is further confirmed by the subsequent section of the work, separately titled *A Discourse concerning the Immateriality of the Soul*, in which once again it is Locke's epistemology that is defended.

Bold is rarely more than a clear-headed commentator on Locke, but he is undoubtedly a superior philosopher to many of those who sought to attack the *Essay Concerning Human Understanding* for its supposedly unacceptable theological implications.

Bolzano, Bernard (1781-1848)

Bernard Bolzano was a lone forerunner both of analytical philosophy and phenomenology. Born in Prague in the year when Kant's first Critique appeared, he became one of the most acute critics both of Kant and of German Idealism. He died in Prague in the same year in whichFrege was born; Frege is philosophically closer to him than any other thinker of the nineteenth or twentieth century. Bolzano was the only outstanding proponent of utilitarianism among German-speaking philosophers, and was a creative mathematician whose name is duly remembered in the annals of this discipline. His Wissenschaftslehre (Theory of Science) of 1837 makes him the greatest logician in the period betweenLeibniz and Frege. The book was sadly neglected by Bolzano's contemporaries, but rediscovered by Brentano's pupils: Its ontology of propositions and ideas provided Husserl with much of his ammunition in his fight against psychologism and in support of phenomenology, and throughTwardowski it also had an impact on the development of logical semantics in the Lwów-Warsaw School.

1 Life and main works

Bolzano was son of a German mother and an Italian father. As a young man he became keenly interested in the foundations of mathematics (his first mathematical paper appeared in 1804), yet he decided to study theology. In his native city, Prague, he graduated with a Ph.D. and was ordained a priest in 1805. In the same year he was appointed professor of the philosophy of religion to a newly-founded chair at the Charles-Ferdinand University. Nevertheless his first book was *Beyträge zu einer begründeteren Darstellung der Mathematik (Contributions to a More Well-founded Presentation of Mathematics)* (1810) in which he attackedKant's views on geometry and arithmetic. Bolzano's university lectures are preserved in his monumental *Lehrbuch der Religionswissenschaft (Textbook of the Science of Religion)* (1834). His philosophy of religion is based on his ethics. He criticizes Kant's categorical imperative and his doctrine of postulates, and advocates a version of utilitarianism. Bolzano's logical notion of a manifold (*Inbegriff*) is the conceptual core of his version of a cosmological argument for the existence of God (see God, arguments for the existence of §1). Only the conclusion of this argument is the possible content of a religious belief. Bolzano maintains that a religious belief is, or strengthens the motivational power of, a moral belief. He takes beliefs to be indirectly under the control of our will and presents a lucid account of self-deception. Someone's religious belief may be due to self-deception, he argues, and yet the steps taken to acquire it may be justifiable by utilitarian principles. Taking divine revelation to be an attempt at communicating, he gives a very subtle analysis of this concept. He rejects the Humean definition of a miracle and tries to defend the possibility of miracles with the help of his theory of probability.

Owing to his public lectures, many of which are collected in his *Erbauungsreden (Sermons)* (1813, 1849-52), Bolzano became the protagonist of the 'Bohemian Enlightenment'. He pleaded for social reforms, attacked militarism and strongly criticized both the discrimination against Czech Bohemians by their German compatriots and the anti-Semitism on both sides. The Austrian Emperor Francis was infuriated by much of this and dismissedBolzano from his chair in 1820.

Bolzano withdrew to a small village in southern Bohemia where he composed some of his most important works. His metaphysical treatise *Athanasia (Immortality)* (1827) is inspired byLeibniz's *Monadology*. The four volumes of his *Theory of Science* contain a highly original (philosophy of) logic (vols 1-2), an empiricist epistemology and a theory of scientific discovery (vol. 3), and a methodology for writing useful textbooks (vol. 4). His *Größenlehre (Theory of Magnitudes)* comprising *Zahlenlehre (Theory of Numbers)*, *Functionenlehre (Theory of Functions)* and *Raumwissenschaft (Theory of Space)* remained unfinished (and will eventually be published in the complete edition of his works (1969-)). Bolzano spent the last seven years of his life back in Prague, where he frequently delivered papers (mainly on aesthetics and mathematics) to the Bohemian Academy of the Sciences. Among his most outstanding mathematical contributions are the following: he defined convergence and indicated convergence criteria (several years before Cauchy), and described a function continuous but not differentiable in an interval (several decades before Weierstrass). He realized that any infinite set contains a subset that stands in bi-univocal correspondence to it, and he realized that this is not a contradiction. This is a central topic in his *Paradoxien des Unendlichen (Paradoxes of the Infinite)* (1851). Cantor thought very highly of this book, and Peirce praised its author as conferring 'a singular benefit upon humanity' (1909).

2 Basic ontological categories

Bolzano's universe is a universe of objects (*Gegenstände*). Objects are either actual (*wirklich*, effectual) or non-actual. Something is actual if and only if it is an element of the causal order. (Bolzano outlines his ontology of actual objects at the beginning of his *Athanasia*.) Actual objects are either substances or adherences. An object is an 'adherence' if and only if it is actual and a feature of another actual object on whose existence and identity it depends. (Your last headache would be an example.) An object is a 'substance' if and only if it is actual and not an adherence. (Sometimes Bolzano takes substances to be non-composite as well.) Some adherences are mental: volitions, wishes, sensations and, most importantly for the *Theory of Science*, subjective ideas (*subjektive Vorstellungen*) and acts of judgment (*Urteile*). Properties as shareable by many objects are non-actual objects, and so are numbers. Seen against the background of earlier metaphysics *Sätze an sich* ('sentences-as-such': henceforth, 'propositions') and their constituents are the most remarkable non-actual objects in Bolzano's ontology as developed in his *Theory of Science*. In his use of '*Satz*' Bolzano can appeal to one prominent use of this term in German. A definite description such as '*der Satz des Pythagoras*' (Pythagoras' theorem) refers to something purportedly discovered by a Greek philosopher-mathematician which can be expressed by many sentences in many languages. In Bolzano's usage, the epithet '*an sich*' amounts to something like the gloss 'in the strict sense of this term'.

Propositions are not true or false in a language or in a context, but simply true or false, full-stop. They differ from true or false utterances or judgments in that they are non-actual. Thus something is a proposition if and only if it is both *simpliciter* true or false and non-actual. An utterance is true if and only if the proposition expressed by it is true. The proposition expressed by an utterance is the sense (*Sinn*) of this utterance. Bolzanian sense is not to be identified with the linguistic meaning of the sentence uttered. (Sentences with the same linguistic meaning might be used to express different propositions: your utterance of 'I have blood-type A' might express a true proposition, while my utterance of '*Ich habe Blutgruppe A*' expresses a false one.) Propositions also play a psychological role in being the potential contents (*Stoff* (matter)) of judgments. A judgment is true if and only if the proposition which is its content is true. Propositions are composite, structured entities. *P* is the same proposition as *Q* if and only if *P* is built in the same way from the same components as *Q*.

A component of a proposition which is not itself a proposition is a *Vorstellung an sich* ('idea-as-such': henceforth, 'idea'). The idea expressed by a non-sentential component of a sentential utterance is the sense of this component. (Not all words in an utterance express ideas: the phrase 'really sad' expresses the same idea as 'sad'. Not all ideas which are components of the proposition expressed by an utterance are expressed by components of the utterance: if you now say, 'It is snowing', the proposition expressed must contain an idea which represents a place, otherwise it would not be *simpliciter* true or false.) One and the same idea can be the content of many subjective ideas, that is, of many non-judgmental components of judgments. An idea is objectual (*gegenständlich*) if and only if there is at least one object to which it refers. An idea which refers to exactly one object and is not composed of other ideas is an 'intuition' (*Anschauung an sich*). An intuition is expressed by an indexical use of 'this'. An idea which neither is nor contains an intuition is a pure 'concept' (*reiner Begriff*). Equivalent ideas (*Wechselvorstellungen*) are objectual ideas which refer to the same objects. Bolzanian ideas are very fine-grained: 'trilateral' and 'triangular', for example, in spite of being analytically coextensive, do not express the same idea.

3 Truth and degrees of validity

A proposition *P* attributing property *y* to object *x* is true, Bolzano explains, if and only if *x* has *y*. Here '*P* attributes *y* to *x*' is meant to characterize not a linguistic or mental activity, but the internal structure of a proposition. The copula 'has' could be paraphrased by 'exemplifies' or 'instantiates'. Bolzano's conception of truth is thoroughly non-epistemic. Some truths may never be known (by any finite mind): 'The number of blossoms that were on a certain tree last spring is a statable, if unknown figure. Thus, the proposition which states this figure I call an objective truth, even if nobody knows it.' Nor is there any allusion in the definiens to what could be known under ideal conditions.

Bolzano's explication of truth presupposes that every proposition has the structure '*x* has *y*'. But we can say something true or false by sentences such as 'It is snowing' or 'Nobody is perfect', although *prima facie*, at least, they do not seem to ascribe a property to an object. In his philosophical grammar Bolzano offers reformulations with the appropriate structure: 'The idea of a snowfall occurring here and now has objectuality' and 'The idea of a

perfect person has lack of objectuality'. (Bolzano anticipates Frege's and Russell's conception of existence as a second-order notion.) But of course, the search for such a canonical paraphrase threatens to become rather tedious when we have to deal with sentences of the form 'If *P* then either *Q* or *R*', for example. Bolzano himself was by no means sure that his programme of paraphrase could always be carried out.

The basic procedure in Bolzano's logic is that of considering 'variants' of a given proposition with respect to one or more ideas contained in it. Let us take the idea expressed by the numeral '6' to be the variandum in the proposition P_1 that Beethoven's *Symphony No. 6* is in F major. (I shall refer to this idea as [6] and to variants of P_1 with respect to it as [6]-variants of P_1.) Let us only consider objectual [6]-variants of P_1, that is, only those variants the subject-idea of which is objectual. Some of these variants are true, some are false. If we want to determine the ratio between true variants and all variants we must forbid the replacement of [6] by any equivalent idea. Otherwise the floodgates would be opened for infinitely many ideas: [7-1], [8-2], [9-3], and so on. Using '$P[i/j]$' to denote the proposition which differs from *P* by containing the idea *j* at all places where *P* contains the idea *i*, we can introduce the following abbreviation: *Q* is a 'relevant' variant of *P* with respect to the idea *i* contained in *P* if and only if ($Q = P$) or ($Q = P[i/j]$, the ideas *i* and *j* are not equivalent, and *Q* is objectual).Bolzano defines the 'degree of validity' (*Grad der Gültigkeit*) of a proposition with respect to its component *i* as the ratio between the number of all its relevant *true i*-variants and the number of *all* its relevant *i*-variants. This degree of validity can be represented by a fraction the numerator of which is the first of those numbers and the denominator of which is the second. Thus the degree of validity of P_1 with respect to [6] is $\frac{2}{9}$. (Bolzano makes important use of this machinery in his theory of probability.) With respect to [6], the degree of validity of the proposition P_2 that Beethoven's *Symphony No. 6* contains more than one note is one, since all relevant variants of P_2 are true. Such propositions are universally valid (*allgemeingültig*) with respect to a component idea. With respect to [6] the degree of validity of the proposition P_3 that Beethoven's *Symphony No. 6* consists of a single note is zero, since all relevant variants of P_3 are false. Such propositions are universally invalid (*allgemein ungültig*) with respect to a component idea.

4 Analyticity, deducibility and consequentiality

A proposition is 'analytic' (in the broader sense), Bolzano explains, if and only if it contains at least one idea *i* such that it is either universally valid or universally invalid with respect to *i*. All other propositions are synthetic. Hence propositions P_2 and P_3 above are both analytic, whereas P_1 is synthetic. A proposition is 'logically analytic' if and only if it is either universally valid or universally invalid with respect to all the nonlogical ideas contained in it. Hence 'Whatever is square is square' expresses a logically analytic truth, since presumably the concept of a square is the only nonlogical idea in this proposition. Bolzano, like Tarski (1936), takes the borderline between logical and nonlogical ideas not to be sharp. Using a convenient terminology introduced by Quine we can say: a logically analytic truth contains only logical ideas essentially; any other idea occurring in it can be varied at will without engendering falsity. (Quine acknowledges the affinity of his view of logical truth to Bolzano's conception.) A truth which is analytic in the broader sense contains at least one idea nonessentially. (There is no counterpart to broad analyticity in Quine.)Bolzano explains analyticity as a property of propositions, not of sentences. This explanation is, like his account of truth, strictly non-epistemic, and it is vastly different from the Kantian one (see Kant, I. §4): for Bolzano, to illustrate just one of the many differences, your utterance of 'This cup which was taken from my cupboard is broken', expresses an analytic truth with respect to the intuition expressed by the demonstrative in your utterance if all the cups in your cupboard happen to be broken.

P and *Q* are 'compatible' (*verträglich*) with respect to idea *i* if and only if there is an idea *x* such that both $P[i/x]$ and $Q[i/x]$ are true. *Q* is 'deducible' (in the broader sense) from *P* with respect to idea *i* if and only if *P* and *Q* are compatible with respect to *i* and for all ideas *x*, if $P[i/x]$ is true then $Q[i/x]$ is true. Hence nothing is deducible (*ableitbar*) from a contradiction. As deducibility with respect to an idea is a relation between propositions, it is neither a syntactic nor a semantic relation in the modern sense. The proposition P_4 that in Prague it was warmer in August 1830 than it was in July 1830 is deducible from the proposition P_5 that in Prague the thermometer registered higher in August 1830 than it did in July 1830, and vice versa, with regard to the chronological and geographical ideas they contain, since every variation on any of these components that transforms P_4 into a true proposition also makes P_5 true, and vice versa. *Q* is 'logically deducible' from *P* if and only if *Q* is deducible from *P* with respect to all nonlogical ideas contained in them. This conception, or rather its generalization as found

in Bolzano, has often been described as a forerunner of Tarski's notion of logical consequence, and that is whatTarski himself took it to be.

Bolzano contrasts deducibility with 'consequentiality' (*Abfolge*) which only obtains between true propositions and which is never reciprocal. When a truth is deducible from and explained by another truth it is its consequence. Suppose propositions P_4 and P_5 above are true. Obviously P_4 is not a consequence of P_5: It is not the case that there was a rise in temperature *because* the thermometer registered higher. Rather, P_5 is a consequence of P_4. Bolzano also maintains that for all truths *P*, the proposition that it is true that *P* is a consequence of the proposition that *P*, while admitting that such propositions are always reciprocally deducible. Since nothing is its own consequence, Bolzano (as opposed to Frege and F.P. Ramsey (§4)) takes 'It is true that *P*' and '*P*' to express *different* propositions.

Bonaventure (*c.*1217-74)

Bonaventure (John of Fidanza) developed a synthesis of philosophy and theology in which Neoplatonic doctrines are transformed by a Christian framework. Though often remembered for his denunciations of Aristotle, Bonaventure's thought includes some Aristotelian elements. His criticisms of Aristotle were motivated chiefly by his concern that various colleagues, more impressed by Aristotle's work than they had reason to be, were philosophizing with the blindness of pagans instead of the wisdom of Christians.

To Bonaventure, the ultimate goal of human life is happiness, and happiness comes from union with God in the afterlife. If one forgets this goal when philosophizing, the higher purpose of the discipline is frustrated. Philosophical studies can indeed help in attaining happiness, but only if pursued with humility and as part of a morally upright life. In the grander scheme of things, the ascent of the heart is more important than the ascent of the mind.

Bonaventure's later works consistently emphasize that all creation emanates from, reflects and returns to its source. Because the meaning of human life can be understood only from this wider perspective, the general aim is to show an integrated whole hierarchically ordered to God. The structure and symbolism favoured by Bonaventure reflect mystical elements as well. The world, no less than a book, reveals its creator: all visible things represent a higher reality. The theologian must use symbols to reveal this deeper meaning. He must teach especially of Christ, through whom God creates everything that exists and who is the sole medium by which we can return to our creator.

Bonaventure's theory of illumination aims to account for the certitude of human knowledge. He argues that there can be no certain knowledge unless the knower is infallible and what is known cannot change. Because the human mind cannot be entirely infallible through its own power, it needs the cooperation of God, even as it needs God as the source of immutable truths. Sense experience does not suffice, for it cannot reveal that what is true could not possibly be otherwise; so, in Bonaventure's view, the human mind attains certainty about the world only when it understands it in light of the 'eternal reasons' or divine ideas. This illumination from God, while necessary for certainty, ordinarily proceeds without a person's being conscious of it.

1 Life and works

The scholastic philosopher and theologian John of Fidanza, honoured as the 'Seraphic Doctor' but better known as Bonaventure, was born in Bagnoregio, a small town in Tuscany. After preparatory education in his home town, he completed a master's degree in arts at the University of Paris. There he joined the Franciscan order (*circa* 1243), taking the name Bonaventure probably to mark his entry into religious life. Bonaventure went on to study theology under the leading Franciscan masters at Paris during the years 1243-8, first with Alexander of Hales, a famous theologian whose influence is evident in Bonaventure's works, then with John of La Rochelle and Odo Rigaud. As an advanced theology student, he lectured on the Bible (1248-50) and the *Sentences* of Peter Lombard (1250-2). From 1253 to 1257, when he resigned his position to serve as minister general of the Franciscan Order, Bonaventure was regent master of the Franciscan school at Paris. Works composed during this period include the disputed questions *De scientia Christi (Concerning Christ's Knowledge)* and *De mysterio Trinitatis (On the Mystery of the Trinity)*. The *Breviloquium*, a highly condensed summary of theology for beginners, probably dates from around 1257.

The Franciscans were badly divided when Bonaventure became the Order's head. Many believed that the prophecies of Joachim of Fiore concerning a new, spiritual age of history were to be fulfilled by drastic institutional changes and commitment to the life of wandering mendicancy exemplified by St Francis. Though Joachim's teachings influenced Bonaventure's view of history, he himself thought that only a chosen few were suited to live as St Francis did: the time had not yet come for the transformation of the world. Bonaventure did his best to control the extremists, give the order a firmer institutional structure and articulate an understanding of Franciscan poverty compatible with university study and teaching.

Bonaventure's struggles as minister general often receive only passing mention in philosophical accounts of his work, and his conflicts with heterodox masters of arts at Paris naturally appear to have greater philosophical

import. However, the emphasis on the latter tends to conceal one of the most serious dilemmas Bonaventure faced. As he opposed the cult of Aristotle at Paris, so he opposed the cult of apocalyptic asceticism in his own order. The same thinker now sometimes regarded as an anti-intellectual theologian was regarded by some of his own confrères as a creature of the universities who had betrayed the spirit of St Francis. When viewed in context, Bonaventure's writings are remarkable less for the occasional polemics than for the balanced vision he consistently worked to communicate.

After two years of governing the Franciscan Order, Bonaventure retreated to Mount Alverno in Italy, where he wrote the *Itinerarium mentis in Deum (Journey of the Mind to God)*. The intellectual ascent described in this work suggests a solution to the problem of learning within the Franciscan Order (see Brown 1993). Bonaventure does not urge his readers to repudiate the world; he tells us how we may see there the power, wisdom and goodness of its creator. Beginning with contemplation of sensible things, we may rise by stages to contemplation of the soul as the image of God, God's presence within the soul and the attributes of God himself. Philosophical studies aid in the ascent, but only if pursued with humility and as part of a morally upright life: the external world has little use as a mirror 'unless the mirror of our soul has been cleansed and polished.' Bonaventure explains the relations between philosophy and other divisions of human knowledge in *De reductione artium ad theologiam (On Retracing the Arts to Theology)*, a highly condensed treatise of unknown date, possibly based on a sermon preached towards the end of his regency at Paris.

Bonaventure's 'collations' - *Collationes de decem praeceptis (On the Ten Commandments)*, *Collationes de septem donis Spiritus Sancti (On the Seven Gifts of the Holy Spirit)* and *Collationes in Hexaemeron (On the Six Days of Creation)* - represent three series of sermons given during Lent to Franciscans studying and teaching theology at the University of Paris. The third series was cut short in May of 1273, when Pope Gregory X appointed Bonaventure cardinal bishop of Albano. He left Paris to meet with the pope, to be consecrated as bishop (November 1273) and to help with preparations for the Second Council of Lyons. He died unexpectedly in July 1274, shortly before the Council ended, and was buried in the Franciscan church at Lyons.

The three series of Lenten sermons mentioned above bear witness to growing tensions at Paris. Some members of the arts faculty at the University of Paris had taken to defending views contrary to Christian doctrine - defending them, if not as true in the absolute sense, at least as positions that human reason, unaided by faith, seemed legitimately to reach. They tended to see Aristotle as the pinnacle of human reason, and Averroes, who advocated the separation of philosophy from theology, as Aristotle's foremost interpreter (see Aristotelianism, medieval; Averroism). Scandalized by the trend toward neo-pagan philosophizing, Bonaventure in his sermons cites various doctrines popular in the arts faculty as examples of the errors philosophers inevitably make when their reasoning is unillumined by faith. Some of the same views he attacked in 1267 and 1268 were formally condemned by the Bishop of Paris in 1270, but apparently with little effect. Bonaventure's sermons of 1273 accordingly display an even greater sense of urgency. The crisis culminated, three years after his death, in the most extensive doctrinal condemnation of the Middle Ages.

Bonaventure's works fall into different genres, related to the two stages of his career: the period when he was studying and teaching at Paris and the period beginning in 1257, when he resigned his university position to become minister general of the Franciscans. Most works from the first period are academic exercises with a conventional form. In his commentary on the *Sentences* and disputed questions, for example, Bonaventure cites authorities and marshals arguments on both sides of an issue before presenting his own resolution and answering objections to it. His later works differ strikingly from these academic compositions. The *collationes*, it should be remembered, are university sermons, and even the *Itinerarium* has some of the hallmarks of a sermon. The genre should be kept in mind when comparing Bonaventure's later works with academic productions by contemporaries, such as the *Summa theologiae* of Thomas Aquinas.

2 Neoplatonism and mysticism

In the second stage of his career Bonaventure's writing becomes rich in metaphor and heavily reliant on symbolic modes of expression. An elaborate hierarchical structure, itself of symbolic significance, replaces the pro-and-con method characteristic of scholastic compositions. Here we see a writer who, though eloquent, operates within a carefully controlled structure. Unfortunately, even the best translations cannot preserve the many layers of meaning in Bonaventure's language. Today's readers are likely to recognize that the metaphysics of participation

and exemplarism, like the themes of light and illumination, emanation and return, have older philosophical roots in Plato and the ancient Neoplatonists. At the same time, they may be tempted to dismiss all the complicated divisions and subdivisions in Bonaventure's writings as so much stylistic embellishment. The temptation should be resisted, for what looks like ornament turns out to be more substantial.

Works like the *Itinerarium* and the *collationes* draw on a Christian tradition well known to Bonaventure's contemporaries but now generally neglected. Perhaps the most basic idea is that all creation emanates from, mirrors and returns to its source - a fundamentally Plotinian doctrine prominent in the writings of Augustine (see Plotinus). Because the meaning of human life can be understood only from this broader perspective, the overarching aim is to show an interrelated totality hierarchically ordered to God. The structure of Bonaventure's later works reflects this ordering. As the structure is significant, so too is the symbolism, derived partly from mystical writings by the twelfth-century school of St Victor. Building on the thought of Augustine and the Pseudo-Dionysius, Hugh of St Victor taught that God communicates his plans everywhere, in a symbolic language we must learn to recognize and decipher. The world is like a book, revealing its author no less than Scripture does (see Zinn 1973). All creation reflects the triune character of God; all visible things represent an invisible, transcendent reality. The theologian must accordingly use symbols to show what cannot be expressed more directly. He must demonstrate the deeper meaning and order of the world, helping us to rise above the confusing multiplicity presented by our senses. To do so, he must teach especially of Christ, the Word through whom all things are created, the source of all true wisdom and the medium enabling us to return to God (see Mysticism, history of).

This sketch of the intellectual background may help to explain not only the hierarchical structure of Bonaventure's later works but also the significance he attached to numbers: threefold divisions symbolize the Trinity, sixfold divisions symbolize the six days of creation and so on (see Neoplatonism). Of course, Neoplatonic and mystical writings are hardly Bonaventure's only sources. Like all masters schooled at Paris in the mid-thirteenth century, he studied Aristotle closely and often appealed to Aristotle's teachings. Stoic doctrines, derived from Cicero and patristic writers, are equally present in his thought (see Patristic philosophy; Stoicism). The philosophical eclecticism displayed by the earliest Christian thinkers is even greater among the scholastics, so that scholarly debates about whether a given master is Aristotelian, Neoplatonic or something else - debates extremely common in the literature on Bonaventure - are fundamentally disagreements about the dominant strains in a mixed breed.

3 Happiness and the limits of philosophy

What Bonaventure considers to be the place and function of philosophy becomes easier to understand if one reflects upon happiness, the end of human life. By nature we strive for happiness, and we can never be fulfilled unless we attain it. This ultimate goal has both practical and speculative implications. As Bonaventure explains in Chapter 1 of the *Itinerarium*, 'Since happiness is nothing else than the enjoyment of the Supreme Good, and the Supreme Good is above us, no one can enjoy happiness unless he rise above himself - not, of course, by a bodily ascent, but by an ascent of the heart.'

The ascent of the heart involves the ascent of the mind, and yet the mind takes us only so far. The complete happiness experienced through union with God comes more from love than from knowledge, more from will than from intellect. Small wonder, then, that Bonaventure consistently emphasizes the higher purpose of speculation. Anyone who remains ignorant of this purpose, or who knows it but loses sight of it, is doomed not only to frustrated desire but also to intellectual confusion. A good philosopher must therefore understand the place of philosophy within the wider context of human life. As no one can perceive the beauty of a poem unless he sees the whole, Bonaventure argues, so no one can grasp the beauty of the order regulating reality unless he views it in its totality (see Faith).

Bonaventure's conviction that union with God constitutes the ultimate goal of all learning might well lead one to wonder whether philosophy has any genuine place in his thought. Why devote time to studying logic, much less the writings of pagan philosophers, when the example of St Francis proves such studies unnecessary for attaining the goal of eternal happiness? The title of one of Bonaventure's best-known treatises, *De reductione artium ad theologiam*, can reinforce the impression that he values the art of philosophy only insofar as philosophy can be 'reduced' to theology. This impression is misleading not only because the title, like the titles of many scholastic

works, was invented by later editors rather than the author himself, but also because the term *reductio* is properly translated as 'retracing' rather than 'reducing'.

For Bonaventure, *reductio* signifies both a process and a method of analysis (Bougerol 1964, 1988). As a process, it is the return to God, in whom all rational beings find their fulfilment. While individuals may or may not choose the path that leads them home, the process of humanity's return to its source continues to operate. God's grace, working ever to draw us back to himself, governs the historical process and gives it meaning. Hence, *reductio* can also serve as a method of analysis. Humans, as rational beings, find the path home more easily when someone shows them how the various areas of human knowledge are so many rungs of a ladder, all leading in the same direction. As a method of analysis, *reductio* accordingly seeks to demonstrate how the many lead to the one, the composite to the simple, even as the many and the composite are based on and derive a deeper meaning from the one and the simple. The aim is to articulate an intelligible order and direction by bringing out fundamental organizing principles; it is not to boil away everything else, as cooks do in 'reducing' a sauce. While philosophy should point in the right direction and understand its place in the wider context, it need not be distilled into theology to become valuable. Logic is well worth studying, even though it teaches us nothing about the meaning of life.

The culinary interpretation of Bonaventure's *reductio* of the arts to theology arises partly from his claim that all divisions of human knowledge are 'handmaids of theology'. They surely are 'handmaids' in the sense that they have a higher purpose. Anyone who pursues philosophy or any other art strictly as an end in itself, as if there were nothing more exalted or fulfilling, is making a disastrous mistake. On the other hand, to say that philosophy is not the pinnacle of human life is not to say that it has value only insofar as it can be distilled into theology. As Bonaventure makes philosophy a handmaid of theology, so he also makes agriculture and navigation handmaids of theology. Is he arguing that farmers are worthless unless they sow their crops in threes, or that sailors cannot chart a course to Rome without fixing on God? Not at all. To argue that an art has a higher purpose is not to insist that it has no legitimacy or value in its own domain.

Bonaventure's attitude towards Aristotle's philosophy should be understood within the context of his views on philosophy in general. In the *Collationes in Hexaemeron*, where he traces the most serious errors of philosophy to Aristotle's rejection of exemplar ideas and his affirmation that God knows only himself, Bonaventure's preference for a broadly Platonic metaphysics is evident. His diatribe, however, is much less against Aristotle than against members of the Paris arts faculty who defended as philosophically sound virtually every position they believed Aristotle had held. In Bonaventure's view, even the best philosophers of antiquity were ignorant of original sin and the need for God's grace. Knowing nothing of Christ, and having to rely exclusively on their own powers of reason, the ancients could not help but make grave mistakes. Bonaventure accordingly urges the arts masters to philosophize as Christians, with the illumination of faith to guide them (see Aristotelianism, medieval; Platonism, medieval).

4 Knowledge of God's existence

Though Bonaventure offered proofs for the existence of God in other works, the twenty-nine arguments in his disputed questions *De mysterio Trinitatis* represent his most developed treatment of the topic (see Doyle 1974). The arguments go on to prove three conclusions: that every truth impressed on all minds is an indubitable truth, that every truth which all creatures proclaim is an indubitable truth and that every truth that is in itself most certain and evident is an indubitable truth. Bonaventure's position combines these three conclusions into a single master conclusion: that the existence of God is an indubitable truth in its own right and can be doubted only because of some defect in the knower. A human being might doubt God's existence from failing to understand correctly what the term 'God' signifies. Doubt might likewise spring from failing to carry one's thinking far enough, or from having only a partial view of the evidence. In all cases, Bonaventure argues, doubt arises from failures of the human intellect, not from God's existence as a truth considered in itself.

In arguing that God's existence is self-evident, Bonaventure repeatedly appeals to Anselm's *Proslogion* (see Anselm of Canterbury). He argues, for example, that God is 'a being than which nothing greater can be thought'; but that which exists only in thought does not meet this description, for something existing in reality would be greater, and hence God cannot be thought not to exist in reality. Anselmian arguments are supplemented by Augustinian arguments for the existence of truth (see Augustinianism). To Bonaventure, each particular truth

implies the existence of an absolute truth that is its cause. To affirm any particular truth is thus to affirm, even though one might fail to recognize it, the existence of God (see God, arguments for the existence of).

Bonaventure's arguments reflect his belief that all human souls belong to a hierarchically ordered intelligible realm that is more real and more knowable than the world of the senses. Belonging to the same realm as God, the soul can know God's existence directly, through thought. This position stands in sharp contrast to the views of Bonaventure's contemporary, Aquinas. Sharing Aristotle's belief that we obtain knowledge from the initial data of sense experience, Aquinas taught that we can know God's existence by considering creatures and reasoning from effect to cause, but that God's existence is not self-evident to us.

5 The question of an eternal world

Bonaventure again differs from Aquinas on whether the world could have been created from eternity, a topic of heated debate in the thirteenth century. The problem, as he formulates it in his commentary on the *Sentences*, is 'Whether the world has been produced from eternity or in time.' The idea that the world was indeed produced is crucial to the question. To Bonaventure, there is nothing incoherent in believing that the world is eternal, only in believing that the world is both created and eternal (see Bonansea 1974).

Bonaventure's principal argument rests on the very notion of creation. Whatever is created in the truest sense - that is, produced from nothing rather than from pre-existing material - must come to have 'being after non-being': it must have a *beginning*. To say that something with a beginning is eternal, meaning that it has no beginning, is an obvious contradiction. Thus the thesis that the world was created from eternity is not merely false but unintelligible. In offering this argument, Bonaventure does not mean to imply that creation took place at some point within time, for he accepts the prevailing view that time began with creation. His challenge is to those who conceive of the world as both beginningless and created *ex nihilo*.

Another argument points to a problem with positing an actual, as opposed to merely potential, infinity. Bonaventure reasons that it is impossible to make the actually infinite greater, for this would be contrary to its nature, so that if the world existed from eternity, it would admit of no additional duration. In effect, extra days could not add to the number of days preceding the present, since the number preceding the present would already be infinite, and all actual infinites, Bonaventure assumes, must be equal. How could we even have reached the present day if infinitely many days had to elapse before today? One need not review all of Bonaventure's arguments to see how the notion of a world created from eternity raised issues, such as the problem of unequal infinites, that were of more than theological interest (see Eternity of the world, medieval views of).

6 Metaphysics

Bonaventure's metaphysics, by his own description, is a doctrine of emanation, exemplarism and consummation or return. To his mind, anyone who denies the existence of exemplar ideas might reasonably draw the kind of conclusions drawn by Aristotle: that the first cause knows only itself and 'moves' the world only as a final cause, as an object of desire rather than as an agent and efficient cause. Even though his teachings recall Plotinian doctrine on emanation from the One, Bonaventure's metaphysics owes much more to the distinctively Christian Neoplatonism of Augustine. In place of the One we find God; in place of a world emanating necessarily from the very nature of the One we find a world God created freely, out of nothing. The world comes from God as its efficient cause, mirrors God, the exemplar cause, and is destined to return to God as its end or final cause (see Creation and conservation, religious doctrine of).

As archetypes of all actual and possible creatures, exemplar ideas help to explain both how God made what exists and how he knows everything that could be. The plurality of ideas does, however, raise questions about the unity of God. Bonaventure explains that there is no real plurality of ideas in God. As they are not distinct from God himself, so they are not distinct from each other. Properly understood, the exemplar ideas are distinct only from the standpoint of reason. What 'idea' actually signifies is a creature's relation to God.

Bonaventure's 'universal hylomorphism' - the doctrine that all creatures are composed of matter and form - turns out to be less bizarre than it seems at first glance. For him, 'matter' is a principle of potentiality that may or may not be corporeal. Because all beings other than God are susceptible to change, and change is the actualization of potential, all beings other than God must have an element of potentiality. Thus the 'spiritual matter' of angels is

matter understood on an analogy with the corporeal matter of human beings, similar only in its status as a principle of potentiality and necessary complement to form.

7 The illumination of the intellect

Bonaventure's theory of knowledge roughly conforms to that of Aristotle as regards knowledge of the sensible world. Declaring the human mind a *tabula rasa* (blank slate) at birth, he teaches that we cannot acquire concepts of material objects, much less a knowledge of biology, without abstracting from sense experience. Aristotle's empiricism nonetheless has limitations: it fails to account for our idea of God, and fails even more miserably in accounting for certitude.

Bonaventure does not claim that the idea of God is innate in the sense that it is present at birth or will inevitably develop as the child matures. The idea might nonetheless be considered innate insofar as it is does not depend on abstraction from sense experience. To acquire the idea of God, the soul need only turn inward and reflect on its own nature, or on its natural desire for complete happiness, which God alone can provide. In arguing that the idea of God does not come from presentations of the senses, Bonaventure's purpose is mainly to emphasize that the human soul, made in God's image and belonging to the intelligible realm, need not have recourse to the material world to know its creator.

The theory of illumination, well presented in question 4 of Bonaventure's disputed questions *De scientia Christi*, aims above all to account for the certitude of human knowledge. In his view, there can be no certain knowledge without both infallibility on the part of the knower and immutability on the part of the object of knowledge. Because the mind of a creature cannot be entirely infallible through its own power, it needs the cooperation of God, even as it needs God as the source of immutable truths. Sense experience does not suffice, for it cannot reveal that what is true could not possibly be otherwise. The human mind attains certitude about the world only when it understands it in light of the 'eternal reasons' or divine ideas. In doing so, the mind will ordinarily be unconscious of divine illumination. Certitude, however, would be impossible if God did not provide an immutable object of knowledge and move the mind to assent (see Illumination).

In arguing for his theory of illumination, Bonaventure expressly denies that God is the sole source of human certainty. Such a view would fail to distinguish earthly knowledge from heavenly knowledge, knowledge of nature from knowledge of grace, and knowledge by reason from knowledge by revelation. On the other hand, Bonaventure thinks it insufficient for the knower to benefit from the eternal reasons without attaining to them. The human mind could not acquire certain knowledge if it did not in some way rise above the created order. According to Bonaventure, this is possible because, and insofar as, the soul is the image of God. Sense experience remains necessary as a source of our ideas about the world, but what certainty we attain comes from the cooperation of God.

8 Virtue

Bonaventure's doctrine of virtue, as presented in his *Collationes in Hexaemeron*, clearly reflects his metaphysics and theology (see Synan 1973). Since the end of virtue is happiness, which comes from the enjoyment of God in the afterlife, virtues must be ordered to that end. They must help us return to our creator. Return, however, is possible only through Christ; without Christ, human beings remain infected with original sin and doomed to remain forever separated from God. Indeed, at their fourth, highest level of reality, the virtues exist in Christ as exemplar ideas.

Virtues in human beings participate in these divine exemplars to various degrees. The cardinal virtues of prudence, justice, temperance and fortitude may accordingly be possessed at any of three levels. At the lowest level they are 'political' and belong to us insofar as we are social animals; at the next they are 'cleansing' and belong to us insofar as we are fit for God; and at the next they belong to those already completely cleansed. At all levels of the hierarchy human virtues depend for their reality on the exemplars. The cardinal virtues likewise also depend on the theological virtues of faith, hope and charity to attain their perfection and achieve their ends.

The four-level hierarchy of virtue comes from Macrobius' commentary on Cicero's *Dream of Scipio*, a work that explains the teachings of Plotinus. This Neoplatonic material is nevertheless transformed, not only by the addition of the theological virtues but also by Bonaventure's recasting of the cardinal virtues as products of grace and the

foundation of that ‘merit’ which makes us deserving in the eyes of God. In his commentary on the *Sentences*, he explains that merit is rooted in free decision (*liberum arbitrium*). Thus the cardinal virtues can belong only to the intellect and the will, those powers of the soul that share in free decision. Bonaventure even argues that *all* virtues, insofar as they are virtues, must belong to the rational part of the soul. Virtues are attributed to the lower, emotional part of the soul only because habituation makes it more submissive to reason; they cannot exist principally in the seat of the passions because they would then be beyond the scope of free decision. One would be attributing virtues to the part of the soul we have in common with animals instead of to the part we have in common with angels (see Kent 1995).

For Bonaventure, then, a virtue such as fortitude has less to do with our emotional responses to danger than with what we freely decide. The appropriate emotional responses are not essential to virtue; at most they are ‘annexed’ to it. While this view would seem to have distant origins in the Stoic restriction of virtue to what lies within the agent’s control, the emphasis on virtue as the basis of merit is of no small significance. It is one thing to see virtues as traits of character that make us happy in this life, another to see them as traits of character that make us deserving of happiness in the afterlife.

The influence of theology in Bonaventure’s thought appears to have two results that some of today’s moral philosophers - especially those sympathetic to Kant - would find appealing. First, virtue comes to depend on the freedom that all rational creatures have in common, even as the moral significance of emotions declines sharply. Second, it becomes quite reasonable to say that someone is both virtuous and unhappy, for virtue is now what makes someone deserving of happiness, even though internal emotional conflict, illness and misfortune may in fact cause the person great suffering (see Virtue ethics; Virtues and vices).

Bonhoeffer, Dietrich (1906-45)

Dietrich Bonhoeffer was a twentieth-century Lutheran theologian who associated Christian belief and political action in an exemplary fashion. His part in the struggle of the Confessing Church and of the German resistance against the National-Socialist dictatorship cost him his life. Christocentric and ecclesiocentric, he stressed personal and collective piety and revived the idea of the imitation of Christ; the concepts of obedience and of the suffering God are central to his view. His Ethik *(1949) was widely influential; in it, he argued that Christians should not retreat from the world, but have a duty to act within it. His answer to the secularization of the modern world was a 'religionless Christianity', a communocentric, pietistic, personal discipline.*

1 Life and theological background

Born in Breslau, Bonhoeffer was raised in Berlin in an intellectual milieu. Early in his life he felt a vocation to be a theologian and studied at Tübingen in 1923 and Berlin from 1924 to 1927. His dissertation was a theological reflection on the sociology of the Church, which critically examined Hegel, Max Weber and Ernst Troeltsch. Bonhoeffer had just discovered Karl Barth's dialectical theology and was anxious to relate Christology to ecclesiology (see Barth, K. §§1-2). In opposition to liberal and sociological views, he asserted that the Church is the body of Christ concretely. His other early writings show the influence of Kant, Heidegger, Barth and Luther.

Following the rise of Hitler, Bonhoeffer helped to organize the Pastor's Emergency League, and took a stand against the racist policies of National Socialism, publishing 'Die Kirche vor der Judenfrage' (The Church and the Jewish Question) (1933a) and Der Arierparagraph in der Kirche (The Aryan Paragraph in the Church) (1933b). His involvement with the Confessing Church, which Karl Barth had helped organize, led to his being banned from teaching and publishing. In 1938, he came into contact with the political resistance against National Socialism. He worked with the resistance until 1944, when, in the wake of the failed attempt on Hitler's life, he was arrested, imprisoned and later hanged.

Bonhoeffer's original contribution to Christian theology was prompted by historical circumstances, particularly the National Socialist dictatorship. However, a number of quite varied influences can be detected in his work, notably dialectical theology, which he discovered in the early 1930s, Moravian Pietism, Lutheranism, Roman Catholicism, and the neo-Protestantism of Wilhelm Herrmann, Adolf von Harnack, Ernst Troeltsch, Max Weber, Martin Kähler, Rudolf Otto, Karl Holl and Wilhelm Dilthey. Bonhoeffer's critical stance towards the phenomenon of religion was inspired by Barth's distinction between faith and religion, and his assertion that revelation abolished religion.

Bonhoeffer understood Christian faith as a combination of Old Testament legalism and New Testament Christocentrism. It seems that he experienced a conversion in 1931, while studying the Sermon on the Mount and Psalm 119, the famous love poem to the Law. To him, the central issue was that of obedience, and the concept of discipleship grew into a major theological theme. It culminated in *Nachfolge (Following After)* (1937), a study of the imitation of Christ in the Gospels, in which Bonhoeffer argues that 'only the believer is obedient, and only the obedient believes'. He believed that faith consists in following in Jesus Christ's footsteps by accepting God's messianic suffering. Two elements are constitutive of faith: the implementation of justice and the acceptance of divine suffering. Jesus' agony only ends with the end of the world. In Bonhoeffer's theology of the cross, God is not the triumphant and enthroned God of Isaiah 6, but a God of suffering, suffering in the world and for the world. Discipleship, then, is following Christ at Gethsemane.

2 Ethics

Begun in 1940, Bonhoeffer's *Ethik* was published as fragments in 1949 by Eberhard Bethge. It is Bonhoeffer's *magnum opus*, and must be understood against the background of his political involvement. In June 1939, he had refused to move to the USA, even though staying in Germany meant accepting a double life, simultaneously this-worldly and other-worldly. For Europe was in a such a predicament that, in his view, Christians were not morally allowed to retreat from the world. On the contrary, it behoved Christians to be involved in worldly affairs and to collaborate with non-Christians. Consequently, Christian theology had to address the question of the possibility of acknowledging the world from a Christocentric perspective. Bonhoeffer propounded five major ideas. First, though distinct, the Christian community and the world should not be kept apart. Christian action

always is action in the world. Faith is not an escape from the world, but is existentially this-worldly. Second, the world is the world accepted by Christ, who is the uniting principle of Western civilization. Third, a Christian's participation in the reality of Jesus Christ and in the reality of the world, even a Godless world, is possible because in Christ God enabled us to participate concomitantly in a dual reality, that of God and that of the world. Fourth, only in the reality of the world can one truly be a Christian. But there is no real worldliness except in the reality of Jesus Christ. Christ's sovereignty is the focal concept of Christian ethics. Finally, penitence clears the path for the imitation of Christ or discipleship.

3 Nonreligious interpretation of Christianity

In a letter from prison, dated 30 April 1944, Bonhoeffer introduces and discusses the concept of religionless Christianity. He often referred to this idea as the nonreligious interpretation of Christianity. As early as his dissertation, *Sanctorum communio* (1930), Bonhoeffer had argued for a nonreligious Christianity. His diagnosis of the 'churchliness of the modern bourgeoisie' led him to call the Church back to a more sincere and genuine community modelled on Christ. He was dismayed by the empty religiosity of the Church and further outraged by its passive enslavement to National Socialism. Under the joint influences of Dilthey, Kant and Barth, he developed a negative concept of religion. According to Bonhoeffer, Christian religion is 'a historically conditioned and transient form of human self expression'. Religion is a human answer to anxiety. In the human quest for security, God is the ultimate refuge. Towards the close of the Middle Ages, people ceased to believe in the authority of the Church. European thought turned away from other-worldliness towards this-worldliness, intellectual autonomy was established and personal emancipation encouraged. The Enlightenment and the subsequent nineteenth-century revolutions anticipated 'the world come of age' of the twentieth century. Progressive secularization transformed the Christian world into a world without God. The religious interpretation of life and history has ended, and religion is ending as well. This process is irreversible. The end of religion also implies the end of traditional Christianity. In a world beyond Christendom, a world come to adulthood and further progressing towards a religionless time, the only suitable apologetics consists in providing a nonreligious interpretation of Scripture. The Bible is not a religious book, but the story of a people progressing through suffering towards justice and God's kingdom.

Bonhoeffer's response to the demise of Christianity was both pietistic and ethical; it was a theological extrapolation of the piety of his home life. His call for a nonreligious Christianity was a call for a sincere Christocentric and communocentric Christianity. It was an attempt to bring Christian life into harmony with Christian discourse. In our secular world, Christianity can recover its identity only as a personal and secret discipline. In his most widely read book, *Gemeinsames Leben (Life Together)* (1939), he argued for the renewal of some forms of monastic life in order to serve the world. Bonhoeffer's courageous death at the hands of the National Socialists testified to his belief that 'before God and with God we live without God'.

JEAN-LOUP SEBAN

List of works

Bonhoeffer, D. (1986-96) *Dietrich Bonhoeffer Werke*, ed. E. Bethge *et al*., Munich: Chr. Kaiser Verlag, 16 vols; various translators, ed. W.W. Floyd, Jr, *Dietrich Bonhoeffer's Works*, Minneapolis, MN: Fortress Press, 1995-. (The new critical edition, with extensive introductions, notes and bibliographies; the English version is still appearing at the time of writing.)

Bonhoeffer, D. (1965-7) *Gesammelte Schriften (Collected Writings)*, ed. E. Bethge, Munich: Chr. Kaiser Verlag, 5 vols; selections trans. E.H. Robertson and J. Bowden, ed. E. Robertson, *No Rusty Swords: Letters, Lectures and Notes 1928-1936*; *The Way to Freedom: Letters, Lectures and Notes 1935-1939*; *True Patriotism: Letters, Lectures and Notes 1939-1945*, London: Collins, 1965-7.(The English volumes selected from this earlier complete edition contain much that is still not available elsewhere, as well as a detailed chronology of Bonhoeffer's life.)

Bonhoeffer, D. (1930) *Sanctorum communio: eine Untersuchung zur Sociologie der Kirche*, Berlin and Frankfurt-an-der-Oder: Trowitzsch & Sohn; trans. R. Gregor Smith, *Sanctorum Communio: A Dogmatic Inquiry into the Sociology of the Church* [in the USA: *The Communion of Saints:…*], London: Collins, 1963. (Bonhoeffer's 1927 Berlin doctoral dissertation, a somewhat technical sociological and theological discussion of personhood, community, sin and the Church.)

Bonhoeffer, D. (1931) *Akt und Sein: Transzendentalphilosophie und Ontologie in der systematischen Theologie*

(Act and Being: Transcendental Philosophy and Ontology in Systematic Theology), Gütersloh: C. Bertelsman; trans. B. Noble, Act and Being, London: Collins, 1964.(Bonhoeffer's *Habilitationsschrift*, a highly technical piece in which he claims that theology can mediate between an act-based philosophy associated with Kant - and Barth in theology - and a being-based philosophy associated with Heidegger, among others.)

Bonhoeffer, D. (1933a) 'Die Kirche vor der Judenfrage', in *Gesammelte Schriften*, ed. E. Bethge, vol. 2, Munich: Chr. Kaiser Verlag, 1965-7; trans. E.H. Robinson and J. Bowden, 'The Church and the Jewish Question', in *No Rusty Swords: Letters, Lectures and Notes 1928-1936*, ed. E.H. Robertson, London: Collins, 1965-7.(After the boycott of Jewish businesses was declared on 1 April 1933 and the German Church banned Jews from positions of authority on 7 April, Bonhoeffer delivered this lecture against anti-Semitism, trying to reclaim pro-Semitic emphases in Luther.)

Bonhoeffer, D. (1933b) 'Der Arierparagraph in der Kirche' (The Aryan Paragraph in the Church), in *Gesammelte Schriften*, ed. E. Bethge, vol. 2, Munich: Chr. Kaiser Verlag, 1965-7.(In this leaflet, Bonhoeffer presented a set of theses and antitheses, arguing against the anti-Semitic stance of the German Christians.)

Bonhoeffer, D. (1933c) *Schöpfung und Fall: theologische Auslegung von Genesis 1-3*, Munich: Chr. Kaiser Verlag; trans. J.C. Fletcher, *Creation and Fall: A Theological Interpretation of Genesis 1-3*, London: SCM, 1959.(In a very different mode, Bonhoeffer interprets Genesis in a way reminiscent of Karl Barth on Romans: treating it as a book of the Church, to be interpreted in and for the Church.)

Bonhoeffer, D. (1933d) 'Christologie', in *Gesammelte Schriften*, ed. E. Bethge, vol. 3, Munich: Chr. Kaiser Verlag, 1965-7; trans. J. Bowden, *Christology* [*Christ the Center* in the USA], London: Collins, 1961.(An unfinished lecture course, which treats of 'the present Christ' and 'the historical Christ', and presents Christ as the boundary and hidden centre of reality.)

Bonhoeffer, D. (1937) *Nachfolge (Following After)*, Munich: Chr. Kaiser Verlag; trans. R.H. Fuller, *The Cost of Discipleship*, London: SCM, enlarged edn, 1959.(A very influential nontechnical condemnation of 'cheap grace' - a reminder of the way of the Cross, and the harsh calls of Jesus' Sermon on the Mount.)

Bonhoeffer, D. (1939) *Gemeinsames Leben*, Munich: Chr. Kaiser Verlag; trans. J.W. Doberstein, *Life Together*, New York: Harper, 1954.(A description of Christian community, based, like *The Cost of Discipleship*, on Bonhoeffer's experience of common life in an irregular seminary in Finkenwalde, closed by the Gestapo in 1937.)

Bonhoeffer, D. (1949) *Ethik*, ed. E. Bethge, Munich: Chr. Kaiser Verlag; trans. N. Horton Smith, *Ethics*, London: SCM, 1955.(An incomplete and fragmentary work, *Ethik* was written secretly by Bonhoeffer in the years before his arrest, and deals very practically with Christian citizenship and conformity to Christ.)

Bonhoeffer, D. (1951) *Widerstand und Ergebung: Briefe und Aufzeichnungen aus der Haft (Resistance and Humility: Letters and Notes from Prison)*, Munich: Chr. Kaiser Verlag; trans. R. Fuller *et al.*, *Letters and Papers from Prison*, London: SCM, enlarged edn, 1971.(Now a religious classic, this collection casts much light on the directions Bonhoeffer's thought was taking when he died. Includes 'After Ten Years', Bonhoeffer's own assessment of the 1930s and early 1940s.)

Bonhoeffer, D. (1990) *Testament to Freedom: The Essential Writings of Dietrich Bonhoeffer*, ed. G.B. Kelly and F.B. Nelson, New York: Harper.(A useful introductory reader with a long introductory essay, and a selection of letters, poems and essays, each with a short introduction.)

Bonnet, Charles (1720-93)

In his youth, Bonnet made a meticulous and creative study of insects, which won him international fame for his discoveries, as well as his methods. He turned to psychology and offered a detailed, but speculative, account of the physiology of mental states. His empirical work was overtaken by speculative ambition. In later life, he developed (from elements already present in his early studies) a comprehensive view of the universe, of its history and its natural history, of theology and of moral philosophy. Christianity was proved, the great chain of being was mapped over time towards an ultimate perfection, and human morality, based on self-love, formed part of the Creator's scheme. The Creator, at the moment of creation, brought into being all the elements from which this vast unfolding would occur, without further intervention.

1 Life and works

Charles Bonnet, Swiss naturalist and philosopher, was born in Geneva and belonged to a family which had left France during the period of persecution of Protestants in the mid-sixteenth century. A youthful interest in natural history, and in insects in particular, led to his discovery, as a result of painstaking experimentation and observation, of the parthenogenesis of aphids. He was only 18 at the time of this important discovery, but received recognition from the Académie des Sciences in Paris to which his correspondent and mentor Réaumur presented his results in 1740. He then turned his attention to the regeneration of worms cut into parts, and to the respiratory mechanism of caterpillars. At the age of 23, he was elected fellow of the Royal Society in London, and his work *Traité d'insectologie (Treatise on Entomology)* was also published in 1745.

His vision deteriorated seriously, something which Bonnet attributed to overwork at the microscope. He did not at once abandon his empirical studies, but turned to the study of leaves. He investigated their movement and anatomy, maintaining that plants displayed a form of sensibility. Though lacking some of the essential theoretical concepts, he was in effect the first to investigate photosynthesis. He published his *Recherches sur l'usage des feuilles dans les plantes (Investigations into the Function of Leaves in Plants)* in 1754.

But his interests had already turned towards psychology and philosophy. His poor eyesight made it difficult for him to read or write, so that books were read to him. Leibniz made a special impression. His subsequent writings were dictated, including the *Essai de psychologie (Essay on Psychology)* (1754b), the *Essai analytique sur les facultés de l'âme (Analytical Essay on Mental Faculties)* (1760), the *Considérations sur les corps organisés (Considerations on Organic Bodies)* (1762-8), the *Contemplation de la nature (The Contemplation of Nature)* (1764), *La Palingénésie philosophique (Philosophical Palingenesis)* (1769), as well as a collected edition of his writings which he supervised, *Œuvres d'histoire naturelle et de philosophie* (1779-83).

2 Thought

Bonnet's thought has two organizing principles, potentially in conflict, both of which stemmed from his work as an entomologist. One is the importance of classification. The second is the idea that there are no gaps in nature. Between any two differently classified items, an intermediary item can be found.

In the *Essai de psychologie* and the *Essai analytique sur les facultés de l'âme*, Bonnet put forward a sensualist psychology, like, for instance, Hartley and Condillac. Sensations consisted in the vibration of nerve fibres in the brain. Once a 'virgin fibre' had first been caused to vibrate by an external stimulus, it could subsequently vibrate for internal reasons, giving rise to other types of mental phenomena. We pass smoothly from sensations to ideas. In developing this conception, Bonnet used the same model as Condillac: that of a statue successively presented with simple sensations of smell.

In spite of his speculative physiological account of sensation and other mental operations, Bonnet was not a materialist. On the contrary, he held that sensation required the activity of the soul, which, though linked to the body at a certain point in the nervous system, was an eternally existing 'germ'. (Bonnet did not have a fixed view about where this point was situated.)

Thus, Bonnet's psychology included an application of his general doctrine of 'preformation', already envisaged in his entomological work. He considered that the parthenogenesis of aphids demonstrated the existence of preformed

germs of organisms in the female germ cell. In his *Considérations sur les corps organisés*, he argued against epigenesis, the view that ontogenesis could be explained in some mechanical or developmental fashion, and maintained that from the time of creation, the universe contained a multitude of preformed ‘germs’, whose future development was already built into them. These ideas were brought together in an even more elaborate synthesis in the *La Palingénésie philosophique*. Here we see the ‘Great Chain of Being’ presented in dynamic form. We see an eschatological cosmology spread over time: the history of the earth consists of a series of cataclysms in which all organic life is destroyed, except the germs themselves. Over time, at each moment of rebirth, the germs produce a new and more perfect instantiation of what was already built into them at the moment of creation, until the final state is reached through the resurrection (or ‘palingenesis’) announced in the Christian gospel.

Bonnet also produced an apologetic work, *Recherches philosophiques sur les preuves du christianisme (Philosophical Investigations into the Proofs of Christianity)* (1770) in which, apart from reproducing some of the traditional proofs, he explained miracles, not as divine interventions in the natural order, but as apparently anomalous events which were already provided for at the moment of creation. His moral philosophy, developed in *Philalèthe* (before 1783), goes from the avoidance of pain and the search for pleasure, through self-love, but claims that this pre-utilitarian conception has its place in a divinely planned order. The ‘invisible hand’ of Adam Smith is the hand of God.

The grandiose system which Bonnet developed was widely influential in his day. But perhaps his more lasting philosophical impact arose from his detailed physiological theory of sensation, which influenced Cabanis and Maine de Biran.

Boole, George (1815-64)

George Boole, a British mathematician, is credited with making a fundamental contribution to modern logic. If Leibniz's manuscript essays on logic, effectively unknown until the end of the nineteenth century, are excluded, thenBoole's algebra of logic (1847, 1854) was the first successful mathematical treatment of one part of logic. The treatment was mathematical in the broad sense of using a formal language expressed in symbols with definite rules. It was also mathematical in a narrow sense of being closely modelled after numerical algebra, from which it differed by an additional axiom, $x^2 = x$. *Letter symbols of this algebra were conceived as representing classes, 1 standing for a 'universe' of objects and 0 for the empty class. By identifying logical terms with their extensions, that is, with classes, inferences of a much more general character than those of the traditional syllogistic could be carried out. Boole also showed how this algebra could be used in propositional logic, presenting its earliest systematic general formulation.*

1 Beginnings

Boole, eldest child of a Lincolnshire shoemaker, had no formal secondary or higher education, though he was recognized early on as a gifted child. He taught himself Latin, Greek and the major European languages, reading widely in many subjects. At the age of 16, impelled by his family's financial hardship, he became assistant to a schoolmaster. At that time he also began the serious study of higher mathematics by reading works of the masters. At the age of 19 he opened his own school. While still teaching he managed to do mathematical research, attaining considerable prominence when he was awarded a Royal Society gold medal for a paper printed in the Society's *Philosophical Transactions*. In 1849, although without a university degree, he was appointed Professor of Mathematics at the newly opened Queen's College in Cork (now University College, Cork).

Boole's innovative ideas first appeared in a pamphlet, *The Mathematical Analysis of Logic* (1847). Boole was evidently a newcomer to the subject, as his exposition of the traditional syllogism paraphrased that contained in Richard Whately's popular treatise *Elements of Logic* (1844). Whately's conception of the subject as a formal, abstract discipline marked a sharp break with the view, prevalent through the eighteenth century, of logic as a language art, or as an epistemological tool in the search for truth. Moreover, Whately's explanations of logical principles were couched extensionally, logical terms being taken as representing classes of objects, not intensionally as representing combinations of attributes. To this extensional setting Boole adjoined a mathematical feature, adapting notions from operator algebra for this purpose. With each class (term) *X* he associated a selection operator, *x*, which selects from a universe of objects those which are *X*. In operator algebra, successive operation is indicated by 'multiplication' (of operators). Hence *yx* selects the *Y* from what *x* selects, that is, from the *X*. As selection in either order results in the same class, he has the 'law',

$$xy = yx$$

Similarly, since a repeated selection of the same class results in nothing new, he has

$$xx \text{ (or } x^2) = x$$

Propositions are represented by equations. The universal affirmative 'All *X* are *Y*', for example, is represented by '$x = xy$' (selection of the *X*s from the *Y*s yields just the *X*s if and only if all *X* are *Y*). The universal negative 'No *X* are *Y*' is represented by '$xy = 0$' (0 representing 'nothing'). Inferences are performed by the substitution and replacement of equals. Thus from '$x = xy$' and '$y = yz$', on replacing *y* in the first equation by *yz* and then the combination *xy* by *x*, one obtains

$$x = x(yz) = (xy)z = xz$$

justifying the validity of the AAA syllogism.

2 *The Laws of Thought*

These few items suffice to illustrate the nature of Boole's initial venture. Seven years later it was supplanted by his more carefully constructed and elaborated *The Laws of Thought* (1854). In a significant change from the earlier work, the symbols $x, y, z, \ldots$ are no longer operations selecting classes but stand directly for the classes themselves. The common understanding of the term class is extended so as to include 'universe' and 'nothing',

these being denoted by 1 and 0 respectively. Unlike '*xy*', defined for any two classes, the combinations '$x+y$' and '$x-y$' are only partially defined: '$x+y$' has meaning only if *x* and *y* have nothing in common, and '$x-y$' has meaning only if *y* is part of *x*. Citing examples from ordinary language for justification, he states a number of laws which hold for classes, such as the two mentioned above, and others such as '$z(x+y)=zx+zy$', for which he gives as an example 'European men and women' is the same as 'European men and European women'.

He contends that for purposes of logical deduction the only verb needed is 'is', or 'are', symbolically expressed by '$=$'. Logical deductions are accomplished by algebraic operations on equations, such as substituting equals for equals. What is new here is a more sophisticated justification for the use of algebra in doing logic, one based on the idea (at that time quite novel) of an algebra different from standard numerical algebra. Commenting on the analogy of his laws of class symbols with those of 'Number', all but '$x^2=x$' being true of numbers, and that also if *x* is restricted to being either 0 or 1, he says:

> Let us conceive, then, of an Algebra in which the symbols $x, y, z, \ldots$ admit indifferently of the values 0 and 1, and of these values alone. The laws, the axioms, and the processes, of such an Algebra will be identical in their whole extent with the laws, the axioms, and the processes of an Algebra of Logic. Difference of interpretation will alone divide them.
>
> (1854: 37-8)

With the adoption of this principle Boole vastly extended the range and applicability of traditional term logic. For - as in numerical algebra - terms of any size or complexity are constructible, resulting in new inference forms unlimited in number. Moreover, as in algebra, transformations on such complex terms can be carried out mechanically by rule, that is, 'computationally'.

But there were difficulties associated with the principle. According to it one may freely use algebraic expressions constructible by use of the binary operators $+$, $-$, $\times$, the (class) variables $x, y, z, \ldots$ and the constants 0 and 1. But then Boole had the problem of what to do with expressions such as '$1+1$' and '$0-1$' to which no meaning was attached. He argued that if the initial algebraic formulas were interpretable in terms of class notions, and if the end result was also so interpretable then the result was valid even if some of the intermediary steps were not. He likened this to the use of the imaginary $\sqrt{-1}$ in trigonometry. With considerable ingenuity Boole introduced procedures which enabled him to obtain correct results.

All this ingenuity became needless when Boole's partially defined addition was replaced by one based on non-exclusive 'or', (as suggested by W.S. Jevons (1864), C.S. Peirce (1867)), so that '$x+x=x$', resulting in what is now called 'Boolean Algebra'. An alternative simplification appeared in the twentieth century. This produced an algebra ('Boolean ring with unit') even closer to Boole's conceptions in having a meaningful subtraction. Here addition is taken to be 'symmetric difference' - what Boole would have written as '$x(1-y)+y(1-x)$' - resulting in the law '$x+x=0$' for this interpretation of addition.

The same algebra that Boole used for the logic of terms he also employed for propositional logic. Now, instead of $x, y, z, \ldots$ standing for classes $X, Y, Z, \ldots$ they stand for 'portions of time' for which propositions $X, Y, Z, \ldots$ are true. Then, for example, '$x=1$' stands for *X* being true (for all time), and '$y=0$' for *Y* not true and '$x(1-y)=0$' for 'If *X* is true, then *Y* is true' (since for no time is *X* true and *Y* not true). In this application, without explicitly realizing it, Boole was adjoining '$x=1$ or $x=0$', a property not necessarily holding for classes and, in effect, reducing his algebra to a special kind of algebra in which there are only two classes.

It will be no denigration of Boole's remarkable achievement in logic if its inadequacies are cited. As already noted, his choice of an addition, incompletely defined for classes, required excessively complicated methods to recover logical content. On the other hand, some of his devices (for example, expansion of a logical function into normal form) became valuable techniques. His treatment of the particular proposition (those involving 'some') was defective, as would be expected since his algebra had no formal means of expressing non-emptiness of a class. He thought his propositional logic had to be based on his logic of terms via the notion of 'portions of time'. Currently the logic of terms is treated as part of the predicate calculus, the development of which *presupposes* propositional logic. Finally, despite Boole's belief that his treatment was fully adequate for all of logic, it did not have the ability to express quantifiers.

Boolean algebra

Boolean algebra, or the algebra of logic, was devised by the English mathematician George Boole (1815-64) and embodies the first successful application of algebraic methods to logic.

Boole seems to have had several interpretations for his system in mind. In his earlier work he thinks of each of the basic symbols of his 'algebra' as standing for the mental operation of selecting just the objects possessing some given attribute or included in some given class; later he conceives of these symbols as standing for the attributes or classes themselves. In each of these interpretations the basic symbols are conceived as being capable of combination under certain operations: 'multiplication', corresponding to conjunction of attributes or intersection of classes; 'addition', corresponding to (exclusive) disjunction or (disjoint) union; and 'subtraction', corresponding to 'excepting' or difference. He also recognizes that the algebraic laws he proposes are satisfied if the basic symbols are interpreted as taking just the number values 0 and 1.

Boole's ideas have since undergone extensive development, and the resulting concept of Boolean algebra now plays a central role in mathematical logic, probability theory and computer design.

1 Basic facts

Boolean algebra, devised by the English mathematician George Boole, embodies the first successful application of algebraic methods to logic (see Boole 1847, 1854).

The algebraic structures implicit in Boole's analysis were first explicitly presented by Huntington (1904), and termed 'Boolean algebras' by Sheffer (1913). As Huntington recognized, there are various equivalent ways of characterizing Boolean algebras. One of the most convenient definitions is as follows. A 'Boolean algebra' is a structure $(B, +_B, *_B, -_B, 0_B, 1_B)$, with *B* a non-empty set, $+_B$ and $*_B$ binary operations on *B*, $-_B$ a unary operation on *B*, and 0_B, 1_B distinct elements of *B* such that the following are true for all x, y, z in *B*.

$$x + (y + z) = (x + y) + z \qquad x * (y * z) = (x * y) * z \qquad \text{(associativity)}$$

$$x + y = y + x \qquad x * y = y * x \qquad \text{(commutativity)}$$

$$x + (x * y) = x \qquad x * (x + y) = x \qquad \text{(absorption)}$$

$$x + (y * z) = (x + y) * (x + z) \qquad x * (y + z) = (x * y) + (x * z) \qquad \text{(distributivity)}$$

$$x + (-x) = 1 \qquad x * (-x) = 0 \qquad \text{(complementation)}$$

(We omit the subscript when confusion is unlikely.) The operations 'Čplus;' (Boolean 'addition' - here corresponding to *inclusive* disjunction), 'Čast;' (Boolean 'multiplication' - intersection) and '$-$' (taking the complement) are called Boolean operations. Note that the operation sending x, y to $x * (-y)$ corresponds to Boole's 'subtraction'. The elements 0 and 1 are called the 'zero element' and 'unit element' of *B*, respectively. We shall usually identify somewhat loosely a Boolean algebra by its underlying set; thus, for example, the Boolean algebra just introduced will be denoted simply by '*B*'.

The following basic identities can be readily shown to hold in any Boolean algebra.

$$-(x + y) = (-x) * (-y) \qquad \text{(De Morgan's laws)}$$
$$-(x * y) = (-x) + (-y)$$
$$-(-x) = x \qquad \text{(double complement law)}$$

We observe that in the axioms characterizing Boolean algebras the roles played by + and *, and by 0 and 1, are entirely symmetrical. This observation leads to the important 'principle of duality' for Boolean algebras which

may be formulated as follows. Let *P* be any statement about Boolean algebras which involves just the Boolean operations +, * and $-$ and the elements 0, 1. The 'dual' of *P* is obtained from *P* by interchanging + with * and 0 with 1. If *P* holds in all Boolean algebras, then so does the dual of *P*. Thus, for example, once we have established one of De Morgan's laws above, the principle of duality leads automatically to the other one.

We define a 'subalgebra' of a Boolean algebra *B* to be a non-empty subset of *B* which is closed under the Boolean operations in *B*.

2 Important types of Boolean algebra

Boole seems to have had several interpretations for his algebraic system in mind. In his original pamphlet (1847) he thinks of each of the basic symbols of his 'algebra' as standing for the mental operation of selecting just the objects possessing some given attribute or included in some given class. Later (1854) he conceives of these symbols as standing for the attributes or classes themselves.

Two standard types of Boolean algebra arise in set theory and logic, corresponding to these two interpretations. To obtain the first of these, consider any non-empty set *X* and let $\wp(X)$ be its power set, that is, the set of all its subsets. Then the structure $(\wp(X), \cup, \cap, -, \emptyset, X)$ is a Boolean algebra - the power set algebra of *X* - in which $\cup, \cap, -$ are the operations of set-theoretic union, intersection and complementation with respect to *X*, respectively.

A subalgebra of a power set algebra is called an algebra of sets. As an example, for any set *X*, let $Z(X)$ be the set of all finite and cofinite subsets of *X* (a 'cofinite' set being the complement of a finite set). Then $(Z(X), \cup, \cap, -, \emptyset, X)$ is an algebra of sets called the finite-cofinite algebra of *X*.

When *X* is a singleton $\{a\}$, $\wp(X)$ reduces to the set $\{0, 1\}$, with $0 = \emptyset$ and $1 = X$. This algebra is called the 'two-element Boolean algebra' and is denoted by '2'. Its operations are displayed in the table below.

x	y	$x+y$	$x*y$	$-x$
0	0	0	0	1
0	1	1	0	1
1	0	1	0	0
1	1	1	1	0

The standard types of Boolean algebra arising in logic are the so-called Lindenbaum-Tarski algebras. To obtain these, we start with a theory *T* in a propositional or first-order language *L*. Define the equivalence relation $\approx$ on the set of formulas of *L* by $\phi \approx \psi$ if $T \vdash \phi \leftrightarrow \psi$. For each formula ϕ let $[\phi]$ be its $\approx$-equivalence class. On the set $A(T)$ of such equivalence classes define the operations +, *, $-$ and the elements 1, 0 by:

$$\begin{aligned} [\phi] + [\psi] &= [\phi \vee \psi] \\ [\phi] * [\psi] &= [\phi \wedge \psi] \\ -[\phi] &= [\neg\phi] \\ 1 &= [\alpha_0 \vee \neg\alpha_0] \\ 0 &= [\alpha_0 \wedge \neg\alpha_0], \end{aligned}$$

where α_0 is a fixed but arbitrary formula. Then the structure $(A(T), +, *, -, 0, 1)$ is a Boolean algebra, called the Lindenbaum-Tarski algebra of *T*. The Boolean algebra $A(\emptyset)$ (which depends solely on the language *L*) is denoted by $Alg(L)$ and is called the Lindenbaum-Tarski algebra of *L*.

Algebras of sets and Lindenbaum-Tarski algebras are typical Boolean algebras in the following sense. Call two Boolean algebras $(B, +_B, *_B, -_B, 0_B, 1_B)$ and $(C, +_C, *_C, -_C, 0_C, 1_C)$ 'isomorphic' if there is a one-one, onto map (that is, an 'isomorphism') $f\colon\ B \to C$ such that $f(0_B) = 0_C$, $f(1_B) = 1_C$ and, for any x, y in *B*,

$$\begin{aligned} f(x +_B y) &= f(x) +_C f(y) \\ f(x *_B y) &= f(x) *_C f(y) \\ f(-_B x) &= -_C f(x). \end{aligned}$$

Then it can be shown that any Boolean algebra is isomorphic both to an algebra of sets and to the

Lindenbaum-Tarski algebra of some propositional theory. (Isomorphic Boolean algebras are structurally indistinguishable.) These facts (the first of which is the famous 'Stone representation theorem' of 1936) together show that Boolean algebras embody just the common structural features of set theory and logic.

Since, as is readily shown, there are Boolean algebras (for example, the finite-cofinite algebra of the set of natural numbers) which are *not* isomorphic to any power set algebra, nor to the Lindenbaum- Tarski algebra of a propositional language, it is of interest to try to determine the additional characteristic features of these two latter types of algebra.

For power set algebras, we need the following concepts. Given a Boolean algebra *B*, we define the relation $\leq$ on *B* by $x \leq y$ if and only if $x * y = x$. It is easily shown that $\leq$ is reflexive ($x \leq x$ for all *x*), transitive (if $x \leq y$ and $y \leq z$ then $x \leq z$) and antisymmetric (if $x \leq y$ and $y \leq x$ then $y = x$); in other words, $\leq$ is a 'partial ordering' on *B*. *B* is then said to be 'complete' if every subset *X* of *B* has both a greatest lower bound and a least upper bound with respect to $\leq$. (It is not hard to see that a *finite* subset $\{x_1, \ldots, x_n\}$ of any Boolean algebra has greatest lower bound $x_1 * \ldots * x_n$ and least upper bound $x_1 + \ldots + x_n$.) An element $a \neq 0$ of a Boolean algebra *B* is called an 'atom' if, for any *x* in *B*, if $x \leq a$, then $x = 0$ or $x = a$. *B* is said to be 'atomic' if for any $x \neq 0$ in *B* there is an atom *a* such that $a \leq x$. Then we have the fundamental result of Lindenbaum and Tarski (1935) characterizing power set algebras: a Boolean algebra is isomorphic to a power set algebra if and only if it is complete and atomic (see Halmos 1963: §16, theorem 5).

Turning to Lindenbaum-Tarski algebras of propositional languages, we define a subset *X* of a Boolean algebra *B* to be 'free' if for any finite subset $\{x_1, \ldots, x_n\}$ of *X* we have $y_1 * \ldots * y_n \neq 0$, where each y_i is either x_i or $-x_i$. *X* is said to 'generate' *B* if the only subalgebra of *B* containing *X* is *B* itself, that is, if every element *b* of *B* can be expressed in the form $b = y_1 + \ldots + y_n$, where each y_i is of the form $z_1 * \ldots * z_m$ with either z_i or $-z_i$ in *X*. Finally *X* is said to be 'freely generated' if it has a free set of generators. It can then be shown that, for any propositional language *L*, the algebra $Alg(L)$ is freely generated (with the equivalence classes of the proposition letters constituting a free set of generators) and, moreover, that any (infinite) freely generated Boolean algebra is isomorphic to some $Alg(L)$.

3 Boolean algebras as algebras of truth-values

The simplest Boolean algebra is the algebra $2 = \{0, 1\}$, which it is customary to think of as the algebra of two 'truth-values'; 0 standing for False and 1 for True. More generally, we may conceive of an arbitrary Boolean algebra as an algebra of 'generalized truth-values' - that is, containing elements corresponding to 'truth-values' different from True and False. In that case, it becomes natural to extend the usual idea of truth-valuations of (propositional) formulas (that is, in the algebra 2) to valuations in arbitrary Boolean algebras. Thus we define a 'valuation' of a propositional language *L* in a Boolean algebra *B* to be a map *v* from the set of formulas of *L* to *B* such that, for arbitrary formulas ϕ, ψ we have

$$v(\phi \vee \psi) = v(\phi) + v(\psi)$$
$$v(\phi \wedge \psi) = v(\phi) * v(\psi)$$
$$v(\neg\phi) = -v(\phi).$$

It can then be shown that, for any formula ϕ, the following assertions are equivalent:

(1) ϕ is a propositional theorem.
(2) $v(\phi) = 1$ for every valuation *v* in 2.
(3) $v(\phi) = 1$ for any valuation *v* in any Boolean algebra.

(The equivalence between (1) and (2) is the completeness theorem for propositional logic.) A similar result may be established for predicate logic (extending the relevant completeness theorem), this time using the idea of a valuation in a complete Boolean algebra to enable quantified formulas to receive 'truth-values'.

The idea of using Boolean algebras as algebras of truth-values scored what is regarded by logicians as its most spectacular success in the 1960s when it was shown by Robert Solovay and Dana Scott, and independently by Petr Vopenka, that Paul Cohen's celebrated proofs of independence in set theory could be formulated in terms of what has come to be known as the method of 'Boolean-valued models' (see Bell 1985). Briefly, the method runs as

follows. Let *L* be the language of Zermelo-Fraenkel set theory (ZF; see Set theory, different systems of), and suppose that σ is a sentence of *L* whose formal independence of ZF we wish to establish - the continuum hypothesis, for example (see Continuum hypothesis). A complete Boolean algebra *B* is chosen and a class $V^{(B)}$ of sets - the Boolean universe induced by *B* - constructed. Let $L^{(B)}$ be the language obtained by adding to *L* a name for each element of $V^{(B)}$. Now one can construct a 'valuation' *v* of the (sentences of) the language $L^{(B)}$ in *B*: for each sentence ϕ of $L^{(B)}$, $v(\phi)$ is the element of *B* representing the 'Boolean truth-value' of ϕ in $V^{(B)}$. This map *v* is defined so as to map all the theorems of ZF to the unit element 1 of *B*: accordingly the 'structure' $(V^{(B)}, v)$ is called a Boolean-valued model of set theory. If the Boolean algebra *B* is chosen with finesse, it is possible to arrange things so that $v(\sigma) = 0_B$. That is, for a suitable choice of *B*, $V^{(B)}$ is a Boolean-valued model of set theory in which the given statement σ is false. This amounts to a proof of the independence of σ from the axioms of set theory. It follows that the problem of establishing the independence of a particular set-theoretic statement boils down in principle to demonstrating the existence of a complete Boolean algebra with specified properties. This method has been exploited with great success in recent years.

Bosanquet, Bernard (1848-1923)

One of the most prominent and prolific of the British Idealists of the late nineteenth and early twentieth centuries, Bosanquet ranged across most fields of philosophy, making his main contributions in epistemology, metaphysics, aesthetics and especially political philosophy. He was deeply influenced by Plato and byHegel. Bosanquet and F.H. Bradley were close on many matters, and each regarded the other as a co-worker; however, Bosanquet was always more Hegelian, less rigorous in argument than Bradley and lacking his sceptical approach. Bosanquet treats knowledge and reality as a single whole, working out the implications in the concrete 'modes of experience' of philosophy, science, morality, art, religion, and social and political life. He is at his best in explaining and developing the thoughts of others, particularly ofHegel, Bradley, Rousseau and T.H. Green.

Bernard Bosanquet was educated at Harrow and Balliol College, Oxford. He was much influenced by Green's philosophy, and by his example of active citizenship (see Green, T.H. §3). Elected a fellow of University College in 1870 (beating F.H. Bradley), Bosanquet taught philosophy and Greek history. He resigned in 1881 in order to have time to write and to engage in social work with the Charity Organisation Society in London; he was also a frequent adult education lecturer and organizer. He was professor of moral philosophy at St Andrews University in the years 1903-8.

Bosanquet propounds a version of absolute or objective idealism derived principally from Hegel. The key to Bosanquet's general metaphysics is 'the whole'. Our knowledge is always of particular parts of experience conceived in a particular way (scientific, aesthetic, religious, and so on); hence our judgments may conflict (for instance, the findings of science and religion). But what we experience as parts are in reality interrelated and constitute a whole, which reveals its different aspects in the different concrete forms of our experience. So all our knowledge is partial, inconsistent, incomplete and not fully true; we strive to unify it. Complete knowledge, or truth, would be comprehensive and systematic knowledge of the all-inclusive and self-consistent and coherent whole (or Absolute), and thus of every part in all its relations to every other part. The Absolute is not transcendent, in 'another' world, but immanent here in ours. Our knowledge rests on experience of appearances of reality.

Correspondingly, individual parts of the whole, for example, an animal, a work of art, or a person, are not completely real; only the whole of which they are part is real. Ultimately there is but one true, real, individual: namely, the whole. It follows that persons, for example, are 'finite individuals', incomplete and not as real as the communities to which they belong (which in turn are not fully real, relative to the whole). Reality and value are not found to the full in individual persons. Bosanquet drew the controversial conclusions, for example, that the traditional belief in an immortal soul peculiar to each person is groundless, a symptom of our mistaken religious individualism. He is not denying the separateness and uniqueness of persons: each is a particular 'modification' of the social whole. But each becomes more real by drawing on the ideas and institutions of their society. True individuality is judged not by the atomic and exclusive self, nor by what persons are, but by what they can become, and that is shown in their society and its cultural achievements.

Bosanquet's approach shows to advantage in his political philosophy. It arms him against the atomic individualism he finds in the 'theories of the first look' of Bentham, Spencer andJ.S. Mill. Instead, combining Rousseau andHegel, Bosanquet argues that the individual members of a state are linked together by their common ideas and through their participation in its institutions. Taken as a whole, they each have a 'general will', aiming at the common good, which is more real than their particular wills; and their freedom lies in acting according to the general will, as expressed in the law and practices of the state. Bosanquet also takes account of the various levels and kinds of groups (finite wholes) in a state: families, professions, trade unions, churches, local communities, for instance. He shows how these interact, how they express different and sometimes conflicting interests, and how the sovereign state harmonizes their demands. He is thus able, in later editions of *The Philosophical Theory of the State*, to incorporate the arguments of the Pluralists. He explains how change is effected in the state and in its component parts as ideas clash and are reconciled through a 'social logic'. This analysis works particularly well in the case of a parliamentary democracy. Bosanquet is no conservative. Because the Absolute is immanent, improvement is not postponable to another world: 'here or nowhere is your America', 'the Kingdom of God is on earth'. Not everything is as it should be; and the state should sometimes be used confidently to widen persons'

opportunities. The state is justified in restricting its members' narrow freedom from interference because its laws are in the interest of all, and bring greater freedom, the freedom to develop oneself. The state is more real than the person, the whole in which the person can enrich their life (but Bosanquet in no way considered the value of persons to be instrumental to the state). The state too is finite, in relation to other states. Bosanquet did not think the political conditions for international federations or world government existed yet, but there is space for it in his theory. The state is also finite relative to the deeper experience of religion, art and philosophy, which enable persons to enlarge their individuality.

Bosanquet suffered severely from Hobhouse's not altogether fair but very effective attacks on him as being politically authoritarian, confusing the state with society and idealizing actual states. Generally Bosanquet's style of philosophizing became unfashionable: Russell, for example, found it vague, loose, shallow, evasive, dogmatic and claiming more for philosophy than it could deliver. For most of the twentieth century Bosanquet has been ignored. It remains to be seen whether his ties to Hegel will benefit him as Hegel's reputation rises again.

Bourdieu, Pierre (1930-)

Critically assessing both hermeneutic and structuralist approaches, Pierre Bourdieu's social theory aims at transcending the opposition between the individual and society. On the one hand, people exhibit practical skills which are adjusted to the constraints of the environment. On the other hand, society does not determine people's actions: the very same practical skills allow them to improvise and deal with an infinite number of situations. Although Bourdieu takes into account the individual, he does not succumb to the Cartesian notion of a self-sufficient subject. Also, his view is very much in opposition to rational choice theory. His theoretical framework has emerged out of his empirical research and vice versa. In his research Bourdieu applies his reflexive sociology: a critical reflection on the part of the social scientist towards their own practices.

Initially educated at the École normale supérieure and eventually Professor of Sociology at the Collège de France, Bourdieu is known for his contributions to the theory of society. The label 'social theorist' is, however, not entirely appropriate. First, his writings cover various fields in the social sciences, ranging from the abstract to the ethnographic. Second, rather than providing a theory that is independent of empirical research, Bourdieu aims at a method derived from and directed towards social research. Rather than embarking upon a grand theory, Bourdieu invites the reader to ask certain questions.

Pierre Bourdieu spent most of his academic life in France, apart from a short spell in Algeria. It is thus not surprising that many of his writings deal with French society. Neither is it far-fetched to read some of his writings as a dialogue with Sartre and Lévi-Strauss - the two leading French intellectuals at the time of Bourdieu's formative academic years (see Sartre, J.-P.; Lévi-Strauss, C.). Always sceptical of existentialist philosophy, Bourdieu was initially attracted to structuralism but soon also distanced himself from the latter (see Structuralism in social science §5). Where existentialism lacks objectivity, structuralism erroneously dismisses the relevance of hermeneutics (see Hermeneutics). Related to his critique of both philosophies, Bourdieu's project has been to transcend the opposition between the individual and society. However, Bourdieu's attention to the agent does not mean that he succumbs to a Cartesian notion of a self-sufficient subject; instead Bourdieu adopts some of the phenomenological and Wittgensteinian insights *vis-à-vis* shared, tacit knowledge (see Phenomenological movement; Phenomenology, epistemic issues in; Wittgenstein, L.). Likewise, his focus upon social structure does not entail the 'economism' of French Marxism. Indeed, Bourdieu pays much attention to power struggles in society, not merely at the economic level, but also in the symbolic sphere (see Marxist philosophy of science).

In spite of his reluctance to build a consistent theoretical system, Bourdieu's writings exhibit a particular philosophical outlook. He describes his own work as an attempt to transcend the alleged dualism between what he calls 'objectivism' and 'subjectivism'. Characteristic of structuralist perspectives, objectivism searches for underlying structures independent of people's knowledge or strategies. Central to humanist approaches, subjectivism attributes a pivotal role to people's experiences, strategies and improvisations. Focusing on one side only, each perspective inevitably distorts reality. Subjectivist accounts tend to conceive of social life as created *de novo* by individuals, failing to acknowledge the internalization of societal constraints within the individual. Objectivism tends to adopt a mechanistic model of human action, and fails to recognize that social life is a practical achievement of competent individuals. It mistakenly reduces the complexity of practices to a coherent and simplified cultural logic. Hence Bourdieu's argument for 'objectifying the act of objectification' implies that the researcher, while observing and objectifying, takes a similar critical distance towards the objectification itself. Bourdieu's proposal for 'participant objectivation' attempts to objectify the object of research, examine the validity and presuppositions of that objectification, and finally to take into account people's skilful achievements. Relatedly, the practices of the social scientist in general are embedded in structural conditions and power struggles themselves. Hence Bourdieu's 'reflexive sociology' aims at a critical distance regarding its own practice.

Central to Bourdieu's view is people's practical mastery of the logic of everyday life. Most of the time people know how to go on in their daily activities, without needing to formulate that knowledge discursively. This practical knowledge is thus not part of the realm of consciousness, nor is it, strictly speaking, unconscious. People's practical logic relies upon *doxa* or 'doxic experience', that is, the taken-for-granted nature of people's daily existence. Both practical logic and *doxa* are central to Bourdieu's concepts of *'habitus'*, 'strategy' and

‘field’. *Habitus* refers to an acquired generative scheme of dispositions. These dispositions are tacitly acquired in early childhood, and, once inculcated, they endure. Dispositions generate practices, perceptions or bodily *‘hexis’*, adjusted to the constraints of the social world in which the *habitus* has emerged. Hence different social backgrounds will produce a different *habitus*. The *habitus* provides a ‘feeling for the game’. It makes it possible for people to develop any number of strategies attuned to an infinite number of situations. The external social world consists of ‘fields’: that is, areas where, through strategies, struggles take place over goods or resources (capital). Fields are not restricted to struggles over economic capital: they might also deal with social capital (contacts and acquaintances), cultural capital (education, culture and related skills) or symbolic capital (distinction and prestige). Although Bourdieu’s use of ‘capital’ suggests that interests are at stake, these are not necessarily material, nor do individuals normally adopt a conscious calculative orientation towards them.

Bourdieu has been criticized mainly for his alleged lack of analytical precision and for his tendency to read too much into his empirical material. Although there is some truth in both criticisms, neither affects the core of Bourdieu’s frame of reference. In this context, his strengths reveal his weaknesses. Bourdieu’s incisiveness lies in accounting for the reproduction of society, as becomes apparent in his notion of skilful, unquestioned reproduction of structures or in the presupposition that the *habitus* tends to be adjusted to social constraints. One of the upshots of this is that Bourdieu pays less attention to the ability of individuals to distance themselves from the facticity of daily existence - the ability to turn tacit knowledge into theoretical knowledge. Bourdieu tends to do so only in so far as people’s distancing towards everyday life is a result of social scientific intervention. He thereby fails to acknowledge fully that people may also exhibit that ability for distancing in the absence of scientific interference. If people’s theoretical knowledge enters the public-collective realm, it might become an important source of change or deliberate maintenance of structures.

Boutroux, Émile (1845-1921)

The French philosopher Émile Boutroux wanted to reestablish metaphysics in the face of a growing tendency towards materialism, but without rejecting the natural sciences. He hoped to achieve this by showing that only an immaterial mind that is a free and final cause of everything that is determined can give an absolute foundation to the sciences and to nature. Scientific determinism, according to which all phenomena are governed by mathematical necessities, is not incompatible with freedom. Indeed, the contingency of things and of human reason, which one sees in scientific experience, shows that the mind is free; it is therefore only mind which can give a determined existence to things and necessity to scientific explanations. In trying to reconcile metaphysics and science through a philosophy of nature, Boutroux represents a major turning point in French spiritualism, foreshadowing not only Bergson but also Bachelard.

Boutroux defended his thesis *De la contingence des lois de la nature (On the contingency of the laws of nature)* in 1874. Having taught at the École Normale Supérieure, among other places, he moved to the Sorbonne, where he became Professor of the History of Modern Philosophy in 1888. As a member of the Academy of Moral and Political Sciences and of the Académie Française, he was one of the important thinkers of his time. He was a former pupil of Jules Lachelier and participated in a brilliant and original way in the growing renewal of spiritualist thought brought about by Ravaisson from the end of the Second Empire. As free from the declining eclecticism as he was hostile to scientific materialism, Boutroux upheld a rationalism influenced by Leibniz that tried to include elements of British empiricism and the positivism of Comte. He studied Aristotle, Descartes and Kant, but concentrated on German philosophy of the seventeenth century, and above all on Leibniz, whose *Monadology* and *New Essays on Human Understanding* (First book) he translated into French. His lecture courses on natural law, given in 1892-3, contain a critique of scientific rationalism through which he returned to the metaphysical position put forward in his thesis of 1874.

As a historian of philosophy,Boutroux denounced the Hegelian philosophy of history and its introduction into France by Victor Cousin (see Hegelianism §4). He did not want to judge works dogmatically in looking for a successive development of an immanent spirit in history. As history is not a system in which the historian is required to uncover a teleological regularity under the particularities, Boutroux practised a critical study of philosophies taken in themselves as individual. Without neglecting the historical context, he attempted to make clear the acts of free creativity that throughout history have led philosophers to return time and again to the great problems of metaphysics.

Boutroux's philosophy of nature gives meaning to this conception of history. In it he criticizes the modern idea of natural law and its regulating principle of determinism, according to which everything is governed by necessary mathematical relations. According to Boutroux, laws are contingent because the relations they establish are never entirely a priori, and because reality is incommensurable and irreducible to mathematical necessity. As mathematics is applied to experience, the laws become more determinate and particular, and thereby less necessitating. It is an error of scientism to confuse determinism with necessitarianism. Science, in its effort to reduce experience to the mathematical, loses its sense of the radical contingency at work in nature; it generalizes and takes things to extremes in transforming its useful regulative idea into a constitutive principle of nature.

This philosophy of science foreshadows certain ideas that are present both in Bergson's metaphysics andBachelard's epistemology (see Bachelard, G. §2; Bergson, H.-L. §5). For example, there is the empiricist idea, taken fromRavaisson and developed by Bergson, according to which scientific laws are habits of reproduction that assimilate reality to our minds so that we may act on it, but which only partially correspond to how things are. There is also the idea that scientific rationalism proceeds by using an artificial construction of experience without which it would never be able to apply itself; and that the specialization of the sciences results in an irreducible pluralism of local determinisms; ideas which Bachelard developed in more radical and unforeseen ways. Nevertheless, it is metaphysics that he wants to save, as much from being dissolved by science as from being divorced from it. Boutroux wanted to retain rationalism without falling either into scientism, or into the illusion denounced by Kant as the transcendental use of the laws of nature, or into the dangerous error of separating the deterministic natural world from the intelligible world of freedom, as Kant did (see Kant, I. §§8, 9). It is in his

reading ofAristotle, and still more of Leibniz, that Boutroux tries to reconcile determinism and freedom, in showing that mechanism presupposes finality. Contingency - which is not chance but determination through a *telos* (life), and, from the human point of view, determination by the idea of progress - is presupposed by determinism, because it is incapable of giving an account of it.

This movement that reaches above science to metaphysics is completed in a moral reflection on the relation between science and faith. Boutroux shows that, as human beings are conscious living things irreducible to mechanism, there is no contradiction between science and religion. Science presupposes not only a reality that extends beyond what it can assimilate, but also that the human mind goes beyond the intellectual faculties it employs. Both outside and inside us, it presupposes a creative vital force that, in human beings, implies faith, the ideal and love, the three principles of all religions. Religious works, dogmas and rites are neither adventitious for religion nor unjustifiable for reason, even if religion is a matter of feeling and if its truth, as it would be developed by Bergson, is a mystical sentiment. Thus it is once again a matter of demonstrating the possibility of a spiritualism that goes beyond the scientific outlook without opposing it.

Bowne, Borden Parker (1847-1910)

Bowne was one of the most influential thinkers and writers of the American personalist school of philosophy. His position is theistic and idealistic, and finds in human persons the key to meaning in the world. Knowledge comes only through personal experience, through which we understand ourselves to be enduring thinking entities with a certain degree of freedom. The uniformity of God's activity is such as to make nature intelligible to us, but our minds are nevertheless independent of God's.

Borden Parker Bowne was born in a New Jersey manse and educated at Pennington Seminary, New York University and in Europe (chiefly Paris, Halle and Göttingen). He taught at Boston University from 1876 to 1910, serving as the first dean of the graduate school. His views were strongly influenced by the ideas of Kant, Lotze (with whom he studied) and Bergson. He was ordained in the Methodist Episcopal Church as a local preacher in 1872 and an elder in 1882. During a long career of teaching and publishing he became the most influential exponent of American personalism, a philosophical school of which he was arguably the founder.

Bowne held that the basis for knowledge is personal experience: 'For each person, his own self is known in immediate experience and all others are known through their effects' (1902: 269). If the world is intelligible, there is continuity that underlies the flux of human experience; in self-consciousness, one is aware of various sensory and introspective phenomena that are unified in that they are objects of a single awareness. In memory, one recognizes the identity of one's current centre of awareness with prior centres. Thus one finds in oneself the continuity of a mental substance; one knows oneself as an enduring, thinking thing. One also experiences a measure of self-control, so that purposive action is possible, feelings can be controlled, and competing ends assessed; we find that we have a relative independence of our environment and of others. But we also experience a degree of dependence on our environment and on others that makes it clear that our independence is only relative. Bowne held that these facts are incontrovertible, and that no philosophy can be adequate that denies or ignores them.

One thing Bowne believed these facts to rule out is any view in which the thoughts and feelings that some or all human beings experience are really the thoughts and feelings that God has in or through them. Such a view is incompatible with both our relative independence (we are self-directing agents, not mere passive receivers or conduits) and our relative dependence (God cannot be dependent). These facts, even without further appeal to such things as our having false beliefs and our performing wrong actions, make it clear that no notion that our consciousness is really part of God's consciousness is defensible. Thus God is not to be thought of along the lines of 'the collection of all finite minds'; rather God possesses an independence and freedom on which our relative independence and freedom is modelled.

Bowne's view was that the sort of absolute idealism for which each human mind is somehow part of a cosmic mind, and the deterministic materialism for which mind reduces to matter, while at opposite ends of the metaphysical spectrum, are alike in certain of their most important consequences. Leaving no room for free human agency, both are incompatible with human responsibility. Both make evil action impossible: the former by making God the only agent, and the latter by allowing for no agents at all but only mechanistically produced effects.

Bowne had no difficulty in accepting evolutionary theory, and viewed the evolutionary process as directed by God so as to produce human beings. As a metaphysical idealist, he held that one's body at any particular time is simply a collection of one's sensory images, and over time is but a series of such collections. The bodies of persons are images that they do not create, and the laws of nature are descriptions of the uniformity of God's activity in causing our perceptual images. Since God's willing is rational, what we call 'nature' is intelligible. This makes science and planned practical activity possible. One consequence of this sort of view is that 'existing in this world' is a matter of having perceptual and introspective experiences of a familiar, if not easily characterized, form and type. Thus 'existing in another world' would be a matter of having perceptual and introspective images of a significantly different form and type. A complete world will be composed of various such 'worlds' and will exist within a single divine purpose, being unified in that each 'world' occurs within the framework of a single coherent divine plan that assures 'fit' between them.

Boyle, Robert (1627-91)

Boyle is often remembered for the contributions that he made to the sciences of chemistry and pneumatics. Like other natural philosophers in seventeenth-century England, however, he was a synthetic thinker who sought to advance knowledge in all areas of human concern. An early advocate of experimental methods, he argued that experimentation would not only reveal the hidden processes operative in the world but would also advance the cause of religion. Through the study of nature, experimentalists would come to understand that the intricacy of design manifest in the world must be the result of an omniscient and omnipotent creator.

Boyle's experimental investigations and theological beliefs led him to a conception of the world as a 'cosmic mechanism' comprised of a harmonious set of interrelated processes. He agreed with the leading mechanical philosophers of his day that the corpuscular hypothesis, which explains the causal powers of bodies by reference to the motions of the least parts (corpuscles) of matter, provided the best means for understanding nature. He insisted, however, that these motions and powers could not be known by reasoning alone, but would have to be discovered experimentally.

1 Life and works

Robert Boyle, born 1627 at Lismore Castle, Ireland, was the youngest son of the first Earl of Cork, one of the wealthiest members of the English aristocracy. Boyle's formal schooling was limited to four years at Eton (1635-9) after which he embarked upon a tour of Europe. He read the works of Galileo while visiting Florence, and studied the classics, languages, Calvinist theology and Epicurean philosophy during an extended stay in Geneva. Upon the death of his father in 1644 he returned to England and resided in London with his sister Katherine, Lady Ranelagh, through whom he met a number of leading educational theorists, mechanical philosophers and chemists such as Samuel Hartlib, John Milton, Kenelm Digby and Benjamin Worseley.

In 1646 Boyle retired to his inherited estate at Stalbridge where he wrote moral and theological essays, compiled catalogues of medicinal remedies, and began experimental studies in chemistry and anatomy. He moved to Oxford in 1655 in order to work with an informal group of experimentalists meeting there that included Robert Hooke, John Locke and Christopher Wren. While at Oxford he also associated with theologians and linguists such as Thomas Hyde, Samuel Clarke and Thomas Barlow, and he became involved in a number of business ventures including the Hudson's Bay Company and the East India Trading Company. In 1665 he received an honorary medical degree from Oxford. In 1668 he returned to London and lived there with his sister until both of them died, a week apart, in December 1691.

Boyle gained international recognition with the publication of his first major scientific work, *New Experiments Physico-Mechanical, Touching the Spring of the Air* (1660), in which he reported a series of experiments performed with an air-pump designed to support the notion of the weight of the air developed by Pascal and Torricelli and his own conception of the spring (elasticity) of the air. His work was seen by many as a significant improvement upon earlier Aristotelian speculations, yet it was also severely criticized, by Henry More and Thomas Hobbes among others. In 1662 he published responses to his critics in a second edition of *New Experiments* that also contained the first formulation of Boyle's law, which describes the inverse proportion between the pressure and volume of a gas.

Boyle's interests were broad and eclectic and his inherited wealth provided him with the leisure to pursue many areas of study. During his lifetime he published over forty works ranging from comprehensive experimental histories to defences of the Christian religion and the new corpuscular philosophy. In one of his last books, *The Christian Virtuoso* (1690), he explained that such eclecticism was warranted because ' true philosophy' is 'of greater extent, than the hypothesis of any one sect of philosophers, being indeed a comprehension of all the sciences, arts, disciplines, and other considerable parts of useful knowledge'.

2 Experimental philosophy

Boyle first became acquainted with the Baconian concept of useful knowledge through his association with the Hartlib group in London, and his own laboratory investigations, particularly in chemistry, increased his conviction that experimental practices would be required to improve upon what he perceived to be the 'barrenness' of the

natural philosophy taught in the schools. He agreed with Bacon that the Aristotelian distinction between natural and artificial processes was not tenable and that the experimental manipulation of natural bodies could yield more than immediate utilitarian benefits (see Bacon, F.). As Boyle explained in his *Usefulness of Experimental Philosophy* (1670), the production of effects under the controlled conditions of a laboratory may 'either hint to us the causes of them, or at least acquaint us with some of the properties or qualities of things concurring to the production of such effects'.

Although he designed his experimental method as a way by which to learn about the causal processes operative in nature, he opposed what he found to be the premature theoretical systems of many of his contemporaries. In *The Sceptical Chymist* (1661), for example, he produced experimental refutations of the prevalent Aristotelian and alchemical theories of elements, but he offered no theoretical account of his own with which to replace them (see Alchemy; Natural philosophy, medieval §1). In other works where he did speculate about the causal powers of bodies, his discussions were tentative and hesitant. Boyle's caution was in part a result of the many practical problems that he encountered in his laboratory. His reflection upon the epistemological significance of these 'contingencies of experiment' led him to write one of the earliest and most complete accounts of the systematic errors associated with experimental practice.

In his *Certain Physiological Essays* (1661), Boyle discussed how the use of impure ingredients, imperfect instruments or inappropriate techniques could lead to experimental failure. To mitigate the effects of systematic error, he designed a number of methodological strategies. Some were meant for specific areas of investigation, such as the indicator tests that he developed for the identification of acids and alkalies. Others, such as repetition and variation, were offered as general strategies to be used for all areas of investigation. In order to establish that an experimental result provides reliable evidence about a natural process, one has to ensure that it is not an artefact of the particular materials or instruments used in its production. Not only is it necessary to repeat experimental trials and vary their circumstances, it is also necessary to publish complete accounts of experiments so that others will be able to repeat the trials for themselves or at least judge the appropriateness of the experimental conditions and the soundness of any inferences drawn from them. Boyle's practical implementation of his programmatic methodological statements can be seen in the experimental histories that he wrote on *Colours* (1664), *Cold* (1665), *Blood* (1684) and *Air* (1692).

Unlike the stress upon individual reasoning found in the Scholastic and Cartesian philosophical traditions, Boyle insisted that collaboration and cooperation among naturalists were necessary for the advancement of knowledge. This belief was a product of his methodological dictates as well as a consequence of his view concerning the justification of theoretical speculations. According to Boyle, a theory is acceptable only after a 'concurrence of probabilities' has been produced whereby all of the relevant and available evidence supports a particular conclusion.

Experimentation should 'beget a confederacy, and an union between parts of learning', because often more than one area of investigation would be required to learn about a natural process. A full understanding of the circulation of the blood, for example, had required the efforts of workers whose areas of expertise were in physiology, anatomy, chemistry and mechanics. As he explained in his *Usefulness of Natural Philosophy* (1664), there is a 'dependency, continuation, and confederacy of causes' in nature that results from the 'secret correspondencies and alliances' between things. This ontological conception was supported by his experimental work as well as by his theological worldview.

3 Theology

In addition to being an experimentalist, Boyle was also a lay theologian who emphasized the importance of revealed religion. In *The Excellency of Theology* (1674) he argued for the intellectual superiority of scriptural studies over natural philosophy and early in his career he published a work on what we would today call biblical hermeneutics, *The Style of the Holy Scriptures* (1661), that is significant for understanding his views on interpretation. According to Boyle, the 'seeming contradictions' identified by critics of the Bible are the product not of its divine author but 'of our ignorance'. The Bible is a complex interrelated whole that must be 'coherent' because God would not require humans to believe inconsistencies. The proper method of interpretation, therefore, would require that readers attempt to eliminate apparent contradictions by a gradual process of reconciliation.

In *A Free Inquiry into the Received Notion of Nature* (1686), Boyle discussed how nature could also be described as a divine text because it is composed of a complex set of interrelated parts all of which were designed by God to produce one coherent whole. The relations that obtain in nature are the 'result of the universal matter, or corporeal substance of the universe, considered as it is contrived in the present structure and constitution of the world, whereby all bodies, that compose it, are enabled to act upon, and fitted to suffer from one another'. In anticipation of Leibniz, Boyle discussed the perfection of the world and maintained that there is an 'intercourse and harmony between truths'. Naturalists must attempt to discover the 'connection of physical truths, and the relations that material bodies have to one another' and thus the interpretation of nature would require the same type of reconciliation process that he had recommended for the Scriptures.

Boyle criticized the Cartesians and atomists who excluded considerations of final causality from their philosophical systems because he believed that the investigation of nature provided one of the best means for learning about its creator. In his *Disquisition about the Final Causes of Natural Things* (1688), he argued that God may 'declare truths to men, and instruct them, by his creatures and his actions, as well as by his words'. The study of nature could thus lead an experimentalist to the 'acknowledgement of the divine Architect's power, wisdom and beneficence'. He did agree with his contemporaries' criticisms of Aristotelian teleology, however, and he maintained that it was not legitimate to refer to God's purposes when explaining physical processes. Yet some appeal to God's initial act of creation could provide a valuable heuristic for natural investigations. Indeed, his conception of the coherence of the world guided his specific formulation of the corpuscular hypothesis and his belief in the omniscience of the creator led him to insist that corpuscular explanations could not be justified by a priori reasoning, but would require experimental proof.

4 Corpuscular hypothesis

In his 'Excellency and Grounds of the Mechanical or Corpuscular Hypothesis' (1674) Boyle argued that corpuscularianism was simpler and more intelligible than the alternative Aristotelian doctrine that appealed to the occult qualities and substantial forms of bodies. In his *Origin of Forms and Qualities* (1666) he also defended a mechanical account of nature by which physical phenomena were to be explained by considering 'only the size, shape, motion (or want of it), texture, and the resulting qualities and attributes of the small particles of matter'. These arguments were similar to those of other mechanical philosophers. Boyle's extensive experimental practice and his interest in the chemical composition of bodies led him to reject what he saw to be the purely quantitative and mathematical analysis of Descartes, however, and to advocate a more qualitative approach to the study of nature. According to Boyle, it is the set of qualities possessed by a body that defines its essence and gives it the causal power to produce changes in other bodies. He developed an account of the primary and secondary qualities of bodies, which would receive further elaboration and refinement in the philosophical writings of John Locke, in order to describe how corpuscular explanations would allow for a qualitative understanding of physical phenomena (see Locke, J. §4; Primary-secondary distinction §1).

Primary qualities are those 'affections', such as size and shape, that must belong to all parts of matter. Secondary qualities, on the other hand, are those properties of bodies such as colour and temperature that result from the internal configuration of the parts of matter of which they are composed as well as the external relations that they have to other bodies. Boyle maintained that these secondary qualities ' do as well seem to belong to natural bodies generally considered, as place, time, motion and those other things… treated of in the general part of natural philosophy'. Although the secondary qualities of bodies are causally responsible for human sensations, they are not 'like to the ideas they occasion in us'. Heat, for example, is a product of the rapid motion of the particles composing a body, such as the sun. The sun has the secondary quality of heat that gives it the power to produce the sensation of heat in a human, but even if all 'sensitive beings in the world were annihilated' the sun would retain its secondary quality and thus continue to have the power to affect other bodies such as ice and wax.

In *The Mechanical Origin or Production of Divers Particular Qualities* (1675), Boyle reported experiments that he had performed to show how secondary qualities could be added to or taken away from bodies simply by a mechanical alteration of their structure. Repeatedly striking a metallic body with a hammer will cause it to become hot, for example, whereas a piece of glass operated upon in the same way will lose its transparent quality and be reduced to a white powder. Although this work helped to establish the feasibility and intelligibility of mechanical explanations, Boyle was never able to specify the ultimate causal mechanisms responsible for the effects that he

produced in his laboratory. His lack of theoretical success may be attributed to his overly cautious attitude that resulted from his appreciation of the fallibility of experimental practice and the complexity of natural processes, as well as to his eclectic and comprehensive approach whereby he sought to combine researches in physics, chemistry and biology. His works are of lasting historical significance not so much because of the specific theories that he developed but because of his successful promotion of a new way of thinking about nature and a new method for investigating physical processes. A self-proclaimed 'underbuilder', he provided the materials and methods that later thinkers such as Newton and Lavoisier would use to great advantage (see Newton, I.; Chemistry, philosophical aspects of §3).

The individual essays cover Boyle's experimental, philosophical and theological works as well as his intellectual and social context. Contains a complete bibliography of all works published on Boyle between 1940 and 1993.)

Jacob, J.R. (1977) *Robert Boyle and the English Revolution*, New York: Franklin. (Speculates about the political motivations behind Boyle's scientific and religious views based upon early manuscript material and the known political ambitions of some of Boyle's associates.)

Maddison, R.E.W. (1969) *The Life of the Honourable Robert Boyle*, New York: Barnes & Noble.(The most definitive life of Boyle, corrects some errors contained in Birch's account as well as supplementing it with material from the private papers of Boyle's relations.)

Sargent, R.-M. (1995) *The Diffident Naturalist: Robert Boyle and the Philosophy of Experiment*, Chicago, IL: University of Chicago Press.(An analysis of Boyle's development and practice of experimental methodology from a philosophical perspective.)

Shapin, S. and Schaffer, S. (1985) *Leviathan and the Air-pump: Hobbes, Boyle, and the Experimental Life*, Princeton, NJ: Princeton University Press.(Discusses the controversy surrounding Boyle's pneumatic experiments primarily from the point of view of his critics, and focuses upon the political implications of the debates.)

Wojcik, J.W. (1997) *Robert Boyle and the Limits of Reason*, Cambridge: Cambridge University Press.(Examines Boyle's theological and philosophical works in the historical context of the religious debates in seventeenth-century England.)

Bradley, Francis Herbert (1846-1924)

Bradley was the most famous and philosophically the most influential of the British Idealists, who had a marked impact on British philosophy in the later nineteenth and earlier twentieth centuries. They looked for inspiration less to their British predecessors than to Kant and Hegel, though Bradley owed as much to lesser German philosophers such as R.H. Lotze, J.F. Herbart and C. Sigwart.

Bradley is most famous for his metaphysics. He argued that our ordinary conceptions of the world conceal contradictions. His radical alternative can be summarized as a combination of monism (that is, reality is one, there are no real separate things) and absolute idealism (that is, reality is idea, or consists of experience - but not the experience of any one individual, for this is forbidden by the monism). This metaphysics is said to have influenced the poetry of T.S. Eliot. But he also made notable contributions to philosophy of history, to ethics and to the philosophy of logic, especially of a critical kind. His critique of hedonism - the view that the goal of morality is the maximization of pleasure - is still one of the best available. Some of his views on logic, for instance, that the grammatical subject of a sentence may not be what the sentence is really about, became standard through their acceptance by Bertrand Russell, an acceptance which survived Russell's repudiation of idealist logic and metaphysics around the turn of the century. Russell's and G.E. Moore's subsequent disparaging attacks on Bradley's views signalled the return to dominance in England of pluralist (that is, non-monist) doctrines in the tradition of Hume and J.S. Mill, and, perhaps even more significantly, the replacement in philosophy of Bradley's richly metaphorical literary style and of his confidence in the metaphysician's right to adjudicate on the ultimate truth with something more like plain speaking and a renewed deference to science and mathematics.

Bradley's contemporary reputation was that of the greatest English philosopher of his generation. This status did not long survive his death, and the relative dearth of serious discussion of his work until more general interest revived in the 1970s has meant that the incidental textbook references to some of his most characteristic and significant views, for example, on relations and on truth, are often based on hostile and misleading caricatures.

1 Life and works

Bradley was born in Clapham, England, on 30 January 1846. The literary critic A.C. Bradley was a younger brother. Educated at fee-paying schools and University College, Oxford (where he studied classical languages and literature, and ancient history and philosophy), he began the study of German, and is recorded to have read some at least of Kant's *Critique*, while still at school. In 1870 he was elected to a fellowship requiring no teaching and terminable only on marriage, at Merton College, Oxford. Six months later he suffered a severe inflammation of the kidneys: he had little public life thereafter, for cold, fatigue or stress was apt to make him ill. He occupied his fellowship until his death from blood poisoning on 18 September 1924. His major works are *Ethical Studies* (1876), *The Principles of Logic* (1883), *Appearance and Reality* (1893), *Essays on Truth and Reality* (1914) and the posthumously published *Collected Essays* (1935). He was awarded honours both foreign and domestic, including the Order of Merit. Though a freethinker, he was said to be politically conservative. His writings reveal a character far from narrowly intellectual.

2 Philosophy of history

Bradley's first publication was the pamphlet 'The Presuppositions of Critical History' (1874). Though perhaps the earliest major theoretical study in English of the notion of historical fact, it had little impact at the time, but the kind of position it takes has been subsequently influential, especially in religious studies. Bradley's acknowledged sources were German historians of the origins of Christianity, but his position resembles that of Hume on miracles in its scepticism concerning astonishing historical reports. The question raised by Bradley's argument - by what criterion should the credibility of historical testimony be judged? - stimulated the reflections of such philosophers as R.G. Collingwood. This essay provides a good introductory sample of Bradley's writing: characteristic in its highly-charged style, frequent obscurity and disdain of example, it also anticipates some of his later holistic themes, for example, the fallibility of any individual judgment and the rejection of correspondence notions of truth.

3 Ethics

Greater recognition came with *Ethical Studies*, a work which more than any of his others reveals Hegel's influence

in both its ideas and its dialectical construction. This construction means that Bradley's prefatory remark that the essays 'must be read in the order in which they stand' should be taken seriously. Although the third essay is a *locus classicus* of arguments against hedonistic utilitarianism (see Hedonism; Pleasure; Utilitarianism) and the fifth presents with some passion a social conception of the moral life, the common idea that these two can be read in isolation as representing Bradley's own final views is mistaken. What *Ethical Studies* aimed at was a gradual working-out of an account of morality which, unlike the prevalent utilitarianism, did full justice to ordinary moral ideas and did not rely on a deficient notion of the self. (One of the book's governing notions is that ordinary moral thinking is not to be displaced by the fruits of moral philosophy.) This development originates in an examination of the 'vulgar' notion of moral responsibility, and a rejection of both determinism and indeterminism as one-sided views obtained by concentrating on different aspects of human action which coexist unproblematically but are made to appear as conflicting by abstraction from the whole (see Free will §§1-2, 4). It continues in the second essay by asking 'Why should I be moral?' His answer is that the moral end for each of us is self-realization, but as he holds all action to be self-realization whether the action be wicked or otherwise, he has to explain the kind of self-realization which is morality's goal: it is to realize oneself as an infinite whole (see Self-realization). One thing this may mean is that the fully moral self is not to be limited by any other self: that is, one aim of morality is the resolution of conflict between one's good and bad selves in favour of the former. Another is that self-realization can be accomplished only through the mutual dependence of self and society. But what it amounts to is meant to be revealed through consideration of representative philosophical theories, each of which, through its one-sidedness, is more or less unsatisfactory as it stands. One is hedonistic utilitarianism, from which, roughly speaking, Bradley drops the hedonism and individualism but retains the utilitarianism (being prepared to regard happiness as the goal of morality (see Happiness) provided it is not thought of as some independently identifiable state which could just as well be attained by some more convenient means, that is, as externally related to morality itself). Next comes a Kantian ethics of duty, from which he retains the idea that the performance of *duties* is essential to morality, while dropping the notion that duty should be done for duty's sake rather than because of the particular content of the individual duty (see Duty; Kantian ethics). Both these theories come to grief because of erroneous views about the nature of the self, which, Bradley thinks, is a concrete universal and essentially social. In the fifth essay he develops a Hegelian account of morality according to which the self is fully realized by playing its role in the social organism. While Bradley recognizes this account to be inadequate, because, for example, communities themselves can have moral imperfections, it nevertheless differs in status from the views he considered previously, for he regards it as merely requiring supplementation (undertaken in the next essay on ideal morality). But he does not make clear how self-realization as a part of the social organism can be an intelligible moral demand, for Bradley's argument against social contract theories - that they presuppose an impossible metaphysics of persons, in that the parties to the contract are only contingently social - requires him to hold that the self is already and necessarily social. Yet perhaps this does not matter, for the book closes by condemning morality itself as ultimately a self-contradictory enterprise, depending for its existence on the existence of the evil it seeks to overcome, and thus rendering impossible the ultimate realization of the ideal self, a realization obtainable only in religion.

Some of Bradley's metaphysical apparatus is deployed in his moral philosophy, along with anticipations of his idealism and hostility to external relations. One example is the concrete universal, a notion which arises from his rejection of the standard universal-particular distinction, on the grounds that this distinction abstracts unreal elements (that is, those incapable of independent existence) from actual things. Thus when we attribute greenness to a leaf, both the particular (the leaf without its greenness) to which the greenness is attributed and the universal (the greenness without the leaf) are figments of the intellect; any impression of their independent existence arises from the mechanisms of thought. Thought has to divide reality up like this in order to function at all, but thereby distorts its nature. The concrete universal and the concrete particular are both the one individual thing: a leaf is universal in collecting together diverse abstract particulars, such as its various stages over time, and particular in its being distinct from other leaves. Communities and individual persons are likewise concrete universals, the former retaining their identities over many generations, the latter through many actions, and Bradley thought moral philosophy had to recognize this. Although the expression 'concrete universal' rarely figures in Bradley's work subsequent to *The Principles of Logic*, the idea involved is fundamental to his thought in both logic and metaphysics in its encapsulation of the idea that abstraction is falsification (see Hegel, G.W.F. §6; Universals).

4 Logic

The Principles of Logic looks strange to anyone whose conception of logic has been shaped by the formalism of Frege and Russell. Devoid of mathematically inspired methods, of axioms and rules of inference, it proves no theorems and employs no calculi. Often the text seems contaminated with discussion of psychological matters. Familiar terms, such as 'identity of indiscernibles', are used in ways unfamiliar enough to make one unsure whether they have much to do with what other people mean by them, and the terminology is often bewilderingly loose. Nevertheless, and despite its idealist vocabulary and florid metaphor, its title is apposite, for the book is devoted to issues fundamental to logic. It brought the notion of meaning, for instance, to the centre of the philosophical stage; and the absence of calculi is at least partly the result of a principled opposition to formal logic and the mathematicization of reasoning on the grounds that inference was thereby detached from the practice of science and the acquisition of knowledge. Some of its doctrines have been greatly influential, often via their impact onRussell, such as the suggestion that the logical form of universal sentences is hypothetical (a prototypical instance of the distinction between logical and grammatical form). It is a transitional work, expressing in the vocabulary of ideas and judgments views which were to usher in the era of meanings, sentences and propositions.

Much of the book is polemical, and, as in *Ethical Studies*, Bradley develops his own views gradually through criticism of others. It is divided into three, the first dealing with judgment and the remainder with inference. He begins by arguing that atomists such as Hume, who thought of judgments in terms of ideas, failed to distinguish the sense of 'idea' in which ideas are important to logic: they are not datable occurrences like mental images but abstract universals. He is thus often portrayed as rejecting psychologism in logic, but this is an exaggeration, for he thinks of logic's subject matter as mental acts, not as sentences, or propositions in the sense of Russell or of Moore. He then rejects some standard accounts of judgment. He complains that a subject-predicate account cannot do justice to relational judgments, and that thinking of judgment as the coupling of two ideas makes it impossible to see how judgment can be about anything real, since all the ingredients of judgments are universal and belong to the realm of idea, whereas reality is stubbornly particular and actual. As Bradley also argued that there could be no unique designation of individuals, even grammatical names and demonstratives being disguised general terms, he may have planted the seed of Russell's elimination of grammatically proper names by application of the Theory of Definite Descriptions (see Russell, B.A.W.).Bradley's own account of judgment is 'the act which refers an ideal content … to a reality beyond the act'. (By 'ideal content' he means a universal abstracted from a mental image; later he realized that this overestimates the role of mental imagery in judgment.)

When Bradley turns to inference, his targets remain the same. He complains that the mathematical logics of his time cannot represent valid relational inferences. He rejects Hume's account of inference in terms of the association of ideas on the grounds thatHume's ideas, as datable particulars, are fleeting entities which cannot be revived by association (see Hume, D. §2). Association is possible between ideas only if they are universals. (He calls this process 'redintegration'.) He rejects both syllogistic and Mill's methods of induction for failing to recognize that reasoning can proceed only on the basis of the generality implicit in the universals essential to inference (see Inductive inference). His own account of inference is that it is 'ideal experiment': ideal in that it belongs to thought, experiment in that its results are not guaranteed in advance by a complete set of logical laws which infallibly determine their own application.

Underlying much of Bradley's criticism of previous accounts of judgment and inference is hostility to psychological atomism, whose particulars he regarded not as concrete universals, realities in their own right, but as abstractions from the continuous whole which is psychological life. But likewise he regarded judgments themselves as infected with abstraction, since their subject matter is necessarily selected from a background and accordingly falsifies reality. Thus the objections which destroy misleading accounts of logic start to threaten logic itself, and, consistently, the book ends by suggesting that no inference is ever really valid and no judgment ever really true. Here it spills over into the metaphysics it had ostensibly tried to avoid.Bradley's view is that logic presupposes a 'copy' (correspondence) theory of truth, but it is clear that he thinks this theory metaphysically inadequate, a view he develops in *Essays on Truth and Reality*, where he argues for 'the identity of truth knowledge and reality'. Thus the claim thatBradley held a coherence theory of truth (endlessly repeated in textbooks) is mistaken. (Because he held reality to be a unified whole, he thought the *test* of truth to be 'system', which includes what is commonly meant by coherence (see Truth, coherence theory of §1).) This identity theory of truth, that for a thought to be true is for it to be identical with the logical subject of which it is predicated - reality itself - has led to his being unfairly accused of confusing predication with identity. His relation to the

correspondence theory exemplifies a constant difficulty in trying to understand Bradley: he adopts various theories and suggestions temporarily only to abandon them as ultimately unsatisfactory, so that it can be hard to work out his commitments.

5 Metaphysics

Bradley's metaphysics gets its fullest exposition in *Appearance and Reality*, though this needs to be considered in the light of subsequent essays. It is divided into two books. The first, 'Appearance', is brief and destructive. It argues that 'the ideas by which we try to understand the universe' all involve us ultimately in contradiction. Some of these are philosophical, such as the suggestion that only primary qualities are real, while others belong to common sense, such as motion, space, time, relation, thing and self. The second, 'Reality', concerns the Absolute, the ultimate, unconditioned reality, undistorted by human conceptualization (see Absolute, the).

Many of the arguments in Book I are not unique to Bradley and make only part of his case: for example, primary qualities are inconceivable without secondary, motion involves paradoxes. But the arguments of the chapter 'Relation and Quality', which in generalized form allege that relations are unintelligible either with or without their terms, and terms unintelligible with or without their relations, are of a different order. Bradley himself said that a grasp of these arguments would lead the reader to condemn 'the great mass of phenomena', and it is clear that his views on relations are central to his thought. Thus it is unfortunate that the arguments are so sketchily and unconvincingly presented that even sympathetic commentators have found it hard to defend him. In part this is because the arguments are often read as designed to prove the doctrine of the internality of all relations (that is, their reducibility to qualities or their holding necessarily, depending on the sense of 'internal'). This is a misreading, but it is understandable, for Bradley flirted with the doctrine of internality in *Appearance and Reality*, only repudiating it in later works less frequently read, like the unfinished essay 'Relations'. Also he rejected the reality of external relations, and it is natural to interpret this as adherence to the doctrine of internality. But his considered view was that neither external nor internal relations are real. One of his main arguments for this conclusion was that if relations were another kind of real thing along with their terms, then a further relation would be required to relate them to the terms (and so on, *ad infinitum*). It is clear from this and from his own explanation that to be real is to be a substantial individual, that the denial of the reality of relations is the denial that they are independent existents (see Substance). But some have thought he meant that all relational judgments are false, for instance, that it is false that Galileo preceded Newton. AndBradley's theory of truth gives credence to such suggestions, for by that theory no ordinary judgment is perfectly true, so that to someone who assumes that truth is two-valued, his claim looks to be that such judgments are all false. But Bradley thought truth admitted of degrees, and that, provided we confine ourselves to everyday purposes and do not try to meet the exacting demands of metaphysics, it is true that Galileo preceded Newton. The imperfection of this truth is nothing to do with the judgment's being relational as opposed to predicative. A perfect truth would be one which did not abstract from reality at all. Such a complete description would have to be identical with reality itself and thus would no longer be a *judgment*. On Bradley's view, then, the final truth about reality is literally and in principle inexpressible.

An outline, though, is possible. When Bradley comes to ask what reality is, his answer is that it is experience, in a wide sense of that term: 'Feeling, thought and volition (any groups under which we class psychological phenomena) are all the material of existence, and there is no other material, actual or even possible' ([1897] 1930: 127) (see Idealism). His insouciantly brief argument for this challenges the reader to think otherwise without self-contradiction; he is more concerned to make clear that reality is not the experience of his individual mind, and that his doctrine is not solipsistic.

Bradley's criterion of reality is the absence of contradiction, and as he argues that the distinctions necessarily employed in judgment introduce contradiction, it follows that thought cannot capture reality. Nor can anything involving relatedness. Thus reality must be a non-relational unity, one which contains diversity because room must be found for appearances themselves. How? For illustration, Bradley appeals to a pre-conceptual state of immediate experience in which there are differences but no separations and from which the cognitive consciousness arises by imposing distinctions upon the differences. Reality, he thinks, is like this, except in transcending rather than falling short of thought, including everything in one comprehensive and harmonious whole (see Monism). Wollheim suggests that the best analogy for the relation of appearances to the Absolute is that of a painting (another might be an ecosystem): particular segments of the canvas would be falsified, even

made ugly, by abstraction from the whole to which they contribute, yet that character which makes for ugliness in isolation may nevertheless be itself beautiful in its surroundings and essential to the beauty of the whole. Bradley rejects the demand for detailed explanations of how phenomena like error are reconcilable with the Absolute, trying to shift the burden of proof to those who profess confidence in their incompatibility. His general answer is that anything that exists, even evil, is somehow real and thus belongs to the Absolute, which comprehends and transcends both good and evil (as well as religion): it is neither, but is further from the latter than the former.

Few philosophers have found Bradley's positive metaphysics persuasive. But it stands as a permanent challenge to the capacity of discursive thought to represent the world as it is in itself, a challenge posed by turning the mechanisms of thought upon themselves and demanding that they meet their own standards.

STEWART CANDLISH

List of works

Bradley's works are best consulted in the latest of the editions mentioned. These are the ones usually cited in recent discussion; they are also the most useful in that, while the earlier text is usually left intact, Bradley's later thoughts are added in the form of notes, appendices and essays. The library of Merton College, Oxford, holds Bradley's unpublished papers, notebooks and letters received. The Russell Archives at McMaster University contain letters from Bradley to Russell (some interesting extracts appear in *The Collected Papers of Bertrand Russell*, vol. 6, 349-53), and the John Rylands Library of the University of Manchester has letters from Bradley toSamuel Alexander.

Bradley, F.H. (1876, 1927) *Ethical Studies*, Oxford: Clarendon Press.(The second edition, published posthumously, contains unfinished notes by Bradley; the text is otherwise that of the first.)

Bradley, F.H. (1883, 1922) *The Principles of Logic*, London: Oxford University Press.(The second, revised edition adds extensive commentary and terminal essays to the text of the first. Out of print at the time of writing.)

Bradley, F.H. (1893, 1897) *Appearance and Reality*, London: Swan Sonnenschein.(The second edition contains a substantial and important Appendix. The most commonly encountered version now is the so-called 'ninth impression' of 1930, on which all subsequent printings have been based. This was published in Oxford at the Clarendon Press after the rights were secured from George Allen & Unwin, which as George Allen had taken over Swan Sonnenschein. This ninth impression is a textually corrected version of the second edition, but has a completely different pagination. Out of print at the time of writing.)

Bradley, F.H. (1914) *Essays on Truth and Reality*, Oxford: Clarendon Press.(Mostly published in *Mind* from 1899 onwards, these are major essays containing developments of Bradley's logic and metaphysics, incisive criticism of William James and Bertrand Russell, and reflections on religion. Out of print at the time of writing.)

Bradley, F.H. (1930) *Aphorisms*, Oxford: privately printed at the Clarendon press; Bristol: Thoemmes Press, 1993, facsimile edn.(The modern edition is bound together with 'The Presuppositions of Critical History' and contains an introduction to the latter by Guy Stock.)

Bradley, F.H. (1935) *Collected Essays*, Oxford: Clarendon Press.(Contains the two pamphlets 'The Presuppositions of Critical History' (1874) and 'Mr Sidgwick's Hedonism' (1877) as well as the valuable unfinished essay 'Relations' and a good bibliography of Bradley's published works. Out of print at the time of writing.)

Bradley, F.H. (1994) *Writings on Logic and Metaphysics*, ed. and with intros by J.W. Allard and G. Stock, Oxford: Oxford University Press.(Contains well-chosen extracts from the *Logic*, *Appearance and Reality* and *Essays on Truth and Reality*. The helpful introductions are both general and topic-specific; this is a very useful edition for undergraduates.)

Bradwardine, Thomas (*c.*1300-49)

Thomas Bradwardine was a leading figure in fourteenth-century philosophy and theology from 1328, when he completed De proportionibus velocitatum in motibus (On the Ratios of Velocities in Motions), until his death in 1349, shortly after becoming Archbishop of Canterbury. His theory of ratios of velocities in motions was an important reinterpretation of Aristotle and was influential throughout Europe. The author of numerous mathematical and logical works, Bradwardine helped to initiate a style of natural philosophical analysis using a standard set of logical and mathematical tools. On the Continent, Nicole Oresme, Albert of Saxony and many others wrote works on the ratios of velocities in motions following Bradwardine's lead. In his De futura contingentibus (On Future Contingents) and De causa Dei Pelagium (On the Cause of God Against the Pelagians), Bradwardine staked positions emphasizing the symmetry of God's omniscience with respect to past, present and future.

1 Life and works

Born around 1300, Bradwardine is known for his association with Merton College, Oxford, and it was probably while he was at Merton that he composed the treatises *De insolubilibus (On Insolubles) De incipit et desinit (On 'It Begins' and 'It Ceases')*, *De proportionibus velocitatum in motibus (On the Ratios of Velocities in Motions)*, *De continuo (On the Continuum)*, *Arithmetica speculativa (Speculative Arithmetic)*, *Geometria speculativa (Speculative Geometry)* and possibly other logical works. In approximately 1332-3 Bradwardine, as a bachelor of theology, lectured on Peter Lombard's *Sentences*. Only fragments of these lectures remain, probably including what is known separately as *De futuribus contingentibus (On Future Contingents)*. In 1335 Bradwardine became a member of the group of scholars surrounding Richard de Bury, Bishop of Durham. He became a Master of Theology in the late 1330s, was named chancellor of Saint Paul's Cathedral in London in 1337, chaplain to Edward III in 1339 and Archbishop of Canterbury in June 1349. The *De causa Dei contra Pelagium et de virtute causarum ad suos Mertonenses (In Defence of God Against the Pelagians and On the Power of Causes)*, begun at Oxford, was completed in London probably in 1344 (see Augustinianism).

2 Theory of ratios in motions

Within the arts faculty at Oxford, Bradwardine's greatest impact undoubtedly came from his *De proportionibus velocitatum in motibus*. Aristotle, in the *Physics*, had supposed that the velocities of motions are related to their causes in such a way that when the force causing a motion is multiplied, the velocity will be similarly multiplied. Likewise, Aristotle had supposed that when resistance to motion is multiplied, the velocity is, inversely, reduced in a like ratio. Aristotle's discussion of the relationships of forces, resistances and velocities served his purposes in arguing that a vacuum is impossible. If there were a vacuum, Aristotle argued, then an elemental heavy body falling in the vacuum would have no resistance, and hence an infinite velocity would result. Since an infinite velocity is a self-contradiction, a vacuum is impossible.

In *De proportionibus*, Bradwardine first laid out the theory of ratios familiar from the theory of musical ratios as found in Boethius. He used this understanding of operations on ratios to reinterpret Aristotle's theory. Velocities vary, he said, as the ratio of force to resistance. When the ratio of force to resistance is 'doubled' the velocity is doubled, when the ratio is 'tripled' the velocity is tripled and so on, with the understanding that 'double' the ratio 3:1 is the ratio 9:1 (its square), and that 'triple' the ratio 2:1 is the ratio 8:1 (its cube). This new understanding of Aristotle's theory had the advantage of being expressed in similar words while avoiding a serious weakness of the theory itself, namely that it could not explain the mathematical relationships of forces and resistances in very slow motions. Everyone agreed that for motion to occur at all the force must be greater than the resistance. Suppose, then, that the ratio 2:1 produces a certain velocity. It follows on Aristotle's theory that the ratio of 1:1 should produce half that velocity, but in fact it produces no velocity at all, since the force is not greater than the resistance. Thus Aristotle's theory cannot account for any velocity smaller than half the velocity produced by the ratio 2:1. By contrast, Bradwardine's function provided values of the ratio of force to resistance greater than 1:1 for any velocity down to zero, since any root of a ratio greater than 1:1 is always a ratio greater than 1:1.

Bradwardine's proposed new function won immediate acceptance in universities all over Europe, beginning at Oxford where the so-called Oxford Calculators took it up. It also inspired people to quantify motions in every way

possible. Bradwardine's function was assumed to hold for rotations as well as rectilinear motions, and for alterations, augmentations and diminutions as well as local motions. In Paris, Nicole Oresme and Albert of Saxony wrote treatises on ratios, building on Bradwardine's rule. Oresme used the theory to argue that since most ratios are incommensurable with one another, when ratios of ratios are understood in the Bradwardinian sense, the velocities of motion of the planets caused by ratios of force to resistance will also likely be incommensurable, meaning that planets will never return to exact conjunctions in the same location in the sky. Astrological predictions based on such repetitions of positions will therefore be impossible.

Taking the ratio of force to resistance as the measure of motion 'as if with respect to cause' (*tanquam penes causam*), philosophers then asked about the measure 'as if with respect to effect' (*tanquam penes effectum*). For instance, should a rotation be measured by the average velocity of the points of the rotating body or by the distance traversed by the fastest moved point, as Bradwardine had argued in the last book of *De proportionibus*? Learning how to operate with ratios as Bradwardine did became a standard part of the arts curriculum in many later medieval universities, and subsequently became part of the theology curriculum as well.

3 Other works

In contrast to the novelty of Bradwardine's *De proportionibus*, his *De continuo* argued for what were at the time well-established conclusions. As Aristotle had argued, no continuum is composed of indivisibles. Moreover, indivisibles such as points, lines, planes and instants, despite their use by mathematicians, do not exist in the real world (a position also taken by Ockham, Buridan and other fourteenth-century nominalists). However, although most scholastics believed that the composition of continua from indivisibles was inconsistent with both Euclidian geometry and Aristotelian physics, in the period just before Bradwardine no less a scholar than Henry of Harclay, Chancellor of Oxford, had been persuaded by theoretical considerations of God's knowledge that the points in a line must be immediate to each other. Harclay's defence of immediate indivisibles derived from the view proposed by Robert Grosseteste that God measures a line by intuiting the infinitely many mediate points contained within it. In Harclay's opinion, Grosseteste's view implied his own: if God intuits all the points in a line, Harclay argued, they must be immediate to each other.

Perhaps the most original aspect of Bradwardine's *De continuo* was his strategy for combatting indivisibilists (or 'atomists') of every kind. Instead of arguing in turn against each of the theories that posited the composition of continua from indivisibles, Bradwardine began in an axiomatic format and then argued against key theses combined in different ways by the different theories. Thus he argued first against immediately conjoined indivisibles, a thesis common to the Pythagoreans (see Pythagoreanism), Harclay and Walter Chatton. Then he argued against the composition of a continuum from finitely many indivisibles, a thesis maintained by the Pythagoreans and Chatton but not by Grosseteste or Harclay, proving his point by running through every known discipline or science. Turning next to the theory that a continuum is composed of infinitely many indivisibles, a view common to Harclay and Grosseteste, Bradwardine used both natural philosophical and mathematical arguments. A key conclusion in the axiomatic part of *De continuo* was that if one continuum has (infinitely or finitely many) immediate atoms, any continuum has them. This enabled Bradwardine to argue that if a line has immediate atoms, so do bodies, motion and time, and vice versa.

Despite the supposed reciprocity between conclusions in the different disciplines, natural philosophical arguments were fundamental to Bradwardine's project. What would happen to indivisible surfaces if a single body of water were divided in two or if two bodies of water were joined together? Would the division create new surfaces and the joining destroy them and, if so, what would cause such creation or destruction of indivisibles? It was in light of such physical considerations that Bradwardine in Part VIII of *De continuo* finally denied the existence of indivisibles altogether. Thus despite the prominence of mathematics in his work, Bradwardine remained an Aristotelian, implicitly assuming that natural philosophy gives a truer description of reality than mathematics.

Bradwardine's other mathematical and logical works do not seem to have been particularly notable. In *De insolubilibus*, Bradwardine may have been the first to suppose that insoluble propositions - for example, the liar paradox - imply not only their own falsity but also their own truth. In *De incipit et desinit*, Bradwardine not only restated standard views concerning first and last instants of permanent and successive things, but also raised questions about the relations of successive continua such as motion and time to future contingency. If, for instance, no motion has a last instant of being, then if a body is in motion at an instant, it will necessarily be true that it must

continue in motion in the future, since the instant at which it is in motion cannot be the last instant. However, the continuation of its motion is, presumably, contingent. How then can the continuation of the motion after the present instant of motion be both necessary and contingent?

Bradwardine's *De futuris contingentibus* and *De causa Dei contra Pelagium* were directed against contemporaries who had argued that there are real future contingents despite God's omniscience and who had adopted a Pelagian position with regard to human action, admitting the possibility that human merit and willpower could lead to salvation without God's freely given grace (see Pelagianism). William of Ockham was the most prominent target of Bradwardine's arguments in *De futuris contingentibus*, and his major opponent in *De causa Dei contra Pelagium* was most likely Thomas Buckingham, who modified his own position as a result of Bradwardine's views.

Like *De continuo*, *De causa Dei contra Pelagium*, a work of 876 printed folio pages, has an unusual format, combining strings of conclusions with prolific quotations from authoritative authors. Admitting that earlier in his life the Pelagian position had seemed more reasonable to him, Bradwardine emphasized instead the necessity of grace. The revival of a Pelagian position among Bradwardine's contemporaries seems to have arisen in part from considerations of God's freedom. Could God choose to allow some individuals to lead meritorious lives without divine grace? To say no would seem to limit God's liberty.

In response to such a line of thought, Bradwardine reaffirmed God's power, goodness and immutability. God is the first and most immediate cause of everything that happens, including the choices humans make by their free wills. Being the cause of everything that happens, God causes evil as well as good, but this is only relative evil and contributes to the overall good (see Evil, problem of). Absolutely central to Bradwardine's argument was the assertion that God is eternal and therefore immutable: God is not in time, and any implication that he might 'change his mind' or be affected by human choices after they occur is mistaken (see God, concepts of).

In *De consolatione philosophiae*, written in the early sixth century, Boethius had attempted to address questions of God's foreknowledge and human free will by arguing that God's timeless knowledge of the future does not determine the future any more than human observation determines what is seen. Using the ideas of logical possibility introduced into the discussion of free will by Duns Scotus - who had argued that for an act to be freely chosen it is not necessary that the individual making the choice ever actually make a different choice, only that it not be logically contradictory to have made a different choice - Bradwardine argued that God's relations to past, present and future are identical. God freely chooses how he designs the cosmos, though he does so only once. It is not logically contradictory that God could make a different choice, but he will not in fact do so since he is not in time. In a way beyond human comprehension, human free will and divine determination are said to be not inconsistent, but rather compatible with each other (see Eternity; Free will; Omnipotence).

Brahman

The Sanskrit word brahman *(neuter) emerged in late Vedic literature and Upaniṣads (900-300* BC*) as the name (never pluralized) of the divine reality pervading the universe, knowledge or experience of which is a person's supreme good. The word's earliest usage (often pluralized) is to refer to the verses of the oldest work in Sanskrit (and in any Indo-European language), the Ṛg Veda (*c.*1200* BC*), which is a compilation of poems and hymns to Indo-European gods. The individual verses of the poems are mantras (*brahmāṇi*), whose proper enunciation in the course of ritual and sacrifice was thought to secure various aims. Thematically, the Ṛg Veda and other early Indian literature presents a sense of pervasive divinity. Apparently through an assimilation of the idea of the magic of mantras to the divine immanence theme the word* brahman *assumed its later meaning. In any case, Brahman - the Absolute, the supremely real - became the focus of Indian spirituality and the centre of much metaphysics for almost three thousand years, down to the present day. In the Upaniṣads, which are mystic treatises containing speculation about Brahman's nature and relation to ourselves and the world, the central positions of Vedānta schools emerge, all of which are philosophies of Brahman. But not even in the narrow set of the earliest and most universally accepted Upaniṣads (numbering twelve or thirteen) is there expressed a consistent worldview. Important themes about Brahman may be identified, but there is no overall unity of conception, despite what later exegetes claim. The unity of the early Upaniṣads concerns the premier importance of mystical knowledge or awareness of Brahman (*brahma-vidyā*), not precisely what it is that is to be mystically known. The classical Indian philosophical schools of Vedānta systematized the thought of early Upaniṣads.*

1 The Vedas and Vedic literature

The poems of the *Ṛg Veda*, most but not all of which address gods of an Indo-European pantheon, were transmitted until modern times through the care of a priestly caste. A Vedic (later, Hindu) priest is known as a *brāhmaṇa* or even a *brahmán* (masculine, as opposed to *bráhman*, neuter). The apparent etymological connection between the word for the Absolute and that for the caste has provoked no little consternation and speculation in a sociological vein among modern scholars. The solution to the mystery appears to lie in the shamanic role of the poet-cum-priest in early Indo-European society. According to Vedic scholars, the poems of the *Ṛg Veda* seem the results of competitions in eloquence among seers (*kavis*) or shamans over generations, each poem conceived as inspired by a shaman's sense of 'occult correspondences between the sacred and profane' (Renou 1953: 10). As Vedic society became more settled in its practices, rituals and sacrifices became fixed, with shamans assuming the offices of priests and keepers (that is, memorizers) of the sacred hymns. Original composition ceased, and the *Ṛg* and three other Vedas assumed their canonical forms. Individual verses of the poems, referred to in the Vedas themselves as *bráhman* (neuter), became central to ritual performances, and the importance of the overall content - stories of the gods, identifications of correspondences among spheres of life, and so on - waned. The verses, known as 'mantras', were considered invested with magical power.

Vedic themes were not forgotten, however. Throughout the *Ṛg Veda*, a sense of pervasive divinity is expressed. Gods correspond to, or inhere in, natural forces, and there is a divine structure and rhythm to the universe as a whole. Moreover, although the gods hymned are plural, each when addressed is said to be supreme. At places, a kind of monotheism is evident: 'They have styled Him Indra [the Chief of the gods], Mitra [the Friend], Varuṇa [the Venerable], Agni [Fire], also the celestial, great-winged Garutmā; for although one, poets speak of Him diversely; they say Agni, Yama [Death]), and Mātarīśvan [Lord of breath]' (*Ṛg Veda* 1.164.46). This verse has been interpreted as an early expression of Indian henotheism: one God, that is, Brahman, takes various divine forms, and is worshipped in various forms by people according to personal proclivities. Thematically, the Vedas express a multifarious divinity and unitive spirituality important to most subsequent Indian religion.

In later Vedic literature - prose appendages called *brāhmaṇa* and *āraṇyaka* - the supreme force moving the gods and operative throughout the universe is designated for the first time *brahman* (neuter). The term conveys a sense of mystery, and distinct proposals are made about just what Brahman is (for example, wind, breath, the sun). Brahman is said to be *svayam-bhū*, 'self-existent', and is identified with Prajāpati, 'Father of Creatures'. The *Śatapatha Brāhmaṇa* (*c.*900 BC) declares at 10.2.3: 'In the beginning this universe was just Brahman; Brahman created these gods.'

2 Upaniṣads

Early Upaniṣads (from 800 to 300 BC) represent a break with the ritualism of later Vedic literature, and speculation about Brahman becomes decidedly more pronounced. Debates on metaphysical topics called *brahmôdya*, 'discourses on Brahman', held in the courts of kings and princes, are recorded. (A *brahmôdya* was apparently only a riddle contest in the earlier period.) In particular, the reasonings of the 'Brahman-knower' Yājñavalkya against various opponents in the court of King Janaka, as reported in the Bṛhadāraṇyaka Upaniṣad (*c*.800 BC), may be taken to usher in a new era of Indian thought, marked by abstraction and self-conscious argument.

However, the early Upaniṣads present at best variations on central views. No single coherent worldview is expressed, but rather arguments and proposals centred on Brahman and Brahman's relation to ourselves and the universe. Despite what later exegetes claim, there is no unity of theory. Later proponents of Upaniṣadic philosophies (called Vedāntins) look for an overall unity because they view the Upaniṣads as revealed texts.

Many Upaniṣadic passages are exploratory, playfully spinning stories with rather abstruse morals, or etymologies, usually false, of words with psychological meanings. Brahman is usually approached psychologically; the early Upaniṣads are predominantly mystical texts. The self as known in meditation is the medium for knowing the Absolute, the self's mysterious ground, which turns out to be the ground of the entire universe. As though announcing a discovery, some Upaniṣads proclaim the identity of the self and Brahman. Several rich psychological conceptions are worked out and asserted with a tone of confidence that contrasts with the tentativeness of statements about Brahman.

Nevertheless, there are at least ten themes about Brahman that reverberate throughout both early Upaniṣads themselves and later Vedāntic philosophy: (1) Brahman is self (*ātman*) and consciousness; (2) Brahman is world ground; (3) Brahman is transcendent of 'names and forms' (*nāma-rūpa*), that is, transcendent of finite individuality; (4) Brahman is unitary, the coincidence of opposites, and omnipresent; (5) Brahman has 'nondual' (*advaita*) self-awareness; (6) Brahman is the essence or finest part of everything; (7) Brahman is the locus of value, with awareness of Brahman as the 'supreme personal good' (*parama-puruṣārtha*) and 'liberation' (*mukti*) from fear and evil; (8) Brahman is mystically discoverable; (9) Brahman is beyond the power of thought; (10) Brahman is the creator and inner controller of all things.

It would be difficult, if not strictly impossible, to read the Upaniṣads uninfluenced by the centuries of later commentary and interpretation. The great debate among classical Vedāntins concerns the question of the theism of early Upaniṣads, or, more broadly, how Brahman relates to the world. The theistic interpretation - of Brahman as God creating a world of real particulars - is eschewed by the Advaita (Non-Dualist) school. Theistic Vedāntins cite Upaniṣadic passages stating that Brahman determines individual names and forms, *nāma-rūpa*. In their view, Brahman is a primordial Will and Controller - that is, 'God', *īśvara*. The dispute is irresolvable in the Upaniṣads themselves. Theme (10) is as pronounced as any, textually speaking. But Advaitin exegetes find a way of subordinating it to other themes. Conversely, Vedāntic theists interpret Upaniṣadic monism as underscoring their understanding of creation as emanation. Brahman as God looses forth (or manifests, *sṛjate*) the world out of God's own substance, as a spider's web is spun out of its own body.

The Advaita interpretation emphasizes themes (4) and (5), the unity and self-awareness of Brahman. At Bṛhadāraṇyaka 4.1.7, Yājñavalkya says, 'With only an awareness of *ātman*, self, should one meditate, for here [in the self] all these things become one.' The prominence of monism here - a spiritual monism in accordance with the idea (theme (1)) that Brahman is self or consciousness - provides grounds for interpreting individuality ('names and forms') as *mere* names and forms, as Advaita would do. The logic of the reasoning is not complex: if there is just one thing, how can there be many?

Moreover, in other Upaniṣadic passages, Brahman is explained through an analogy with dreaming, an analogy that fuels an Advaita assimilation of the theistic doctrine of creation to the idea of the One. Bṛhadāraṇyaka 4.3.9-10: '[Sleeping,] one takes along the stuff of this all-embracing universe [and] tears it apart himself [and] shapes it himself.… He is the all-maker, for he is the maker of everything.' Advaitins understand the 'He' as Brahman identical with *ātman*, who enjoys various states of himself - specifically, waking, dreaming and a state transcending both where the soul is 'aware only of its own light' (see also the Māṇḍūkya Upaniṣad). In the dream state, emanationism seems valid, and waking, says the Upaniṣad, is like dreaming. But states involving awareness

of objects other than the self are expressly declared to be less valuable than self-illumination. Thus a subordination of theist emanationist cosmology to an illusionism about diversity seems to be called for, too: this is the Advaita reading.

Vedāntic theists, for their part, propose a stratified view of reality, of Brahman, ranging from an essential Divine to material things. Passages such as Taittirīya Upaniṣad 2.1-, with its theory of five sheaths progressively manifesting an essential soul, and Chāndogya Upaniṣad 6.8.7-, with its proclamations that Brahman is an indwelling essence (theme (6)) can be read as supporting the stratified reading: there is an essential Brahman, both transcendent and dwelling in the heart of everything, who progressively manifests in this world. Physical things may be furthest from what God is in God's own nature, but, as Taittirīya 3.1.2 says, 'matter [too] is Brahman'. Perhaps the most significant theistic passage comes from the Bṛhadāraṇyaka (3.7.1-23): 'He who, dwelling in the earth, is other than the earth, whom the earth does not know, whose body the earth is, who controls the earth from within - is the Self, the Inner Controller, the Immortal' (this last refrain - verse 3 - is then repeated with substitutions). Finally, the Sanskrit word for God, *īśvara* and cognates (such as *īś*), appear in early Upaniṣads dozens of times as apparent synonyms of *brahman*.

3 Advaita Vedānta

The classical Indian philosophical schools of Vedānta systematized the thought of early Upaniṣads. These schools divide broadly into the psychological monism of Advaita Vedānta and theistic views of Brahman championed by non-Advaitins. According to Advaita, the central Upaniṣadic teaching is that Brahman is the self. The world, and God, are illusions of false consciousness. According to Indian theism, in contrast, Brahman is God, the real creator of a real universe. Despite this opposition, concessions regarding Brahman can be discerned in each camp.

Developments in thought about Brahman continue long past the early Upaniṣads to such modern philosophers as Aurobindo Ghose and Sarvepalli Radhakrishnan. Most contributions occur under the banner of the Advaita Vedānta school or a confederation of Indian theists. There is also speculation about Brahman as Speech (*śabda-brahman*) in the writings of Bhartṛhari. Both Advaita and Indian theism are intellectually long and complex movements, and we shall confine ourselves exclusively to the the most significant developments in the thought about Brahman.

Advaitins devote special attention to Brahman's nature and how it is possible for us to conceive of that nature on the one hand, and to the relation, or nonrelation, of Brahman to the world on the other. In the first case, the concern is principally to shore up a sense of the value of liberation. In the second, it is to defend a view of Brahman as an absolute unity admitting no differentiation whatsoever.

Advaitin thought about Brahman's nature appears to be soteriologically motivated; that is to say, a view of experience or realization of oneself as Brahman, considered the supreme goal of life, dictates the direction of its elaborations. Classical Advaita also asserts that nothing positive can be predicated of Brahman (themes (3) and (9)), since positive characterization is confined to differentiating finite things. But inasmuch as this view stands in tension with elaborations of Brahman's nature, it is usually conveniently ignored or muted through speculation, not very successful, about the power of metaphor and indirect indication (*upalakṣaṇa*). The soteriological need is overriding.

A stock characterization of Brahman as *saccidānanda* emerges at the centre of this project: Brahman as existent or existence (*sat*), as awareness (*cit*) and as bliss (*ānanda*: the compound *saccidānanda* is formed by euphonic combination). Brahman is in fact said to be the sole existent, the single reality; the sole consciousness, a single self of everyone; and a supreme bliss. Who would not want to realize this?

There is controversy in particular concerning how Brahman is bliss. Some insist that this is said only to indicate that Brahman is not subject to the hedonic content of our normal experience; others that this underscores the supreme value of personal realization of Brahman. In either case, a soteriological context is key. The spirit of the elaboration is not to spell out how Brahman underpins our everyday experience, how Brahman as existent underlies the existence of everything, how Brahman as conscious sustains consciousness, and the like. Advaitins when confronted with such interpretation typically retreat to their stance about metaphor and indirect indication, though some do say that the bliss of Brahman is (distantly) reflected in our finest moments of worldly pleasure and happiness.

Exegetically, conflict with theistic Vedāntins seems to have inspired the notion of *nirguṇa brahman* contrasting with *saguṇa brahman*, Brahman as 'without' and 'with qualities', though the distinction also dovetails with the Advaita type of negative theology. Brahman-without-qualities is supremely real; Brahman-with-qualities is talked about in scripture as a concession to obtuse minds. Scripture is like a patient teacher (*guru*), and it is difficult to appreciate that Brahman as supremely real has no qualities. Scripture talks about God - Brahman-with-qualities - as a preparation for the austere truth.

Advaitins face obvious difficulties in upholding the view that Brahman is an absolute unity admitting no differentiation. Since Brahman is the only reality, diversity has to be illusory. But how can what is illusory even appear? And how did our spiritual ignorance - or awareness of diversity (and not of Brahman) - originate? How could it possibly originate, given that Brahman, as understood by Advaita, is the sole reality? Much reflection is devoted throughout the long history of Advaita to everyday perceptual illusion, since this is the analogy used for Brahman's relation, or nonrelation, to the world. One Advaita camp also maintains that the world of appearance has structure, that it can be studied and explained in its own terms, though not in relation to Brahman, which is a reality of an entirely different order. Another, dialectical, camp eschews such a two-tiered view, arguing that the reality of Brahman means that no sense can be made of the appearance of diversity, even in its own terms. This camp presents a barrage of arguments against all known pluralist ontologies, particularly that of Nyāya-Vaiśeṣika.

4 Post-Upaniṣadic Indian theism

The understanding of Brahman as God - the Creator and Sustainer of the universe as both its stuff and a will that fundamentally shapes things - is developed in devotional texts of popular religion, such as the *Bhagavad Gītā(Song of God*, *c.*200 BC), as well as in polemical treatises by theistic philosophers. The philosophers are much occupied with explaining precisely how the individual soul is distinct from Brahman, and the sense, if any, in which the two may be said to be identical. Rāmānuja (eleventh century) works an analogy between a substance as quality-bearer and the qualities it bears: God bears souls as accidental qualities, and is the necessary support of their appearance. Other theists use other metaphors; that of the ocean (God) and waves (souls) is common. The question is shaped by the controversy with Advaita and the Advaita insistence that the soul and Brahman are one.

Theistic philosophers also tend to stress God's love for the soul, teaching, in accord with the *Bhagavad Gītā*, that the best way to mystical knowledge of Brahman is not meditation or asceticism (associated with Advaita, Yoga and Buddhism), but rather a corresponding *bhakti*, or love of God. The whole world is God's play (*līlā*), say theistic Vedāntins; and through love of God, and worship and devotion, we are eventually to realize this and find in every experience the embrace of the Divine (see Madhva). Indian theists from the classical age into the modern conceive of a supreme personal good as a spiritual act of love-making.

The *Bhagavad Gītā* uses a Vedic motif, developed by later theists, to explain the process of emanation: sacrifice. Brahman sacrifices its infinity in becoming finite, and thereby creates the world. Several theists trace a process of contraction through gods and goddesses and earthly incarnations (*avatāra*) of God, through humans and animals and down to rocks and dust. Through sacrifice, Brahman emanates the world as its body. The *Bhagavad Gītā* teaches that through a reverse sacrifice of offering of the finite, a soul finds Brahman transcendent, the supreme good.

Brahmo Samaj

The Brahmo (or Brahma) Samaj (‘Society of Brahma’) is the name of a theistic society founded by Raja Rammohun Roy in Calcutta in 1828. It advocated reform, and eventually abolition, of the traditional caste system, as well as legislation aimed at improving the social status of women and greater protection of children. Also dedicated to Hindu religious reform, the Brahmo Samaj stressed a monotheistic doctrine with a policy of tolerance and respect for all major religions of the world. The society split into two factions in 1866, largely over the issue of the speed of reform. Another split occurred in 1878 over whether the society’s constitution was to be fully democratic. The democratic wing, called the Sadhāraṇ Brahmo Samaj (‘Universal Brahma Society’), is still active in India.

1 Rammohun Roy

The early history of the Brahmo (or Brahma) Samaj is closely tied to the life of its founder, Rammohun Roy. Born in the village of Radhanagar in the Hoogly district of Bengal on May 22, 1772 into an orthodox Brahmanical family, Rammohun Roy (Rāmamohan Raya) worked for the East India Company from 1803 to 1814. He received in his boyhood the traditional education of the country and soon attained remarkable proficiency in Arabic, Persian and Sanskrit. Later in life he learned Greek, Latin and Hebrew. The study of Islamic theology shook his faith in the popular polytheistic and idolatrous forms of Hindu worship, and made him a lifelong admirer of the uncompromising monotheism of Islam. His subsequent acquaintance with the Upaniṣads, the *Brahmasūtra* and the *Bhagavad Gītā* convinced him that the concept of the unity of the Godhead constitutes the essence of Hinduism. He also came to have profound respect for the moral precepts of Jesus Christ.

Like many of his contemporaries, Rammohun Roy saw Indian society in the nineteenth century as caught in a vicious web created by religious superstition and social obscurantism. Hinduism, as Max Weber observed in his celebrated sociological study of Indian religion (1916), had become a compound of magic, animism and superstition. One of the features of society that Roy found most distressing was the socially inferior position of women. The birth of a girl was usually unwelcome; her marriage became a financial burden for her parents, who customarily had to pay the husband’s family a dowry; and, if her husband died before her, her widowhood was seen as inauspicious. Because of these attitudes, attempts to kill girl infants at birth were not unusual. At the other end of life, it was also not unusual for widows to burn themselves alive on the funeral pyres of their deceased husbands, a practice known as *satī*, which literally means ‘good woman’. Roy described this as ‘murder according to every religious text’.

Another debilitating factor in Hindu society was the system of hereditary caste, which sought to maintain hierarchical social segregation on the basis of ritual status. Rammohun Roy came to be convinced that the rules and regulations of caste hampered social mobility, fostered social divisions and sapped individual initiative. Above all other injustices of the caste system was the humiliation of untouchability, which militated against human dignity. There were innumerable other practices in the Hindu society of his day that Roy saw as marked by arbitrary constraints, credulity, uncritical acceptance of authority, bigotry and blind fatalism. Rejecting them as features of a decadent society, Roy’s Brahmo Samaj (‘Society of Brahma’), established in Calcutta in 1828, sought to create a social climate for modernization.

Rammohun Roy was fully alive to the challenge that had come to India in the form of Western civilization and felt strongly the need for a new philosophy which would, without sacrificing the genuine spiritual heritage of India, absorb and assimilate the modernism imported from the West. He warmly advocated the introduction of Western science and technology in the educational curriculum and became a pioneer of English education and socially progressive journalism in India.

Rammohun Roy and his Brahmo Samaj advocated the emancipation of women. They opposed polygamy, indentured servitude and the custom of *satī*. It was due to Roy’s efforts that William Bentinck, then Governor General of India, passed the famous regulation number XVII declaring *satī* a criminal offence. The Brahmo Samaj also opposed child marriage and the rigidity of the caste system, and it supported the remarriage of widows, equal rights for men and women, and the right of daughters to inherit property.

The creed of the Brahmo Samaj was declared to be universal monotheism. Its worship could be joined by anyone irrespective of their religious affiliations. Hence, according to Brahmo Samaj doctrine, there is no divine incarnation and no priestly mediation. Nature, earth and heaven were all said to have been created by a single God. Since there was no need for the mediation of priests, there was to be no hereditary priestly class and no performance of sacrifices. The Brahmo Samaj laid an emphasis on universal love for all human beings, irrespective of race or creed. Despite the universalistic features of the Brahmo Samaj, Roy gave a decidedly Hindu character to the form of worship within it. Worship at this early stage consisted of readings from the Vedas and the Upaniṣads, a sermon and devotional music.

2 Debendranath Tagore and Keshub Chunder Sen

Next to give organizational machinery to the Brahmo Samaj was Debendranath Tagore (Devendranatha Thakura, 1817-1905). He established the Tattvabodhini Sabha in 1839 with the objective of propagating Brahmo *dharma*. Until 1866 he remained the accredited leader of the Calcutta Brahmo Samaj and carried forward the best tradition of the days of Rammohun Roy. A doctrinal change that occurred in Brahmoism during this time was the abandonment of the belief in the infallibility of Hindu scriptures. Tagore laid more pronounced emphasis on *bhakti*, or devotion, in his exposition of religious texts. Under his inspiring leadership the Brahmo Samaj played a distinguished role in sponsoring social reforms such as the remarriage of widows, spreading education and vigorously opposing the efforts of Christian missionaries to gain converts from the ranks of Hindus.

The next phase of the Brahmo movement is dominated by Keshub Chunder Sen (Keśavacandra Sena, 1838-84), who joined the Samaj in 1857 and became Tagore's right-hand man. Having imbibed more of Western culture and Christian influence, Sen advocated a much more aggressive programme than Tagore, the latter favouring a slow and cautious approach to social reform. The two radically different temperaments led to a parting of the ways and paved the way for the first schism in the society. In 1866 Sen established the Brahmo Samaj of India (Akhila-Bhārata Brahma-samāja, 'Pan-Indian Brahma Society'), after withdrawing along with his supporters from the parent body, which henceforth came to be known as Ādi Brahmo Samaj ('The Original Brahmo Samaj').

Sen's Brahmo Samaj of India adopted a much more radical and comprehensive scheme of social reform than before, including programmes for female education and emancipation, and the complete abolition of caste distinction. Its activities led to the formation of the Indian Reform Association in 1870 and the enactment of the Native Marriage Act of 1872, which fixed the marriageable age of girls and boys at 14 and 18 respectively.

Probably owing to Christian influence, the doctrine of the Brahmo Samaj of India placed much more emphasis on the sense of sin, the spirit of repentance and the efficacy of prayer. The scriptures of Hinduism, Islam, Christianity and Buddhism were studied with great respect. An infusion of devotional fervour into Brahmoism made it a practical religious culture. Sen had a sympathetic and respectful attitude towards all religions and proclaimed a comprehensive synthesis of religions under the title of the Nava Vidhāna ('New Dispensation') in 1880. The New Dispensation called for faith in a living God, and explained that the several religions of the world are but varying interpretations of this one God. Though diverse and fragmentary, the religions of the world were seen as mutually complementary rather than exclusive.

The second schism of the Brahmo Samaj occurred in 1878, when a band of Sen's followers demanded the introduction of a democratic constitution for the Samaj, which was not conceded. To make matters more complicated, Sen's daughter had been married in violation of the provisions of the Native Marriage Act of 1872. The dissenters formed the Sadhāraṇ Brahmo Samaj ('Universal Brahma Society'), which took shape under the leadership of Anand Mohan Bose (Ānandamohan Basu) and framed a democratic constitution based on a universal adult franchise. It declared in 1882 that it was about to establish a worldwide republic. This new body has proved up until now the most powerful and active branch of the Brahmo Samaj of India.

Brazil, philosophy in

It is possible to distinguish between European philosophy in Brazil and Brazilian philosophy. The former refers to Brazilians who participate in discussions of issues occurring in the European philosophic tradition without any reference to Brazilian reality and its problems; the latter to those Brazilian intellectuals who respond to the problems growing out of situations which have confronted the nation historically whether their philosophical orientations have originated in Europe or elsewhere. This entry focuses on the latter and generally follows a historical progression. This progression spans from the precabralian Tupi-Guarani speaking societies of eastern South America to the healthy development of Brazilian philosophy since 1950 after the founding of the Institute of Brazilian Philosophy.

1 Precabralian Tupi-Guarani worldview

Pedro Álvarez Cabral was a Portuguese navigator who accidentally discovered the Brazilian coast in 1500. A nascent precabralian civilization extended along eastern South America which still exists in so far as a common set of assumptions, attitudes and values is operative among extant Tupi-Guarani speaking societies. When the Portuguese arrived they found a lingua franca uniting these people. A comparative study of myths of creation and destruction of the earth reveals a creative spirit, in the very act of creativity, emerging out of fundamental chaos in which irrational forces of annihilation struggle against any emergent deity with the capability to dispel darkness and nihility - 'he-who-creates-his-own-body-out-of-primeval-darkness' (Gillette Sturm 1991) - sustaining himself in the process, while simultaneously creating the heavens and the earth through creative wisdom. The creative process is intentionally dialectic, a dynamic struggle between opposites, involving feminine-masculine collaboration. The view of temporality is neither cyclical nor linear, but helical. Creation of language, love and sacred song lays the foundation for humanity, but the temporal process is marked by a tendency toward deterioration: tiring, aging, dying. An annual ceremony at planting time is performed to drive away malevolent forces which threaten the germination of seeds and growth of plants with death and destruction. From the earliest records there are reports of groups who have followed leaders who have predicted catastrophes and the end of the world, marching towards the Atlantic and serving as models for other messianic movements in the Brazilian interior.

2 Philosophy in sixteenth-century Portugal

The sixteenth century witnessed the most exciting period in Portuguese intellectual history marking a golden age of Portuguese philosophy. It was the time of the voyages of discovery when the tiny nation of Portugal established commercial outposts on the shores and islands of four continents and briefly became a world power in trade and commerce. Portuguese philosophers and intellectuals reflected the latest developments in European thought and also contributed actively to the formation of the mind of modern Europe.

Early in the century the Dutch humanist Desiderius Erasmus attracted a group of Portuguese disciples. In 1547 the king founded the Royal College of Humanities at the University of Coimbra and entrusted it to humanists, although within eight years its control was transferred to the Jesuits (see Collegium Conimbricense). None the less, northern European and Italian humanism made their impact on sixteenth-century Portugal, even in formulations of scholastic resurgence later in the century at Coimbra. Among leading Portuguese humanists during the sixteenth century were João de Barros, Damião de Gois, Francisco de Holanda, André de Resende and Francisco de Sá de Miranda.

The famous School of Sagres in southern Portugal, which provided training in navigational skills and the use of new navigational instruments, cannot be considered a research centre for experimental science. However, the publications of several Portuguese involved in navigation, or who had the opportunity for travel to foreign lands, point to a decided change in orientation concerning the study of natural science, as well as to the beginnings of experimental methodology in the effort to understand natural phenomena. Among the experientialists were Duarte Pacheco Pereira and Garcia de Orta. The experimentalists include Pedro Nunes and José de Castro. Worthy of mention also is the sceptic and forerunner of Cartesian methodology Francisco Sanches.

The instruments of the Counter-Reformation, including Inquisition and Index, became operative during the

sixteenth century and the Society of Jesus was given responsibility for the direction of Portuguese educational curricula in 1555. However, the resurgence of Scholasticism, which had one of its points of origin at the University of Coimbra, was not a retrenchment to earlier orthodoxy, but an advance in the great tradition. Those who moulded the Second Scholasticism at Coimbra hailed from both Portugal and Spain. These were Pedro da Fonseca, the ‘Portuguese Aristotle’, Luis de Molina and Francisco Suárez. They produced a new philosophy curriculum referred to as *Cursus Conimbricensis*.

3 Colonial Brazil: philosophical problems

Portugal never established a university in Brazil. Students were expected to matriculate at the Universities of Coimbra or Évora. Several monastic orders founded colleges and seminaries where prospective university students could pursue an undergraduate curriculum based on the approved model at Coimbra.

The presence of indigenous people posed several unique problems. Questions were posed regarding whether these people were human, what kind of humans they were and what rights they had to land and liberty. In 1548 when Portugal sent the first governor-general to consolidate its territories in Brazil the crown made clear that priority was to be given to Christian missions among the indigenous. Eleven years earlier a papal bull had declared the Indians to be fully human and proscribed deprivations of their freedom or possessions. In the light of royal regulation and the papal bull the question of the humanity of the Indians and their rights under natural law should not have been raised. Yet by 1557 Manuel da Nóbrega, director of Jesuit missions, published his *Dialogue concerning the Conversion of the Gentiles*, in which the central question was ’Do these have a soul like us?’ It also dealt with issues of slavery, land sovereignty, nomadism, cannibalism, differences in ‘nations’ of Indians, social institutions and ethics. Both sides of the debate are represented equally with standard arguments taken from scripture and classic Greek and Roman philosophy. In the end the equality of all persons is declared. The nature/nurture distinction is emphasized: Indians do not differ essentially from other humans; the differences lie in the social milieu. Other Jesuits who concerned themselves with new issues were José de Anchieta and Antônio Vieira.

4 Adaptations of African ideas and values

In their defence of the Brazilian Indians the Jesuits recommended the use of African slaves. This led to the introduction of cultural traditions differing from both the indigenous and the European. Traditional societies in subSaharan Africa are characterized by a strong sense of integrated community extended to elements in the nonhuman environment. The soil upon which the society was established by the ancestors becomes a focal point uniting the generations as both burial-place and source of fertility which sustains the living and guarantees continuity of community. The slave trade forced Africans into permanent exile from their homeland and alienated them from their communities. This threatened human survival through a rootlessness which made existence impossible unless a process of transplantation to new soil and re-establishment of community occurred which again made possible contact with one’s ancestral homeland and historical social heritage. The achievement of this end included large-scale slave revolts and the founding of *quilombos*, autonomous communities of runaway slaves in the interior, coronation ceremonies for African chieftains in which historic traditions were incorporated with reaffirmation of allegiance to a sovereign representing the continuity of community; the invocation of nature and ancestral spirits in possession ceremonies.

After 1950 a body of literature emerged giving intellectual articulation to the worldview implicit in the practices of the African-Brazilian community. An important issue is the extent to which the African past remains essential to the community. José Ribeiro de Souza speaks for the ‘re-Africanization’ movement and works through the Institute for Afro-Brazilian Studies for the preservation in Brazil of west African languages. Alfred Costa Moura calls for total de-Africanization. W.W. da Matta-Silva takes a middle position in which African roots constitute an essential base for a universal intellectual and religious position.

5 Enlightenment thought in eighteenth-century Brazil

Academies, arcadias and literary societies based on Graeco-Roman models and encouraging revival of classical Arcadian literary style appeared in southern Europe during the Renaissance. Early in the eighteenth century they were transformed from centres of debate on literary questions articulated in the baroque style of Gongorism into

conduits for reception, diffusion and discussion of Enlightenment ideas. They were private associations selecting their own members and determining their own objectives and procedures. In 1724 the Brazilian Academy of the ‘forgotten ones’ was founded to produce an interdisciplinary history of Brazil based on observation and primary documentation. The Scientific Academy of Rio de Janeiro discussed questions of physics, chemistry, botany, medicine, surgery and agriculture, in addition to maintaining a botanical garden and carrying on active correspondence with the Swedish Royal Academy of Sciences. Many similar societies appeared throughout Brazil which gradually added sociopolitical topics to the agenda.

Agitation for educational reform began in Portugal early in the century, leading to the decision to change the Coimbra curriculum drastically, giving responsibility for Portuguese education to the Order of the Oratory instead of the Society of Jesus. Philosophy was no longer handmaid to theology; physics was liberated from Aristotelian philosophy; natural science was divided into autonomous scientific disciplines stressing laboratory research. Students returning to Brazil from studies in Europe brought these new ideas and procedures with them, leading to radical changes in secondary and collegiate education.

Brazilian authors addressing Enlightenment issues included Matias Aires Ramos da Silva (1700-63), whose book *Problems of Civil Architecture* (*c*.1740) was an exposition of the latest developments in the natural sciences of physics and chemistry; Tomaz Antônio Gonzaga (1744-1810), whose *Treatise on Natural Law* (*c*.1790) was a critical exposition of new directions in natural law theory; Nino Marques Pereira (1652-1735), whose novel depicting a journey from Salvador to São Paulo ridicules the professors of the Second Scholasticism; José Joaquim de Cunha de Azeredo Coutinho (1742-1821), economic theorist who argued for physiocrat principles and was founder of a model college focusing on scientific studies and experimentation emphasizing practical application to the Brazilian situation and Francisco Luís Leal (1740-1820), author of the first history of philosophy in Portuguese which distinguished between the ‘ancients’ and the ‘illustrious moderns’.

6 Philosophical ambiance at Independence

The first articulate stirrings towards independence from Portugal began with the Minas conspiracy of 1789, the 1798 revolt of the tailors in Bahia and the Pernambuco Insurrection of 1817. Ideological roots are found in the literary and scientific academies, the curricular reform at Coimbra and the lodges of freemasonry. Five intellectuals, alive at the time of the declaration of independence by Pedro I, are representative of the philosophical spectrum.

José da Silva Lisboa, Viscount of Cairu (1756-1835) was a political conservative, out of sympathy with the French Revolution, who favoured retaining the United Kingdom of Portugal and Brazil, which had been instituted in 1815. He was a disciple of Adam Smith and advocated the lifting of all restrictions imposed by policies of feudalism and mercantilism in favour of the *laissez-faire* principle of British economic liberalism.

José Bonifacio de Andrada e Silva (1763-1835), known as the Patriarch of Independence, returned to Brazil in 1819 as a member of the leading scientific academies of the European continent after spending thirty-six years there as a geologist and metallurgist. The first grand master of the Grand Orient of Brazilian Freemasons, he believed in the rational structure of the universe and the guarantee of rights of all humans by natural law. However, his insistence that Brazil was not yet ready for complete social transformation did not endear him to the republicans.

Silvestre Pinheiro Ferreira (1769-1846) supported the United Kingdom of Portugal and Brazil, which had been established in 1815 and the moderative power of the monarch. Fundamentally a Lockean, he was disturbed none the less by the failure of the empiricists to provide a complete system to support scientific and political theory and attempted to derive such a system through a reinterpretation of Aristotelian categories (see Aristotle §7;Locke, J.).

Frei Joaquim do Amor Divino e Caneca (1774-1825) was a Mason imbued with the spirit of French encyclopedism (see Diderot, D. §1.). He spoke for the nascent social revolutionary movement and was concerned especially with guaranteeing rights for the lower classes of Brazilian society.

Diogo Antônio Feijó (1784-1843) was a priest-philosopher and politician. He was also the leader of a small group of Kantians in São Paulo who broke with the stale ideas of French encyclopedism and the sensualism of Condillac, aware that Kant provided a radically new direction in philosophy (see Condillac, E.B. De; Kant, I.).

7 Philosophy during the Empire: eclecticism and positivism

Diverse motives had impelled the leaders of movements for independence. Some favoured a new economic order, but with a continuation of political ties with Portugal. Others urged political independence without changing the monarchical form of government. Voices were heard favouring republicanism. Some called for transformation of the socioeconomic order. This diversity of viewpoints, combined with Brazil's geographical immensity and a partial slave economy, caused some to predict that Brazil would become fragmented into several autonomous states. Leadership concerned with maintaining unity called for conciliation in the face of the divisiveness existing during the first decades of the empire.

Francisco José de Carvalho Mont'Alverne (1784-1858) is credited with directing Brazilian thought during the Regency and the period of 'conciliation' along the lines of Victor Cousin's eclectic spiritualism (see Cousin, V.). As H.-A. Taine put it, eclecticism proposed a peace treaty to all systems, just as representative government provided a forum to satisfy all elements of society. Its popularity in Brazil introduced intellectuals to the European philosophic scene in a panoramic, if vague, view. The political realm was also well served, because eclecticism provided an ideological basis for moderates. Eclecticism appealed especially to medical scientists concerned with issues of physiological psychology, such as Eduardo Ferreira Franca (1809-57), professor of medical chemistry in Bahia and José Maria de Morais Valle (1824-86), professor of medicine in Rio de Janeiro. In that vein are the works of Domingos José Gonçalves de Magalhães (1811-82), *Facts of the Human Spirit* (1858) and *Soul and Brain* (1876).

By the mid-nineteenth century Brazilian students of mathematics, physics and medicine were encountering Auguste Comte in France and Comtean positivism began to replace eclecticism in scientific circles. A series of doctoral dissertations began to appear in the 1850s written from a Comtean perspective. In 1876 Benjamin Constant (1833-91), professor of mathematics at the Military School and Luís Pereira Barreto (1840-1923), author of *As Três Filosofias* (1874) founded the Brazilian Positivist Association. The association was committed to realizing Comtean sociopolitical values. Two years later when Miguel Lemos (1854-1917) and Raimundo Teixeira Mendes (1855-1927) returned from France, the positivist Apostolate of Brazil was established. Comtean positivism had profound influence on the Brazilian intelligentsia, but was fragmented into scientific, political and religious factions (see Positivist thought in Latin America §5).

8 Reactions to positivism: School of Recife, spiritualism and modernism

The first reaction against Comtean positivism took the form of a polemic between Comteans in Rio and adherents of Spencerian evolutionary naturalism in Recife (see Spencer, H.). Silvio Romero (1851-1914), historian of Brazilian philosophy and literature, recounted the polemic in *Doctrine Against Doctrine: Evolutionism and Positivism in the Republic* (1894). Along with Clovis Bevilaqua (1859-1944), Fausto Cardoso (1864-1906), Tito Lívio de Castro (1864-90) and Artur Orlando (1858-1916), he is identified with the School of Recife, centred in the Law School of Recife and headed by Tobias Barreto de Meneses (1849-89). Tobias Barreto had abandoned eclecticism because of its vagueness and Comtean positivism because of its rejection of metaphysics. Spencerianism was followed by an enthusiastic espousal of 'Germanism' and the development of a naturalistic monism inspired by Noiré.

Two of Tobias's students broke with him as they moved in different directions, but both strongly influenced the birth of Brazilian modernism. José Pereira da Graça Aranha (1868-1931) articulated a unique metaphysical position of monism based on aesthetics and mysticism. Raimundo de Farias Brito (1862-1917), impelled by a sense of bankruptcy in European culture, spent much time critically examining the development of modern philosophic and scientific thought, and formulating a 'philosophy of spirit' (see Anti-positivist thought in Latin America).

9 Brazilian philosophy since 1950

Philosophic activity has been especially productive since the 1950s. Much credit goes to the founding in 1950 of the Institute of Brazilian Philosophy, a truly inclusive national association, and the *Revista Brasileira de Filosofia (Review of Brazilian Philosophy)*, which began publication in 1951, founded by Miguel Reale. Through national and regional congresses and an active programme of adult education the Institute of Brazilian Philosophy has

fostered much philosophical dialogue. Reale has been a controversial figure and a firm believer in intellectual and political pluralism. He is known especially for his tridimensional theory of law and his philosophical position of ’ontognosiology’. He is also one of the founders of the Interamerican Society of Philosophy and the International Association for Philosophy of Law and Social Philosophy.

A concern for study of Brazilian philosophy is seen in the work of João Cruz Costa (1962) and Antônio Paim (1967; 1983) and several series of publications of the classic texts of the tradition. Official interest in the utility of philosophy in determining national policy was evident in President Juscelino Kubitshek’s establishment of the Advanced Institute of Brazilian Studies (ISEB) as part of his administration. Under the direction of the philosopher Roland Cavalcanti de Albuquerque Corbisier, one of the divisions was concerned with philosophical issues and involved collaboration with Álvaro Vieira Pinto and Hélio Jaguaribe.

Brazilian philosophers who have established an international reputation in their fields include Leônidas Hegenberg and Newton Carneiro Alfonso da Costa who have been associated with the Centre for Logic, Epistemology and History of Science at the Federal University of Campinas, Romano Galeffi, founder of the Brazilian Centre for Studies in Aesthetics, Henrique C. de Lima Vaz, Leonardo and Clovis Boff, Hugo Assman, Dom Helder Câmara, Rubem Alves, theologians of liberation (see Liberation theology), Paulo Freire, educational theorist, Leôncio Basbaum, Caio Prado Junior, J. Chasin, Marxists, Stanislavs Ladusãns, Catholic philosopher and Gerd Bornheim, phenomenologist.

Antônio Paim (1983) has pointed to a group of Brazilian philosophers whose concerns are similar enough to constitute a movement with roots in Brazil’s intellectual past and a commitment to a pluralistic, dialogic approach to philosophical issues with a concern for cultural context. Paim calls this the Culturalist School and mentions as prime movers, *inter alia*, Miguel Reale, Djacir Menezes and Luís Washington Vita.

Brentano, Franz Clemens (1838-1917)

Brentano was a philosopher and psychologist who taught at the Universities of Würzburg and Vienna. He made significant contributions to almost every branch of philosophy, notably psychology and philosophy of mind, ontology, ethics and the philosophy of language. He also published several books on the history of philosophy, especially Aristotle, and contended that philosophy proceeds in cycles of advance and decline. He is best known for reintroducing the scholastic concept of intentionality into philosophy and proclaiming it as the characteristic mark of the mental. His teachings, especially those on what he called descriptive psychology, influenced the phenomenological movement in the twentieth century, but because of his concern for precise statement and his sensitivity to the dangers of the undisciplined use of philosophical language, his work also bears affinities to analytic philosophy. His anti-speculative conception of philosophy as a rigorous discipline was furthered by his many brilliant students. Late in life Brentano's philosophy radically changed: he advocated a sparse ontology of physical and mental things (reism), coupled with a linguistic fictionalism stating that all language purportedly referring to non-things can be replaced by language referring only to things.

1 Life and intellectual development

Franz Brentano came from a talented family. He mastered ancient and scholastic philosophy as well as the works of Comte and the British empiricists. He always prized Aristotle above other philosophers, and regarded German Idealism as the nadir of philosophy. Brentano's vision of philosophy as an exact discipline sharing its true method with natural science inspired his many famous students, who included such noted philosophers as Anton Marty,Carl Stumpf, Alexius Meinong, Christian von Ehrenfels, Edmund Husserl, and Kazimierz Twardowski, as well as later political leaders German Chancellor Georg Hertling and the first President of Czechoslovakia, Thomas G. Masaryk.

Brentano's life was one of controversy and disappointment. In 1864 he became a Roman Catholic priest and played an important role in the discussion of the proposed doctrine of papal infallibility. In a position paper commissioned by the Bishops of Germany he recommended that they reject the doctrine. When the doctrine was officially proclaimed, Brentano felt justified in giving in to other doubts that had been tormenting him, concluding, for example, that the doctrine of the Trinity was contradictory. In 1873 he resigned from the priesthood, the church, and his position in Würzburg. His career as a Professor in Vienna was short-lived. A legal controversy surrounding the question whether ex-priests could marry led him to resign his Professorship in 1880, a position to which, in a *cause célèbre*, he was never reinstated, remaining an instructor (*Privatdozent*) until he left Austria for Italy in 1895. In later years he became blind and was estranged from several of his older students. Brentano did not relish publication: apart from the uncompleted *Psychology* he published mainly short papers, lectures, and monographs on the history of philosophy. His views underwent continuous revision, but a major change occurred during the first decade of the twentieth century, when his ontological views went through a 'Copernican revolution' whose results even his closest followers found difficulty in accepting. Large quantities of letters, lecture notes and dictated pieces remained unpublished at his death. Many of these were edited from Prague between the wars, with support fromMasaryk.

2 Psychology

Brentano's interest in psychology dated from his early occupation with the work of Aristotle and the British empiricists. *Psychologie vom empirischen Standpunkt* (*Psychology from an Empirical Standpoint*) (1874) helped establish psychology as an independent discipline. Following Comte in deliberately eschewing metaphysical controversy,Brentano, though believing in the soul, determined psychology as the science not of the soul but of mental *phenomena*. He writes: 'All the data of our consciousness are divided into two great classes: the class of physical and the class of mental phenomena.' Brentano initially restricted scientific investigation to phenomena or appearances and regarded the assumption that there are things in themselves as very uncertain. Physical phenomena are those sense-objects (for example, colours, sounds, odours) that we experience whenever we have a sensation or an imagined or dreamed counterpart of a sensation.

Comte had held inner observation to be impossible, since it would require us to split ourselves mentally in two. Brentano countered that inner perception is possible, because every mental act is accompanied by a secondary

awareness of itself. Inner perception and memory form the solid experiential basis of psychology. Brentano was concerned in the *Psychology* to establish a proper taxonomy of mental acts. Following Descartes, he divides them into three classes: ideas (*Vorstellungen*), judgments and a third class comprising emotions, feelings, desires and acts of will, variously called interests or phenomena of love and hate. Ideas merely present something, judgments accept as existent or reject as nonexistent something presented, while interests take a pro- or con-attitude to something judged. Thus interests presuppose judgments and these in their turn presuppose ideas. So all mental phenomena are either ideas or are founded on ideas. Brentano's classification has not been widely accepted.

From the late 1880sBrentano divided psychology into descriptive psychology, which he also sometimes called 'phenomenology' (see Phenomenological movement), and genetic psychology. The former is an a priori, philosophical discipline concerned with the basic elements of consciousness and their modes of structural combination, resting on the certain evidence of inner perception. The latter is a posteriori, empirical and probabilistic, concerned with the causal laws governing how mental phenomena arise and perish and the connections between the mental and the physiological.

3 Intentionality

In the search for a positive criterion marking off mental from physical phenomenaBrentano revived the Aristotelian-Thomistic conception of intentional inexistence in the *Psychology*. Every mental phenomenon is intentional, contains an object in itself, or no physical phenomenon does. In seeing something is seen, in judging something is accepted or rejected, in hoping something is hoped for and so on. Hence psychology cannot be reduced to or replaced by a physical science. Brentano maintained this demarcation principle but modified his conception of intentionality in a more epistemologically realist direction. A middle phase finds him rejecting the immanent conception of objects, accepting that the object of intentionality may be outside consciousness, and may be real, or an *ens rationis*, like a state of affairs, or even nonexistent. This middle view was most influential among his students.

Brentano's student Twardowski went on to distinguish the mental acts themselves from their subjects, from their objects and their contents. Your seeing Jones would be, according to Twardowski's account, a mental act that has you as its subject, Jones as its object and a visual image as its content. Every mental act then has an object, but not all such objects exist or are real. This view influenced Meinong's theory of objects (see Meinong, A. §§2-4; Twardowski, K. §3).

However, Brentano himself later rejected all non-real and nonexistent objects (see §4 below). Since someone who judges (correctly) that unicorns do not exist seems to stand in a rejecting relation to something nonexistent, Brentano came to regard intentionality as not a relation but as merely relation-like, the similarity being that we think of relations in a similar way. In thinking of John touching Mary, we think directly of John and indirectly of Mary, but she too exists. In thinking of Mary rejecting unicorns we think directly of the unicorn-rejecting subject Mary and only indirectly of what she rejects. There are no non-real objects; they are fictions engendered by a careless use of language.

Brentano emphasizes that, in knowing that one is in a mental state, one knows directly and immediately that there is a certain individual thing - namely, the one who is in that state. And *you*, of course, are the one who is in your mental state. We may single out three different phases of this situation: (1) I can know that I hope for rain; (2) as a rational being, I can conceive what it is to hope for rain; and (3) that the only type of entity that can have the property of hoping for rain is an individual thing or substance.

Following Leibniz, Brentano distinguishes two types of certainty: the certainty we can have with respect to the existence of our conscious states, and the a priori certainty that may be directed upon axioms and other necessary truths. These two types may be combined in a significant way. At a given moment, I may be certain, on the basis of inner perception, that there is believing, desiring, hoping and fearing; and I may also be certain a priori that there cannot be believing, desiring, hoping and fearing unless there is a substance that believes, desires, hopes and fears. In such a case, it will be certain for me (Brentano says that I 'perceive') that there is a substance that believes, desires, hopes and fears. It is also axiomatic,Brentano says, that if one is certain that a given substance exists, then one is identical with that substance.

4 Types of being: substance, accident and boundary

InBrentano's earlier writings he assumed that in addition to concrete individual things or *entia realia*, there are also 'non-things' or *entia irrealia,* falling into several different categories. They include: (1) 'intentionally inexistent' objects, such as that devil that is supposed to 'exist in mind' when one thinks about a devil; (2) those objects, often called 'propositions', thought to be designated by 'that'-clauses or sentential gerundives (as in 'that there are living beings on Venus', or 'there being living things on Venus'); (3) properties or universals, such as redness and being-both-round-and-square; and (4) states and events.

Brentano's rejection of such 'non-things' was based upon two general principles. First, the only objects that we can think about, strictly speaking, are concrete individual things. We do think of concrete things; 'think of' is univocal; therefore whatever we think of is a concrete thing. 'Concrete' does not here imply materiality. God and the soul, according to Brentano, are concrete but non-material. Second, an adequate understanding of language will show us that any plausible statement that ostensibly refers to such non-things may be construed as pertaining only to concrete things. Brentano defends the second principle with considerable ingenuity.

The theory of 'concrete predication' tells us that all of our thoughts may be adequately expressed by using concrete terms in place of predicates. We may best understand this theory if we imagine that all predicates in our language have been replaced by terms, and consider a view of the world which might naturally suggest itself to us if our language were in fact of such a sort, as it very well could have been. 'Concrete predication' may recall whatAristotle had said of simple judgments: 'An "affirmation" is a statement affirming something of something; a "negation" is a statement denying something of something'. In simple affirmative judgments, Aristotle said, we combine things; and in simple negative judgments we separate them. Since such statements as 'Mary is thinking' are for us a natural way of describing people, one might suppose that, when a person is thinking, they stand in a certain relation to the property of thinking. But if we say 'Some persons are *thinkers*' (Brentano uses '*ein Denkendes*', which one might translate more literally as 'a thinking-thing') then it may be more natural to suppose that we are describing not a relation between an individual thing and a property, but a relation between those individual things that are persons and those individual things that are thinkers. What, then, is the relevant relation between persons and thinkers?

Brentano uses Aristotle's term and says that the thinker is an 'accident' of its subject.Aristotle had said, however, that accidents are 'in' their subjects.Brentano saw that there was a reason for reversing this, claiming that accidents *contain* their subjects. The relation of substance to accident is similar in fundamental respects to that of part to whole. Brentano tells us what may seem surprising at first, that a substance is a part of its accidents. An accidental determination of a substance is a larger whole which is not necessary to its substance. If I happen to be thinking at the moment, I am a substance which, for now, is a thinker. The thinker is, at the moment, an accident of that substance which is identical with me. An accident is something containing its substance but not necessary to the substance.

A substance is *necessary to* its accidents. The accidents could not exist unless the subject exists - just as, according to the principle of 'mereological essentialism', every whole is ontologically dependent upon its parts. But no accident is necessary to its subject; hence the use of the word 'accident'. The expression 'X is an accident of Y' does not then introduce any unfamiliar concept into ontology, but refers only to a more generalized version of the part-whole concept.

In addition to distinguishing those individuals that are accidents from those that are substances, Brentano points out that there are individuals of still another sort. These include the points, lines and surfaces that constitute the inner and outer 'boundaries' of spatial objects. Boundaries exhibit a unique type of ontological dependence. Every boundary is necessarily such that it is a boundary of some constituent of the thing of which it *is* a boundary; but this is not to say that, for any thing of which it is a boundary, the boundary is necessarily such that it is a constituent of it. The point is of fundamental importance to ontology and the theory of categories, and may be put more precisely. Every boundary *x* is necessarily such that it is a boundary of (and therefore a constituent of) some constituent *y* of the entity *z* of which it happens to be a boundary. But from this fact, it does not follow that there is a constituent *w* of *z* which is such that *x* is necessarily a constituent of *w*. For example, a spatial point P is necessarily such that it is a constituent of a constituent C of the line L of which P happens to be a constituent. But, for any constituent C of L that you might mention, P need not be a constituent of C; some smaller constituent of C

would do just as well. Analogously, this holds for the relation of lines to surfaces and for the relation of surfaces to three-dimensional bodies.

By contemplating the concept of a boundary in this way, Brentano claimed, we acquire the concept of infinite divisibility by means of which we can then understand what it is for an entity to be ‘continuous’. The general problem of the continuum occupied Brentano throughout his philosophical career.

5 Truth

Like Aristotle, Brentano holds that the primary sense of ‘true’ is its application to beliefs or judgments; a secondary sense is its application to sentences. This theory of truth is properly called a ‘doxastic theory’. Brentano originally upheld a version of the correspondence theory of truth, but since his mature ontology has no place for such entities as facts or propositions, his final theory is not a correspondence theory as it is usually understood (see Truth, correspondence theory of §§1-2).

By reflecting upon judgments that are certain, according to Brentano, we obtain the concept of the ‘correctness’ of judgment. Once we have this concept, we are able to extend it beyond the sphere of the certain and thereby derive the broader concept of truth. We may speak, then, of a strict sense and of an extended sense of ‘correct’. In its strict sense, ‘correct’ will mean the same as ‘certain’. (Actually, Brentano uses ‘evident’ in place of ‘certain’; but he uses it in the way in which most epistemologists now use ‘certain’.) If, however, we use ‘correct’ in its extended sense, then we may also say that a judgment is correct if it agrees with a judgment that is certain - that is, if it accepts what a judge who has certainty would accept or rejects what such a judge would reject. In *Wahrheit und Evidenz (The True and the Evident)*, Brentano defines truth thus:

> Truth pertains to the judgment of one who judges correctly - one who judges about a thing in the way in which a person who judged with evidence would judge about it; it pertains to the judgment of one who asserts what the person who judges with evidence would assert.
>
> (1930, 139; 1966, 122)

The concept of correctness also plays an essential role in Brentano’s moral philosophy and general theory of value.

6 Ethics and the theory of value

Brentano’s moral philosophy is based upon his theory of value. His theory of value, in turn, is a theory of ‘intrinsic value’, about what is good in itself, or good as an end, about what is bad in itself, or bad as an end, and more generally about the relation of intrinsic preferability.Brentano’s theory of intrinsic value is based upon the analogy he believes to hold between intellectual and emotive phenomena. One may take an intellectual stand towards an object of thought, thereby having a positive belief or a negative belief about that object; one may ‘affirm’ the object or ‘deny’ it. One may also take an emotive stand with respect to the object, in which case one ‘loves’ the object or one ‘hates’ it. Brentano uses ‘love’ and ‘hate’ somewhat broadly to cover what we might call, respectively, ‘pro-feelings’ and ‘anti-feelings’.

What does it mean to say that a thing is intrinsically good or intrinsically bad? Brentano appeals again to the concept of correctness which is central to his theory of knowledge and truth. To say that a thing is intrinsically good, according to Brentano, is to say that it is ‘correct to love’ that thing as an end; and to say that a thing is intrinsically bad is to say that it is ‘correct to hate’ it as an end. Brentano believed that we can be immediately aware of the correctness of certain of our emotive attitudes, just as we can be immediately aware of the correctness (that is, the truth) of certain of our intellectual attitudes. In each case, the correctness consists in a relation of appropriateness or fittingness between the attitude and its object.

Brentano constructs a hierarchy of values in which pleasure plays a subordinate role. The principal bearers of intrinsic value, he claims, are conscious states. Some but not all conscious states are intrinsically good. And every conscious state *as* a conscious state contains some part that is intrinsically good. Every correct judgment is intrinsically good; so too is every correct emotion and every enrichment of our intellectual life. Since every intrinsic evil is itself a conscious state, there can be no intrinsic evil that does not include some intrinsic good. Among the things that are ‘predominantly bad’ are error, pain, every unjustified act of hate (especially the hatred of that which is good), and every unjustified act of love (especially of that which is bad). Sensory pleasure is, as

such, intrinsically good.

A complete account ofBrentano’s value theory would take into consideration a detailed analysis of aesthetic value, and also Brentano’s views on instrumental or practical value, which are broadly utilitarian.

7 Philosophical theology

Brentano’s philosophical theology depends upon a combination of the traditional arguments from motion and from contingency (see God, arguments for the existence of §1). He attempts to show that there can be no uncaused events and that the hypothesis according to which there is just one necessary substance, upon which all contingent things depend, has a probability approaching certainty. He combines this proof with an appeal to the evidence for design that we find when we contemplate ourselves and other living beings. Any sound epistemology, Brentano believes, will concede that there is such evidence. He then argues that the necessary substance is personal in that it is an intelligent being having both intellectual and emotive consciousness. It is also an immaterial being and is not a subject of accidents.

What distinguishes Brentano’s conception of God from that of most theologians is the thesis that God, like everything else, is a temporal being. Brentano describes an instance of God’s temporal consciousness this way:

> He now knows, for example, that I am writing down these thoughts. Yesterday, however, he did not know this, but rather that I will write them down later. And similarly he will know tomorrow that I have written them down.

(1976: 105; 1988: 87)

8 Historiography of philosophy

Brentano published five monographs on Aristotle, and several of his works on the history of philosophy have been published posthumously. His most characteristic view is that philosophy goes through cycles of advance and decline in four phases: a constructive theoretical phase, then in successively greater decline a practical phase, a sceptical phase and finally a mystical phase. The cycle then repeats itself. Brentano discerned three such cycles from the pre-Socratics to the German idealists, one each in ancient, medieval and modern philosophy. He clearly saw himself as ushering in a fourth constructive phase, a view to which one may give assent. Despite its obvious simplifications, the model is better than most others in accommodating philosophy’s uncertain progress.

Bridgman, Percy William (1882-1961)

Bridgman founded high-pressure experimental physics and was committed to a classical empiricist view of science - a view challenged by twentieth-century developments in relativistic and quantum mechanics. He argued that developments in special relativity showed the experimental operations scientists performed were suitable substitutes for basic constituents of matter, thus founding operationalism, a methodological position which influenced logical positivism and, transformed beyond his recognition, was expropriated by the behaviourist school in the social sciences. As Bridgman grappled with the challenges of general relativity and quantum mechanics, he increasingly parted company with his positivistic and behaviourist followers by moving more towards subjectivist views of science and knowledge. These later views led him to see and explore intimate connections between foundations of scientific knowledge and human freedom.

Bridgman developed a leak-proof seal for pressure-pistons which enabled him to obtain far higher pressures than his predecessors. He discovered allotropic forms such as ‘hot ice’ - solid water at $80°$ - and abrupt phase transitions wherein materials went from solid to liquid without an intermediary plastic stage. Existing theory neither predicted nor explained such phenomena, and so experimental work proceeded in a theoretical vacuum. This reinforced Bridgman’s classical empiricist belief that observation of, and experimentation on, reality was the basis of all science, not theorizing.

Bridgman construed Einstein’s 1905 special relativity theory (see Einstein, A. §2; Relativity theory, philosophical significance of; Spacetime), as showing that Newtonian space and time had no objective standing, thereby abolishing the absolute dichotomy between matter and motion and calling into question the ontological status of the quantities experimental science measured. He wrestled with the relativistic challenge in the 1914-26 ‘dimensional analysis’ disputes over the ontological status of measured quantities in physics, coming to the following conclusions: the quantities of physics are the products measurement produces according to a particular set of operations. Primary qualities are merely those regarded as fundamental. The dimensions of a primary quantity have no absolute significance, being merely reflections of the rules of operation in measurement. Since equations express equality of measured numbers, they too have no absolute physical significance.

Bridgman’s operational philosophy, introduced in 1927, essentially generalizes his dimensional analysis position and is strongly conditioned by his highly successful experimental discoveries done in an area where existing theory provided little guidance. His philosophical concern was making sense of experimentation and its place in an increasingly theoretical physics if absolute qualities did not exist. He concluded that special relativity also undercut such absolute principles as the uniformity of nature. The focal issue became how to make sense of truth without lapsing into irrationalism if an absolute or transcendental reality is rejected.

Bridgman interpreted Einstein’s special relativity theory as showing that objectivity is to be found in what the physicist *does*. What is real *is* what is meaningful and ‘we mean by any concept nothing more than a set of operations; the concept is synonymous with the corresponding set of operations’. Each operation thus defines a separate concept. For Bridgman the measuring operations were the *only* permanent physical entities. Bridgman saw operationalism as a method for analysis - for sorting out what was and was not real among scientific assertions - and not a criterion for regimenting or demarcating the scientific from the unscientific as others interpreted it (see Operationalism).

Bridgman later moved from the idea that meanings of scientific claims were the operations the scientist performed to the view that knowledge is the product of human activity and rests on acts of the understanding - an essential private knowledge component that is not to be compromised by externally imposed demands for consistency. Critics accused Bridgman of flirting with solipsism, a charge he steadfastly denied.

Bridgman interpreted general relativity theory as reintroducing absolutes to science. Since he had come to reject all absolutes, Bridgman rejected general relativity theory. His attempts to reconcile quantum theory and thermodynamics focused on what they showed about the limits of human subjectivity, reinforcing his rejection of all absolutes as unknowable. Metaphysical and other absolutes including absolute ethical principles thus were illegitimate vehicles for imposing conformity of intellect on others.

In subjectivity of knowledge Bridgman found the source of cognitive freedom: to be scientific is to rely on the intellect, accepting only what is operationally knowable, and thus is the paradigm of intellectual integrity. Intellectual integrity is the essence of freedom. In social, moral and political realms, the path to freedom is to be scientific. What was real socially and what was morally binding were what was true. To assess truth one relied on operational analysis. In *The Intelligent Individual and Society* (1938) he subjected social and moral concepts to operational analysis, arguing that 'duty', 'responsibility', the idea of a 'right', and 'justice' all fail to have operational meaning and thus have only coercive utility. So, too, the state fails to exist as an entity in its own right. Bridgman rejected the idea that 'the best and deepest interests of the individual are coincident with those of society'. Rather than embracing solipsism he found that the key to individual freedom from authority is one's isolation and subjectivity. Freedom is the only ultimate.

Brinkley, Richard (*fl.* 1350-73)

Richard Brinkley was a Franciscan theologian at the University of Oxford in the latter half of the fourteenth century. Probably at the request of his superiors, he undertook an attack on nominalism and conceptualism, resulting in his best-known work, Summa logicae (Synopsis of Logic). Other works include a commentary on Peter Lombard's Sentences, which survives only fragmentarily and in a student's shortened version. Brinkley had a significant influence on several generations of Oxford logicians and Parisian theologians.

Brinkley was active at Oxford University sometime between 1350 and 1373. His successors called him *Doctor Bonus* or *Doctor Valens* (the 'Good Doctor' or 'Capable Doctor'). His principal surviving philosophical work is the lengthy *Summa logicae (Synopsis of Logic)* comprising over one hundred manuscript folia (roughly equivalent to 500 ordinary printed pages). Brinkley's extant theological works include fragments of his *Commentum super Sententias*, a commentary on the *Sentences* of Peter Lombard, which also survives in a shortened version (*abbreviatio*) by Stephen Gaudet, who delivered his own commentary on the *Sentences* in 1361-2 (see Kaluza 1989: 181-88). The same manuscript in which Gaudet's *abbreviatio* is found also contains *Quaestiones magnae* and *Quaestiones breves (Long Questions and Short Questions)* on various philosophical issues in theological contexts, probably also by Brinkley. Lost works by Brinkley include a *Distinctiones scholasticae (Scholastic Distinctions)* listed by John Bale in the sixteenth century, and a *Quaestiones theologicales Biligam et Brinkel (Theological Questions of Brinkley and [Richard] Billingham)* (probably a student's compilation), mentioned in an old Prague University library catalogue. The *Lectura super Sententias (Lecture on the Sentences)* mentioned by Bale is very likely identical with the *Commentum*. Bale also mentions a *Determinationes (Determinations)*, but this work is probably by William of Foville, a Franciscan of Cambridge University.

Brinkley's *Summa logicae* seems to date from between 1360 and 1373 (see Gál and Wood 1980: 77-8), perhaps after his theological works. It was unusual but not unheard of for a medieval thinker to produce purely philosophical works after entering the faculty of theology. In Brinkley's case, this unusual sequence might have resulted from his having been ordered by his superiors to write a logical work against the predominant nominalism and conceptualism of his time. The *Summa logicae* advertises itself as a manual for young students, but primarily it is a polemical defence of the realist position regarding universals. It consists of seven parts: 'On Terms', 'On Universals', 'On the Categories', 'On the Supposition of Terms', 'On Propositions', 'On Insolubles' and 'On Obligations'.

Brinkley advances his position with sophisticated theories, some of which are of contemporary interest. For instance, in Part V of the *Summa logicae*, continuing a debate between Adam Wodeham and Walter Chatton, Brinkley argues against Richard Billingham (Regent Master at Oxford in 1349), William of Bermingham (a Doctor of Theology by 1362) and Richard Feribrigge (Rector of Shelton in 1361), who hold, respectively, that what a proposition signifies is a mode of a thing, a mental act or simply the significate of the subject term. Brinkley rejects the need for any intensional semantic entity, and holds the extentionalist position that the primary significate of any proposition is the coordinated things in the world signified by the terms of the proposition. Brinkley's views may have been known to Henry Hopton, Albert of Saxony and John Wyclif.

Brinkley's theory of supposition is thoroughly informed by his realist views. For instance, for Brinkley simple supposition occurs whenever a term designates an independent, extra-mental universal, as does the term 'man' in the proposition 'Man is a species'. Even compared to other realists, Brinkley adopted some unusual positions, such as his rejection of the usual interpretation of material supposition, associated with a term's standing for itself (as does the term 'man' in the proposition 'Man is monosyllabic'). All supposition, Brinkley says, requires a relation, and nothing can be related to itself.

Brinkley's theological writings are dated between 1350 and 1360. Like most ostensibly theological works of his day, his writings are an amalgam of physics, moral philosophy, epistemology and metaphysics, as well as pure theological speculation. It is difficult to assess the full range of Brinkley's thought definitively, given the fragmentary state of his literary remains. Much of what we know of him depends on allusions to his writings in the works of other authors. While Brinkley never achieved the status of an authority, he prompted both assent and dissent among several generations of Parisian theologians. In the fourteenth century alone, authors whom he

influenced include Angelus of Dobelin, Dionysius of Montina, Galerand of Pendref, Henry Totting of Oyta, Jacob of Eltville, John Bramarth, John Hiltalingen of Basel (and his associate Paul de Fonte), Peter of Candia, Stephen Gaudet and William Centueri of Cremona.

Brito, Radulphus (*c*.1270-*c*.1320)

Radulphus Brito was a prominent master of arts at the University of Paris around 1300. In order to secure the foundation of concepts in extramental reality, he devised a system of four types of 'intentions', first and second, abstract and concrete. As a philosopher of language, similar concerns made him claim a formal identity between the modes of signifying (of words) and the modes of being signified (of things).

Probably a native of Brittany, Radulphus Brito (Ralph the Breton) must have been born about 1270, as he became a master of arts in Paris no later than 1296 and doctor of theology, also in Paris, about 1311-2. He died in 1320 or later.

The extant body of Radulphus' work is mainly unedited. Most of it relates to his activity as a master of arts, and comprises questions on the Aristotelian Organon, including Porphyry's *Isagōgē*, the anonymous *Six Principles* and Boethius' *De differentiis topicis (On Topical Differences)*, and on Aristotle's *De anima*, *Physics*, *Meteorology* and *Metaphysics*, as well as on some mathematical and astronomical textbooks. There are also *sophismata* (investigations of particular logical problems), and a work on grammatical theory, *Quaestiones super Priscianum Minorem (Questions on Priscian Minor)*, also called *Modi significandi (Modes of Signifying)*. From Radulphus' career in theology we have questions on Peter Lombard's *Sentences*, a *Quodlibet* and *Quaestiones in Vesperis (Evening Questions)*.

Radulphus became quickly famous, and younger contemporaries such as Bartholomew of Bruges attempted to dispute his views. The logical works continued to be read until some time in the fifteenth century, especially in Italy, and in the 1430s some parts were translated into Greek by Georgios (Gennadios) Scholarios (see Byzantine philosophy).

Radulphus' fame rests on his epistemology, and in particular on his distinction between concrete and abstract first and second intentions, the conceptual counterparts of such series of nouns as 'man, humanity; universal, universality'. Traditionally, first intentions such as 'horse' were distinguished from second intentions such as *species*, which presuppose the first ones. Radulphus divided both first and second intentions into abstract and concrete ones. The abstract first intention is a formal concept, such as 'humanity'. It is based on the features or manifestations (modes of being, *apparentia*) of some essence (or 'nature'). Reasoning, for example, is a manifestation of human nature. This abstract first intention is a thought (*cognitio*) whose object is man, but it does not include its object. The concrete first intention is the object of the abstract one, but it is not purely extramental. It is the thing (for example, man) considered simply as thought of by means of the formal concept (humanity). Alternatively, it is described as an aggregate of the thing and the thought by which we grasp it. This ontological duplicity was often criticised in later times, but what Brito wanted was to secure the lifeline between concepts and their objects without moving the objects into the mind.

Likewise for the second intentions, the modes of being form the basis of concept formation, but this time the modes in question are not proper to some nature but common to natures. The abstract second intention, (for example, universality), is a concept derived from the common feature of being capable of occurring in several individuals or types. This feature is shared by, for example, 'man' and 'donkey', both of which can occur in several individuals, and also by 'animal', which can occur in several species. Our intellect need perform no comparison to construct a Porphyrian tree; sensory acquaintance with a single individual suffices to recognize, for instance, that sensing (which characterizes animals) is a trait apt to be shared by more beings than reason (which is reserved for humans). The corresponding concrete second intention (universal) is the thing (man) considered simply as conceived of by means of the formal concept of universality.

Earlier thinkers had held that second intentions arise from inspection and comparison of things already grasped by the mind. Brito wanted to generate them through direct inspection of the entities that gave rise to the first intentions. His aim was clearly to strengthen the link of the second intentions to reality by making them thoughts of things rather than of thoughts.

The linguistic theory (modism) prevalent in Radulphus' days took grammatical categories to be features (modes of signifying) of significative words but derived from features (modes of being) of things (see Language, medieval

theories of). Some decades of discussion had revealed weaknesses of the theory, and Brito fought an uphill battle to save it. Thus, to avoid difficulties arising from the existence of equivocal words, modes of signifying had been split into active modes, residing in words, and passive ones (modes of being signified), residing in things, such that one active mode could correspond to several passive ones. Seeing that this compromised the basic modistic idea of deriving features of thought and of language from features of reality, Radulphus claimed that the active modes are formally, but not materially, identical with passive modes, which in turn are materially identical with passive modes of being and of understanding. This view was taken over by the influential grammarian Thomas of Erfurt.

Broad, Charlie Dunbar (1887-1971)

A Cambridge contemporary of Russell, Moore and Wittgenstein, C.D. Broad wrote on an exceptional range of topics, including causation, perception, the philosophy of space and time, probability and induction, mind and body, ethics and the history of philosophy. He typically set out a number of received positions on a topic, explored their consequences with great clarity, and then came to a cautious estimate of where the truth probably lay. However, Broad made some notable contributions of his own, especially on perception (he defended a representative theory), induction (he argued that our inductive practices require the existence of natural kinds), and time (he argued that tensed facts cannot be analysed away). Although his talents lay in very careful analysis, Broad insisted that there was a proper place in philosophy for metaphysical speculation; he particularly admired McTaggart, and his monumental Examination of McTaggart's Philosophy (1933, 1938) contains some of Broad's best work.

1 Conception of philosophy

Broad was born near London and educated at Dulwich College and Trinity College, Cambridge, initially as a natural scientist. He then switched to philosophy, winning a prize fellowship at Trinity in 1911: his revised dissertation was published as *Perception, Physics and Reality* (1914). After teaching at St Andrews, Broad became professor of philosophy at Bristol University in 1920, then succeeded McTaggart as Fellow in Moral Science at Trinity College in 1923. Broad's return to Cambridge coincided with the publication of *Scientific Thought* (1923). *The Mind and Its Place in Nature* (1925) and *Five Types of Ethical Theory* (1930) quickly followed, and the first volume of his *Examination of McTaggart's Philosophy* appeared in 1933. The same year, Broad became Knightbridge Professor of Moral Philosophy in Cambridge. For most of the tenure of the professorship he was, at least by his own account, an 'unbelieving Pope' who 'no longer believed in the importance of philosophy' - though he continued to publish a steady flow of articles, and after retiring in 1953 he wrote a vigorous 'Reply to My Critics'. He also wrote extensively on psychical research, in which he had a lifelong interest.

Broad's later disaffection lay, more precisely, with the style of philosophy practised in a Cambridge that was increasingly under the spell of Ludwig Wittgenstein. In *Perception, Physics And Reality*, Broad had written that the only way of assessing a fundamental philosophical thesis is to see 'what would follow if it were true and then try to judge whether these results make that which implies them probable or improbable'. And he continued to regard philosophy as similar in this way to science: in his 'Reply', Broad still maintained that ' the philosophy of the physical world and of our perception of it [is] analogous in certain respects (though profoundly dissimilar in certain others) to the making and testing of a far-reaching scientific hypothesis' (Schilpp 1959). This conception of philosophy (now widely shared by many philosophers influenced, for example, by Quine) put him profoundly at odds with the 'Wittgersnappers', who saw thinkers such as Broad as conceptual delinquents in the grip of pseudo-problems, and recommended close attention to our ordinary language as appropriate therapy. But for Broad, 'in philosophy it is equally silly to be a slave to common speech or to neglect it'. And he always insisted that there is a proper place not just for Critical Philosophy - 'the analysis and definition of our fundamental concepts, and the clear statement and resolute criticism of our fundamental beliefs' - but also for Speculative Philosophy which hopes 'to reach some general conclusions as to the nature of the Universe, and as to our position and prospects in it'.

Much of his writing directly reflects Broad's conception of philosophy: like a judicious scientist, he weighs up the evidence for and against various theories, and then comes to a guarded verdict about their relative acceptability. The final chapter of *Mind and Its Place in Nature* is an extreme example, where he defines seventeen possible accounts of the relation between the mental and the physical, gradually whittles these down to a short list of three, finally judging one of them - 'emergent materialism' - as 'on all the evidence which is available to me… the most likely view'. In other hands this approach could make for tedium, but Broad writes with model clarity, and often with admirable elegance enlivened by flashes of mordant wit.

2 Perception

Broad discussed perception more often than any other topic. In particular, *Scientific Thought* contains a classic development of the sense-datum theory. When perceiving a stick half immersed in water, it looks bent; and ' the

most obvious analysis of the facts is that, when we judge that a straight stick *looks* bent, we are aware of an object [a 'sensum', to use Broad's preferred term] which really *is* bent, and which is related in a peculiarly intimate way to the physically straight stick'. Broad stresses that there are promising alternatives to this analysis of perceptual experience in terms of the apprehension of some special kind of transitory object. Still, in *Scientific Thought* he assumes that the sensum analysis is basically correct, and then explores how it should be developed in detail.

This approach has fallen into considerable disfavour since Austin's classic assault on sense-data theories, for example (see Austin, J.L. §2); but it would be wrong to conclude that there can now be nothing of interest in Broad's investigations. As he remarks in *Mind and Its Place in Nature*, 'a perceptual situation [such as seeing a cat] is "intuitive", while a thought-situation with the same kind of epistemological object [such as thinking of a cat] is "discursive"'. Judging *my cat is ginger* involves thinking of something as being a cat; but one can see a ginger cat without having the concept of a cat at all - the perceptual experience has, to use a later idiom, a non-conceptual content. And much of Broad's discussion of sensa can be read as an examination of such non-conceptual contents in a framework which need not presuppose that sensa are genuine 'objects'. For example, he revealingly investigates how our visual experiences interlock with our experiences of bodily movement and touch as we explore the world so as simultaneously to determine the rather different spatial characters of our visual and tactual perceptual contents.

Broad defends a refined version of Locke's account of our knowledge of the physical world (our experiences are caused by a world which, in certain respects, they resemble). But in *Scientific Thought*, Broad suggests that there is no conclusive proof to be had here. Rather, we can only indicate those facts about our sense experience 'which would give a high final probability to the belief in a physical world, provided it had a finite [non-zero] antecedent probability'. This probabilistic realism sharply distinguishes Broad from Russell, who at the time was aiming to 'construct' the external world from sense-data, rather than riskily infer it - and also from G.E. Moore, who was a realist but not a probabilist (see Perception §2; Sense-data §§1-3).

3 Induction

Another pregnant suggestion involving probability appears in Broad's early account of causality. In *Perception, Physics and Reality*, he examines some alleged difficulties about causation raised by idealist philosophers such as Bradley, and suggests that the way out is to hold that the proper form of a causal law is 'the occurrence of *X* at any moment increases the probability of *Y*'s occurrence at a moment τ later over what it would have been if *X* had not happened'.

But this novel proposal is not further explored (although in *Examination of McTaggart's Philosophy* Broad continues to make room for indeterministic causation). What Broad does concentrate on, in his many discussions related to probability, is the question of the character and justification of inductive reasoning. His long paper, 'The Relation Between Induction and Probability' ([1918] 1968), is noteworthy. Broad argues that inferences such as 'All observed *S*'s have been *P*: hence the next *S* will be *P*' are irreducibly probabilistic. However, he also argues that we cannot immediately apply to scientific inductions the results from probability theory that govern artificial situations like predicting the colour of a ball drawn from a bag. On certain assumptions we can show that if a random sample of *m* balls has proved to be all red, then the probability that the next ball out of the bag is red is $(m+1)/(m+2)$, so almost 1 when *m* is large. But we cannot carry over such a result in order to guarantee a high probability to the prediction that the next swan will be white, having observed many white swans, because the assumptions that apply in the artificial case do not apply in nature.

If an appeal to probability theory is not enough to warrant our induction here, what more is needed? Our most confident inductions are just those which deal with things that 'are believed to belong to what Mill would call a Natural Kind' (such as 'swan'): taking his cue from this, Broad argues that it is the real existence of natural kinds with characteristic causal powers which is required to underpin our inductive practices - and equally, is bound up with the very idea of a world containing 'continuants', that is, particular things that persist through time.

4 Time

Broad's *Examination of McTaggart's Philosophy* is a very detailed commentary on McTaggart's *Nature of Existenc*e (it concludes that 'none of McTaggart's more characteristic conclusions have been established by his

arguments', a persuasive verdict that still leaves Broad rating McTaggart alongside Leibniz as a speculative metaphysician). But it also contains a series of interwoven discussions in which Broad offers his own independent treatment of various issues. Perhaps the most impressive of these is 'The "Nature" of a Continuant', where Broad extends his work on kinds, arguing, for example, that the only way of making sense of counterfactual claims about what a given thing would have done if its circumstances had been different 'presupposes constancy of nature in individuals and the existence of natural kinds'.

However, the best-known part of *Examination of McTaggart's Philosophy* deals with time. We think of time as essentially involving change, and change as involving events that were still in the future becoming present, and then receding into the past - yet McTaggart famously argues that this conception leads to contradiction. Broad's analysis of McTaggart's reasoning here is definitive. 'He assumes that what is meant by a sentence with a *temporal copula* [such as 'is now', 'was', 'will be'] must be completely… expressible by a sentence or combination of sentences in which there is no temporal copula, but only temporal predicates and non-temporal copulas.' Thus, the truth that event *E will* occur consists in *E*'s having (timelessly!) the property of futurity. But eventually, the truth will be that *E is now* happening, so - on the same assumption - that different truth consists in *E*'s timelessly having the incompatible property of presentness. Contradiction ensues: hence, Broad concludes, we must reject McTaggart's tacit assumption that temporal copulas can be replaced by temporal predicates.

Broad also criticizes Russell's very different attempt to analyse away temporal copulas by treating, for instance, '*E* will occur' as meaning '*E* is later than this utterance' - where the 'is' is timeless. Broad argues that this theory requires us to conceive of past, present and future events as timelessly 'coexisting' in a way that it is impossible for us to render intelligible, or at least not compatibly with 'the fact that at any moment [certain events] are marked out from all the rest by the quality of presentness'. He concludes that tensed facts (as expressed using temporal copulas) are fundamental; or, in other words, 'Absolute Becoming' is an irreducible feature of the world. Broad's reasoning here is debatable - but his discussion remains a paradigm presentation of the 'tensed' view of time (see Tense and temporal logic).

5 Ethics

At the end of his widely read *Five Types of Ethical Theory*, Broad favours a mild form of ethical intuitionism; but later articles are non-committal. Indeed, in his 'Reply', when asked to commit himself on meta-ethical questions such as 'Do moral claims express *judgments* which are true or false?' or 'Are moral characteristics non-natural?', Broad confesses that he has 'no decided opinion'. On first-order questions, such as the merits of utilitarianism, Broad's usual philosophical caution is compounded by the belief that no single criterion of right action is likely to do justice to the complexity of our ethical lives. But lacking an axe to grind, his ethical discussions (if not especially original) are exceptionally careful and judicious, and remain valuable - where more recent writers have overlooked his writings, such as those on moral-sense theories, it has often been at the cost of labouring to rediscover distinctions already elegantly made by Broad.

PETER SMITH

List of works

Broad, C.D. (1914) *Perception, Physics and Reality*, Cambridge: Cambridge University Press.(Defends a Lockean causal theory of perception.)

Broad, C.D. (1923) *Scientific Thought*, London: Kegan Paul, Trench, Trubner & Co.(Part I - on space, time and motion - includes an excellent early treatment of the significance of the theory of relativity. Part II further develops the sensum analysis of perception.)

Broad, C.D. (1925) *The Mind and Its Place in Nature*, London: Kegan Paul, Trench, Trubner & Co.(Extended treatments of the unconscious and 'The Alleged Evidence for Human Survival of Bodily Death' are sandwiched between illuminating and influential discussions of the mind-body problem.)

Broad, C.D. (1930) *Five Types of Ethical Theory*, London: Kegan Paul, Trench, Trubner & Co.(Discusses Spinoza, Butler, Hume, Kant and Sidgwick: a textbook from before the era of textbooks, deservedly very widely used for many years.)

Broad, C.D. (1933, 1938) *Examination of McTaggart's Philosophy*, Cambridge: Cambridge University Press. (Over 1,250 pages, the 'mausoleum' in which Broad inters his admired teacher's philosophy contains some of his own most impressive work.)

Broad, C.D. (1952) *Ethics and the History of Philosophy*, London: Routledge & Kegan Paul.(Mostly reprinted historical papers; but includes his influential inaugural lecture 'Determinism, Indeterminism and Libertarianism'.)

Broad, C.D. (1953) *Religion, Philosophy and Psychical Research*, London: Routledge & Kegan Paul.(Further reprinted papers; 'The Relevance of Psychical Research to Philosophy' usefully sums up Broad's stance on the topic - he is far from credulous, but insists that it behoves philosophers to examine the evidence carefully, and not merely dismiss the possibility of psychic phenomena on shaky a priori grounds.)

Broad, C.D. (1962) *Lectures on Psychical Research*, London: Routledge & Kegan Paul.

Broad, C.D. (1968) *Induction, Probability and Causation*, ed. J. Hintikka, Dordrecht: Reidel.(Reprints Broad's important papers on these topics, including 'The Relation Between Induction and Probability' from *Mind* 1918, 1920.)

Broad, C.D. (1971) *Broad's Critical Essays in Moral Philosophy*, ed. D. Cheney, London: Allen & Unwin.(A comprehensive collection - includes the fine 'Some Reflections on Moral-Sense Theories in Ethics'.)

Broad, C.D. (1975) *Leibniz, An Introduction*, ed. C. Lewy, Cambridge: Cambridge University Press.(Edited from undergraduate lectures given in 1949-50: a useful student text, with a particularly good treatment of Leibniz's theory of corporeal substances.)

Broad, C.D. (1978) *Kant, An Introduction*, ed. C. Lewy, Cambridge: Cambridge University Press.(Edited by Lewy from lectures given in 1951-2: again, a very accessible and reliable student text.)

Broad, C.D. (1985) *Ethics*, ed. C. Lewy, Dordrecht: Nijhoff.(Broad lectured on ethics almost every year from 1933-4 to 1952-3, the evolving course providing the setting from which a number of his papers were excerpted: this book is edited from his final set of lectures.)

Schilpp, P.A. (ed.) (1959) *The Philosophy of C.D. Broad*, New York: Tudor.(Contains Broad's 'Autobiography', twenty-one critical essays - still overall the most useful discussions of his philosophy - and Broad's 'Reply to My Critics'. It also contains a detailed bibliography of Broad's publications up to 1959.)

Brown, Thomas (1778-1820)

Thomas Brown was the last prominent figure in the Scottish philosophical tradition deriving from David Hume and Thomas Reid. Like Reid, he took the mind's knowledge about itself to be a datum it is pointless to challenge or try to justify, since no other grounds can be more certain for us. But he defended Hume's account of causation as nothing more than invariable succession. The mind, therefore, is a simple substance, whose successive states are affected by and affect the states of physical objects: the laws according to which these changes take place are no harder to grasp than the effects of gravitation. Brown's lectures, published as delivered daily to Edinburgh students, seek to classify the laws of the mind so that we can conveniently understand ourselves, and direct our lives accordingly; the last quarter of his course draws conclusions for ethics and natural religion.

1 Life

Son of the minister of Kilmabreck, Thomas Brown was a precocious child who entered Edinburgh University in 1793 at 15, and after hearing Dugald Stewart's lectures in the following year submitted searching criticisms of them in writing (see Stewart, D.). He soon made a name in Edinburgh literary circles, and after abortive legal studies qualified as a medical doctor in 1803, submitting a thesis in Latin (which he was said to speak as fluently as English; his knowledge of modern European languages was also considerable). He entered medical practice, but kept up his philosophical interests, and when Stewart's health failed in 1809 Brown was made first his assistant and then his 'colleague' in the Edinburgh Chair of Moral Philosophy, in fact discharging all its duties until he himself fell ill in 1819. He died in the following year. His lectures, mostly written during the day before their first delivery, were highly thought of. They were published unrevised after his death, and throw an interesting light on his youthful student audience, being written in a powerful and complex Ciceronian style and peppered with quotations from a wide range of authors in Latin, French and Italian: Juvenal, Horace, Cicero and particularly Seneca are assumed to be familiar and are often not translated. He also quotes extensively from his favourite English poets, Alexander Pope and Mark Akenside. He published several volumes of his own ponderous poetry, in a similar style, which made little impact, but his lectures continued to be in demand (21st edition, 1851) until William Hamilton and idealism eclipsed the Scottish school; he has scarcely been remarked since.

2 Writings

Brown was one of the last notable exponents of the Scottish Common Sense School of philosophy, owing much to David Hume and Thomas Reid, but more to the former. His mature position is a substance dualism, in which Hume's 'theatre of the mind' has become a simple substance, the successive states of which - a series of 'feelings' - constitute its subject's mental life. His first publication, *Observations on the Zoonomia of Erasmus Darwin* (1798), an attack on the Zoonomia, was of little philosophical interest, but in his *Short Inquiry into the Nature of the Relation of Cause and Effect* (1803, much extended by the 3rd edition, 1818) he clarifies and purges Hume's view of causation. He defends Hume's account of causation as nothing but invariable succession, mounting a powerful attack on the notion of power, particularly that of unexercised power, as wielded by Reid. However, he also uses tools furnished by Reid: the world consists of substances; general terms are essentially abbreviations of lists of substances, suiting our own practical purposes, and descriptions are abstractions from states of those substances; we have by virtue of our nature some beliefs about the world that are not optional and are in no need of justification, and indeed could not be justified by anything more certain. Brown maintains, against Hume, that our belief that like antecedents are always followed by like consequences is just one such fundamental and pervasive belief; thus Hume's explanation of the effects of custom is out of place (experiments explore what the true causes of an effect are; we already believe there is some cause or other). He also mounts a vigorous demolition of Hume's whole impression/idea distinction, so as to detach belief from 'vivacity'; as a consequence Brown is able to combine bare Humean causal laws with complete absence of scepticism about both matter and God.

3 Philosophical outlook

Brown's philosophical acumen is better displayed in criticism of rival theories, through careful analysis and telling use of concrete examples, than in supporting his own. He was inclined (perhaps as a result of his scientific training, which he puts to good use as a source of examples) to apply Ockham's razor where possible, though not

at the expense of convenience - for example, he does not recommend that we should abandon speaking of powers, merely that we should be careful not to be taken in by the language which reifies them. Although he shares Reid's reliance on consciousness as our only evidence for the mind's operations, as well as Reid's use of first principles, he scoffs at multiplying 'powers' of the mind. Rather, the philosophical ambition should be to seek out and systematize the kinds of changes it invariably displays in various kinds of situation. His lectures, published under the title *Lectures on the Philosophy of the Human Mind* (1820), also promise practical benefits, since understanding the mind and its operations (and its limitations) will give us a better picture of our divinely appointed nature and destiny. The extensive range of rhetorical aids which so recommended him to his audiences is consciously deployed to this exhortatory purpose, particularly in the later lectures on ethics and natural theology.

For Brown, then, the mind is a simple substance, changes in which (throughout called 'feelings') follow changes in the bodily organs of sense, and vice versa. Its simplicity, and hence distinctness, enables him to fend off materialism: the bodily organs are mere aggregates of particles which our senses are too weak to distinguish and the physiological unity of which is a mere matter of descriptive convenience; but there cannot be half a thought at the northwest corner of the mind; therefore the mind is not the physical lump. Its distinctness also affords him an argument for immortality. The particles of the body are all conserved at death, being merely redistributed: why therefore, in the face of the obvious presumptions, should God see fit to single out the separate mental substance for destruction? Problems about how we can understand a causal relation between the physiological and the mental are put firmly aside: there is no a priori grasp of any causal relation (nothing about the look of gunpowder can tell you what will happen if you put a match to it), and so we must just observe what correlations actually obtain, as in any other science (gravitation's influence at a distance is at first sight equally problematic). It may well seem that this picture of the mind is open to Reid's criticisms of the theory of ideas (see Reid, T.§1); but Brown characteristically meets this doubt head on, arguing that Reid misguidedly took as literal what for most theorists since the collapse of Aristotelian real universals was merely convenient metaphor, and that, for such as Hume, 'ideas' in the proper sense were not the *object* of mental attention but its vehicle.

However, like Reid, Brown claims that our knowledge of things is through their properties, that is, how they behave. So the mind can be considered as effect and cause of contemporary states of other substances and as itself a succession of states. Although at any given moment its state is simple, this can be analysed, like a chemical substance, into the result of simpler inputs. 'Consciousness' does not name a separate power, but is a generic name for every kind of feeling - that is, mental awareness; nor is perception distinct from sensation. Abandoning previous ways of classifying mental operations, Brown deals first with changes in the mind which we discover to depend on outside causes (in our organs) and then with those which the mind itself produces. It emerges that though belief in a 'permanent external system of things' is for adults not optional, it may be explainable in terms of early experience. He speculates at length about the way in which kinaesthetic sensations may provide the associations with vision which can account for how the infant solves George Berkeley's problem of deriving spatial information from colours (see Berkeley, G.).

The affections of the mind caused by its own internal states Brown describes in terms of ingeniously various laws of 'suggestion': the extensive and detailed discussions of particular emotions are full of interest. Like Reid, Brown takes care to avoid regressive accounts: the mind cannot aim at producing a volition without circularity, and so desires and 'volitions' differ only as long-term and short-term states, causing effects in muscular action. The resulting ethics is a moral-sense account reminiscent of Francis Hutcheson's, classifying moral feelings towards human agents separately from the other emotions (see Hutcheson, F. §2). This requires, and delivers, criticism of Adam Smith's rival account (see Smith, A.), but Brown is really more interested in classifying our duties and reminding us at full oratorical stretch of the powerful motives in human nature for fulfilling them.

Browne, Peter (1666-1735)

Peter Browne, an Irish bishop, was a critic of Locke's theory of ideas. His chief philosophical concern was to explain how human beings can conceive of God. He proposed that God's existence and attributes can be understood analogically, by their real - though inevitably partial - resemblance to human things. He distinguished between analogy, which turns on a 'real resemblance', and metaphor, which turns on a merely imagined one.

Browne entered Trinity College Dublin in 1682 and became a fellow in 1692. He served as provost of Trinity from 1699 until 1710, when he became Bishop of Cork and Ross in the south of Ireland. George Berkeley was a student and fellow at the college during Browne's tenure as provost. Years later, in the Fourth Dialogue of *Alciphron*, Berkeley, without naming Browne, attacked his analogical theology (see Berkeley, G. §11). He took Browne to be denying that we have any notion at all of God's attributes. Browne's angry reply occupies the long final chapter of his *Things Divine and Supernatural* (1733).

Browne's first publication of philosophical interest was his *Letter* (1697) on John Toland's *Christianity Not Mysterious* (1696) (see Toland, J.). Relying on a simple version of the doctrine of analogy elaborated in his later works, Browne argues that although religious mysteries can be understood only in part, they *can* be understood and can therefore be believed. He also argues that they can be believed with good reason. It is perfectly legitimate to trust informants we know to be truthful and able, even if we cannot fully comprehend what they relate. And if their authority is confirmed by miracles our 'evidence or degree of knowledge' will mount even higher.

Browne's main philosophical work, *The Procedure, Extent, and Limits of Human Understanding* (1728), is in part a logic textbook meant to correct 'the false and Pernicious principles in some of our modern Writers of Logic and Metaphysics' (1728: 34). John Locke is the foremost example (see Locke, J. §§3-6). Like John Sergeant, Browne rejects Locke's definition of knowledge as perception of the agreement or disagreement of ideas. 'The Word *Idea*,' he writes, 'should be limited and confined to our simple Sensations only', and to the 'various Alterations and Combinations of them' which he calls 'compounded ideas' (1728: 63). Compounded ideas differ from 'complex notions' or 'conceptions', in which ideas are combined with an immediate consciousness of the mind's operations and affections. Locke's over-broad use of the word 'idea' is, Browne suggests, one sign of his tendency to overestimate the mind's passivity. Another is Locke's denial, in his assault on the syllogism, of 'all true *Illation*, or the *Actual* infering one thing from another' (1728: 422). Instead Locke gives us 'a mere naked *juxta-Position* of Ideas' (1728: 422).

Browne's mature doctrine of analogy is presented in the *Procedure*, but it is spelled out more fully in *Things Divine and Supernatural* (1733). The doctrine rests on a distinction between analogy and metaphor. In each case we use one idea or conception to stand for another. But in analogy there is a 'real resemblance' or 'true correspondence' between the terms; in metaphor the resemblance is merely imagined. In what Browne calls 'human' analogy, each term is known - or knowable - directly; it follows that 'human' analogy can, at least in principle, be paraphrased away. In 'divine' analogy, the second, divine term cannot be known directly. Divine analogy is therefore 'necessary' or inescapable, if things divine are to be understood at all. 'Thus we contemplate things *Supernatural*', as he had written in the *Procedure*, 'not by looking directly *Upward* for any *Immediate View* of them; but as we behold the heavenly Bodies, by casting our Eyes *Downward* to the *Water*' (1728: 425).

Brunner, Emil (1889-1966)

Emil Brunner was one of the most influential Protestant theologians of the twentieth century. He was a minister of the Swiss Reformed Church, a professor at the University of Zurich, and held distinguished lectureships in England, the USA and Japan. He joined the 'dialectical school' early in his career, but tried to rehabilitate natural theology, which led to a rift with Barth. His works were widely read and often served as basic texts in Reformed and Presbyterian seminaries. He rejected the historicist reduction of Christ to a wise teacher figure that was characteristic of neo-Protestantism. He was also critical of modern philosophical anthropologies - as propounded by Marx or Nietzsche, for example - because he felt that they reduced human essence to a single dimension. Only theological anthropology can fully interpret human essence; and of central importance here is the 'I-Thou encounter', whereby the fulfilment of the human 'I' is achieved through a relationship with the divine 'Thou'. Brunner also unfolded an original view on the relation of theology to philosophy. Reason, he argued, is essential for the elucidation and communication of faith. Philosophy, in so far as it indicates the limitations of reason, can serve to prepare us for the revelation of the Absolute.

1 Theology of crisis

Emil Brunner was born in Winterthur in Switzerland. His religious and theological education was marked by three main influences: a socio-eschatological, a historico-critical and a phenomenological. The first of these was mediated through his father, who was acquainted with religious socialism and especially enthralled by Christoph Blumhardt's eschatological message. He also read Hermann Kutter and Leonhard Ragaz and studied Herknew's and Sombart's socio-economic works. At the University of Zurich, Brunner received a solid training in the historico-critical method. His teachers were liberals, and one of them, Walter Köhler, was a disciple of Ernst Troeltsch. In 1911, he spent a semester in Berlin, where he attended Adolf von Harnack's lectures. The phenomenological influence manifested itself when Brunner, searching for a rigorous formulation of Christian belief, read first Kant, and then discovered Edmund Husserl.

After a year in England (1913-14), where he frequented the Christian Labour Movement and the Brotherhood Movement, he received his doctorate in theology in Zurich. His dissertation examined the use of symbol in religious knowledge. Brunner took his theme from Kant and Bergson and his method from Husserl (§§2, 6). As knowledge of a higher world, religious knowledge is inherent in the consciousness of ethical norms. In the wake of Kant (§11), Brunner's theologizing process proceeded from ethics to faith.

The First World War destroyed Brunner's hopes for a better world. Blumhardt's belief in the imminent coming of the kingdom of God, to which Brunner had held, was shattered dramatically. Like Karl Barth, Brunner turned back to the foundations of Christian doctrine and action. He spent a year of research at Union Theological Seminary in New York (1919-20), then, in 1921, defended his *Habilitationsschrift* at the University of Zurich, which led to his appointment there the following year; in 1924, he took the chair of systematic and practical theology. It was at this time that Brunner discovered Barth's *Der Römerbrief (The Epistle to the Romans)* (1919) and joined the 'theologians of crisis' contributing regularly to the journal *Zwischen den Zeiten (Between the Times)* (see Barth, K. §§1-2). He subsequently became a major exponent of 'the theology of crisis'. Like Barth, Brunner found inspiration in Kierkegaard's warning against the accommodation of Christian faith to human culture (see Kierkegaard, S.A. §§4-5). His main concern was to restore the sovereignty of God. Thus he centred theology on the gospel of sin and grace while emphasizing the infinite qualitative distinction between God - the Wholly-Other - and human beings. Brunner denied human beings any natural knowledge of God, whether by reason, feeling or will; the knowledge of God is exclusively supernatural. Faith in revelation is the sole medium for our knowledge of God. Brunner insisted on the primacy of biblical revelation.

Having returned to the supernaturalism of the sixteenth-century Protestant Reformation, Brunner launched a spectacular offensive against neo-Protestantism, or liberalism. *Die Mystik und das Wort (Mysticism and the Word)* (1924) distinguishes Christian faith from the modern understanding of religion, as exemplified by Friedrich Schleiermacher (§7); *Der Mittler (The Mediator)* (1927) claims allegiance to Nicene and Chalcedonian Christology. Brunner defended the divinity of Christ the Mediator against the lives of Jesus presented by the historicizing and psychologizing schools of the nineteenth century. What he most disapproved of in

neo-Protestantism was the reduction of Christ to a wise teacher or a heroic figure, the identification of progress with divine providence, and uncritical confidence in human nature.

2 Eristic and natural theology

In 1929, Brunner published a programmatic article, ‘Die andere Aufgabe der Theologie’ (The Other Task of Theology), which presaged the coming break with Barth. Responding to an epistemological, a missionary and an ethical motive, Brunner’s theology was shifting from the content of revelation (the ‘what’) to the appropriation of revelation (the ‘how’). Whereas expounding God’s revelation in Christ through Scripture defines the first theological task, the second one consists in clearing the path for its appropriation by human beings. Brunner called ‘eristic’ the type of apologetics that stresses the delusion of reason; he claimed to have borrowed this theology from Pascal, Hamann and Kierkegaard. An article entitled ‘Die Frage nach den "Anknüfungspunkt" als Problem der Theologie’ (The Question of the ‘Point of Contact’ as a Theological Problem) (1932) argues in favour of an innate human disposition to the divine. In it, Brunner contends that the Word of God does not encounter a passive, unresponsive being, but a thinking subject, a responsive and responsible person. Brunner called the ‘point of contact’ that which corresponds in epistemology to the human ability to hear and respond to God’s revelation, in anthropology to the infralapsarian image of God, and in ethics to evil conscience.

The rehabilitation of natural theology, though of a different kind, came in 1934. Brunner’s essay ‘Natur und Gnade’ (Nature and Grace) prompted Barth’s uncompromising censure (1935). The dispute culminated in a rupture between the two, though Brunner did not advocate a Roman Catholic type of natural theology. For Brunner, natural theology serves a threefold purpose: to ground personal and social ethics; to provide a philosophical substructure to dogmatics; and to enable Christian preaching and education. It lays the foundation for expositions of revelation. Brunner drew a distinction between subjective natural theology (Roman Catholic) and objective natural theology (Scripture and Calvin). Whereas the former implies the natural knowability of God, the latter consists only in a gnoseologically inoperable general revelation. Sin has disconnected the knowledge of God from general revelation. Hence Brunner argued that God’s special revelation in Christ constitutes the source of knowledge for God’s general revelation in nature, history and human consciousness. Contrary to Roman Catholic natural theology, Brunner’s so-called ‘Christian natural theology’ claims to preserve a Christocentric gnoseology. Notwithstanding this, Barth felt that Brunner’s call for a rehabilitation of natural theology in Christian theology disrupted the post-Reformation emphasis on faith.

3 Theology of encounter

Brunner made ample use of the psychological-anthropological ‘I-Thou’ relationship in all his major works, including *Das Gebot und die Ordnungen (The Divine Imperative)* (1932), *Der Menschen im Widerspruch (Man in Revolt)* (1937), *Wahrheit als Begegnung (Truth as Encounter)* (1938), *Offenbarung und Vernunft (Revelation and Reason)* (1941) and the three-volume *Dogmatik* (1946-60), which unfolds a liberal, modernized version of Reformed theology. The I-Thou relationship was borrowed from the personalist philosophy of existence that Martin Buber (§4) and Ferdinand Ebner professed. In *Man in Revolt*, Brunner argues that all philosophical anthropologies, whether realist (Aristotle), idealist (Plato), pantheist (Stoics) or naturalist (Darwin), provide a distorted image of the human being because of their false interpretation of human essence. The leading philosophical anthropologies of our time, namely those of Darwin, Nietzsche, Marx and Freud, reduce human essence to a single principle and thus fail to account for human reality as a whole. Only theological anthropology, which is biblical, Christocentric and based on faith, correctly explains human essence. Theological anthropology deals with human responsibility. The Word of God is the source of theological anthropology and also makes it knowable by us. Thus a human being is not only a sensitive and thinking subject, but also an ‘I’ whose fulfilment depends on a relationship to the human-divine ‘Thou’. For Brunner, this scheme offers an escape from the traditional alternatives of objective or subjective anthropology. For the truth of faith is neither an objective nor a subjective truth but ‘truth as encounter’. Likewise, revelation is not the disclosure of supernatural facts or truths, but God’s self-revelation. The truth of revelation is thus also ‘truth as encounter’. The knowledge of faith is understood as a synthetic theory that removes the contradictions of human thought and life. Life without Christ is life in contradiction.

4 Faith and reason

From the vantage point of Christian theology, the relationship between faith and reason concerns three things: the use of philosophical terminology, the auxiliary function of philosophical analysis, and the legitimacy of the philosophical endeavour (see Faith §§4-5). Like Barth, Brunner occasionally used philosophical concepts. Divine revelation cannot avoid human reason nor is it fundamentally opposed to reason. For reason is the quintessence of a human being's natural ability to know: it is the capacity to conceive and to formulate ideas. Thus faith needs reason for its rational elucidation; it is a matter of understanding and communication. Consequently, the employment of reason is essential to Christian education. Brunner viewed reason (*Vernunft*) not merely as understanding (*Verstand*) but also as part of the image of God. Whereas understanding is limited to finite and objective knowledge, reason is the power to transcend, to relate to the beyond. The use of philosophical terminology is necessary and legitimate, and may go as far as a partial or global appropriation of a philosophical scheme; an example is the 'I-Thou' relationship, which enables theological discourse to avoid dualism without falling into monism.

The issue of whether philosophy should be regarded as the handmaid of theology was much debated among the 'theologians of crisis'. Rudolf Bultmann (§§2-3) favoured this type of relationship, whereas Barth disapproved of it. In *Erlebnis, Erkenntnis und Glaube (Experience, Insight and Belief)* (1921), his *Habilitationsschrift* for Zurich, Brunner advocated a constructive relationship between theology and a type of philosophy that he labelled 'philosophy of origin' (*Philosophie des Ursprungs*). Critical and deconstructive, the 'philosophy of origin', as developed by Plato, Descartes and Kant, emphasizes and respects the finitude of human nature. It is an inverted science, which postulates the idea of a world beyond, an original and absolute other world, but acknowledges the limitations of this idea. Thus, the 'philosophy of origin' can be a valuable auxiliary to Christian faith. By stressing the inadequate outcome of all rational endeavour, the 'philosophy of origin' prepares human beings to receive the Absolute as ultimate principle and meaning, and thereby clears the path for the 'miracle' of God's Word, namely for revelation and faith. As a preparation for faith, the 'philosophy of origin' functions as a handmaid to theology.

Regarding the legitimacy of philosophical endeavour, Brunner justified and restricted it. In *Revelation and Reason*, he enunciated a law of contiguity which allows for a Christian philosophy. The choice is no longer between theology and philosophy but between existential faith and philosophical and theological reflection. In faith as encounter, faith restores reason's original purpose. Whereas reason provides access to an objective, impersonal, universally valuable truth, faith, as encounter with the divine 'Thou', is given a valid and life-transforming truth. In faith as encounter, the believing/knowing subject does not acquire the knowledge of an objective and objectifiable truth, but becomes God's possession. Finally, faith and reason together build a dialectical relationship similar to the dialectic of Law and Gospel.

List of works

Brunner, E. (1979-) *Emil Brunner: Werke (Collected Works)*, ed. R. Wehrli, Zurich: Theologischer Verlag. (Multiple volumes, still being produced.)

Brunner, E. (1921) *Erlebnis, Erkenntnis und Glaube (Experience, Insight and Belief)*, Tübingen: Mohr. (Brunner's *Habilitationsschrift*, in which he advocates the 'Philosophy of Origin', which can do justice to human finitude and thus fit with theology.)

Brunner, E. (1924) *Die Mystik und das Wort: der Gegensatz zwischen moderner Religionsauffassung und christlichen Glauben, dargestellt an der Theologie Schleiermachers (Mysticism and the Word: The Conflict between Modern Religious Belief and Christian Faith, with Reference to the Theology of Schleiermacher)*, Tübingen: Mohr.(Like Karl Barth, Brunner defined himself to some extent over against Schleiermacher, particularly in this work.)

Brunner, E. (1927) *Der Mittler: Zur Besinnung über den Christusglauben*, Tübingen: Mohr; trans. O. Wyon, *The Mediator: A Study of the Central Doctrine of the Christian Faith*, London: Lutterworth, 1934.(A lengthy presentation of Brunner's broadly orthodox Christology.)

Brunner, E. (1929) 'Die andere Aufgabe der Theologie' (The Other Task of Theology), *Zwischen den Zeiten* 7. (Theology must, *pace* Barth, ask how revelation is humanly appropriated - this is its other task.)

Brunner, E. (1932a) 'Die Frage nach den "Anknüfungspunkt" als Problem der Theologie' (The Question of the 'Point of Contact' as a Theological Problem), *Zwischen den Zeiten* 7.(The question of the human reception of revelation led Brunner to a break with Barth through positing a fundamental human receptivity: the *Anknüfungspunkt* of the title.)

Brunner, E. (1932b) *Das Gebot und die Ordnungen: Entwurf einer protestantisch-theologischen Ethik (The Law and the Rules: Outline of a Protestant Theological Ethics)*, Zurich: Zwingli-Verlag, 4th edn, 1939; 2nd edn trans. O. Wyon, *The Divine Imperative: A Study in Christian Ethics*, London: Lutterworth, 1937.(An ethics consonant with Brunner's focus on the encounter between God and fallen humanity, and Protestant ambiguity about 'law'.)

Brunner, E. (1934) 'Natur und Gnade: zum Gespräch mit Karl Barth', *Theological Existenz heute* 14; trans. P. Fraenkel, 'Nature and Grace', in K. Barth and E. Brunner, *Natural Theology*, London: Geoffrey Bles, 1946. (Brunner suggests a rehabilitation of natural theology as preparatory work for theology. The article prompted, and in English is printed with, Barth's famous published reply, 'Nein!')

Brunner, E. (1935) *Unser Glaube: Eine Christliche Unterweisung*, Bern and Leipzig: Gotthelf Verlag; trans. J.W. Rilling, *Our Faith*, London: SCM, 1949.(A brief and simple guide to Brunner's understanding of credal Christian faith.)

Brunner, E. (1937) *Der Menschen im Widerspruch: die christliche Lehre von wahrem und von wirklichen Menschen (Man in Revolt: The Christian Doctrine of True Man and of Man as He Appears in the World)*, Berlin: Furche-Verlag; trans. O. Wyon, *Man in Revolt: A Christian Anthropology*, London: Lutterworth, 1939. (Despite his strong natural theology, Brunner retained a deeply Protestant view of fallen humanity, best seen in this book.)

Brunner, E. (1938) *Wahrheit als Begegnung*, Zurich: Zwingli-Verlag; trans A.W. Loos, *Truth as Encounter*, London: SCM, 1964.(An earlier, incomplete translation was published as *The Divine-Human Encounter* (London: SCM, 1944), but the original German title captures the 'paradoxical' subject-matter best.)

Brunner, E. (1941) *Offenbarung und Vernunft: die Lehre von der christlichen Glaubenserkenntnis*, Zurich: Zwingli-Verlag; trans. O. Wyon, *Revelation and Reason: The Christian Doctrine of Faith and Knowledge*, London: SCM, 1947.(Deals with broadly epistemological issues, and the foundation of faith in revelation.)

Brunner, E. (1943) *Gerechtigkeit: eine Lehre von den Grundgesetzen der Gesellschaftsordnung (Justice: A Study of the Foundations of the Social Order)*, Zurich: Zwingli-Verlag; trans. M. Hattiger, *Justice and the Social Order*, London: Lutterworth, 1945.(Brunner's constant social-ethical emphasis is most explicit in this work on the nature of society and the justice which must lie at its heart.)

Brunner, E. (1946-60) *Dogmatik*, Zurich: Zwingli-Verlag, 3 vols; trans. O. Wyon (vols 1 and 2) and D. Cairns (vol. 3), London: Lutterworth, 1949-62.(Volume 1: the doctrine of God; volume 2: the doctrines of creation and redemption; volume 3: the doctrines of Church, faith and 'the consummation'.)

Brunner, E. (1947-8) *Christianity and Civilization*, London: Nisbet, 2 vols.(Brunner's Gifford Lectures, originally published in English.)

Bruno, Giordano (1548-1600)

Giordano Bruno was an Italian philosopher of nature and proponent of artificial memory systems who abandoned the Dominican Order and, after a turbulent career in many parts of Europe, was burned to death as a heretic in 1600. Because of his unhappy end, his support for the Copernican heliocentric hypothesis, and his pronounced anti-Aristotelianism, Bruno has often been hailed as the proponent of a scientific worldview against supposed medieval obscurantism. In fact, he is better interpreted in terms of Neoplatonism and, to a lesser extent, Hermeticism (also called Hermetism). Several of Bruno's later works were devoted to magic; and magic may play some role in his many books on the art of memory. His best-known works are the Italian dialogues he wrote while in England. In these Bruno describes the universe as an animate and infinitely extended unity containing innumerable worlds, each like a great animal with a life of its own. His support of Copernicus in La Cena de le ceneri (The Ash Wednesday Supper) was related to his belief that a living earth must move, and he specifically rejected any appeal to mere mathematics to prove cosmological hypotheses. His view that the physical world was a union of two substances, Matter and Form, had the consequence that apparent individuals were merely collections of accidents. He identified Form with the World-Soul, but although he saw the universe as permeated by divinity, he also believed in a transcendent God, inaccessible to the human mind. Despite some obvious parallels with both Spinoza and Leibniz, Bruno seems not to have had much direct influence on seventeenth-century thinkers.

1 Life

Giordano Bruno was born in Nola, near Naples, and frequently called himself 'the Nolan'. His baptismal name was Filippo, and he adopted the name 'Giordano' on entering the Dominican Order in 1565. He fled from the Dominicans in 1576 on learning that he was to be accused of heterodox views, and wandered in Italy for a while, supporting himself by private teaching and tutoring. By 1579 he was in Geneva, where the municipal records show that he petitioned against a denial of participation in the Calvinist sacraments. This denial was apparently the result of Bruno's attack on a leading philosopher, which also led to brief imprisonment. Next he went to France, finally settling in Toulouse, where he lectured on Aristotle's *On the Soul*. He was in Paris 1581-3, where his lectures attracted the attention of Henri III. From 1583 to 1585 he was in London, staying at the house of the French ambassador, Michel de Castelnau. Unknown to Castelnau, Bruno was probably a spy, reporting to Sir Francis Walsingham, Elizabeth I's secretary, about the plots of the English Catholics (see Bossy 1991). He had an unfortunate experience in Oxford in 1583, being forced to abandon a series of lectures when a member of the audience pointed out that he was plagiarizing the works of Ficino. When Michel de Castelnau was recalled to Paris at the end of 1585, Bruno went with him. After some problems there, including opposition roused by a disputation in which his view of the universe was defended by a pupil, he turned to the German Protestant universities. In 1586 he went to Marburg, and matriculated at the university there but (as the Rector has recorded) angrily withdrew his name when denied the right to teach philosophy publicly. He then went to Lutheran Wittenberg, where he was allowed to lecture. In 1588 he visited the court of Rudolph II in Prague, and then went to Helmstadt, where he seems to have been excommunicated by the Protestants. In 1590 he was resident in the Carmelite monastery in Frankfurt. At this point he was invited by a Venetian nobleman, Zuan (a form of 'Giovanni') Mocenigo, to go to Venice and teach him the art of memory, and he took up the invitation in the autumn of 1591. In May 1592 Mocenigo, perhaps disappointed at what he had learned, handed Bruno over to the Venetian Inquisition. The following year they handed Bruno over to the Roman Inquisition. A long sequence of interrogations followed. In the end he refused to recant, though the list of final charges is not known. Despite the fact that heretics were normally strangled in prison and burned only in effigy, Bruno was burned to death on February 17, 1600, in the Campo dei Fiori in Rome.

2 Works

Bruno was an extremely prolific writer who wrote more than fifty works and opuscula, of which nearly forty, all from the period 1582-91, are now available in print. He wrote one comedy, *Il Candelaio (The Torch-Bearer)* (1582a), which influenced Molière, and several didactic and critical works. His works on magic, probably written in Helmstadt, were all unpublished during his lifetime. His most significant works include those on the art of memory and Ramon Llull's combinatory method. His first surviving work on these (or any other) issues is *De*

umbris idearum (On the Shadows of Ideas) (1582b), published with *Ars memoriae (On the Art of Memory)*. In 1583 there followed four works in one volume: *Ars reminiscendi (On the Art of Remembering)*, *Explicatio triginta sigillorum (The Explanation of the Thirty Seals)*, *Sigillus sigillorum (The Seal of Seals)*, and a letter to Oxford setting out his claims to be heard. Another work in the same series is *Lampas triginta statuarum (The Lamp of Thirty Statues)* (*c*.1587).

Much of Bruno's fame rests on his six Italian dialogues. The cosmological dialogues are: *La Cena de le ceneri (The Ash Wednesday Supper)* (1584a); *De la causa, principio et uno (Cause, Principle and Unity)* (1584b); *De l'infinito universo et mondi (On the Infinite Universe and Worlds)* (1584c). The moral dialogues are: *Spaccio della bestia trionfante (The Expulsion of the Triumphant Beast)* (1584d), modelled on the satirist Lucian; *Cabala del cavallo Pegaseo con l'aggiunta de l'Asino cillenico (The Kabbalah of the Pegasean Horse with an Appendix on the Cillenican Ass)* (1585a); *De gl'Heroici Furori (The Heroic Frenzies)* (1585b), a sonnet sequence with prose commentaries.

The final version of Bruno's philosophical and cosmological speculations is found in three Latin poems with prose accompaniment, published in 1591: *De triplici minimo et mensura (On the Threefold Minimum and Measure)*; *De monade, numero et figura (On the Monad, Number and Figure)*; *De innumerabilibus, immenso et infigurabili (On the Innumerables, the Immense and the Infigurable)*.

Bruno was never a professional philosopher with a permanent university post, a fact which helps explain both his chaotic style of writing and his exploration of various literary forms. He did not write organized textbooks, and there is little close argumentation or precise definition in his works. On the other hand, particularly in his dialogues, he is witty, bawdy, disputatious and hostile. Women are 'a chaos of irrationality' ([1584b] 1964: 118); his contemporary Patrizi is that 'excrement of pedantry, who has soiled many quires with his Peripatetic Discussions' ([1584b] 1964: 99); Oxford doctors, who know beer better than Greek, are characterized by 'discourteous impoliteness and brazen ignorance' ([1584a] 1975: 142). His invective is balanced by elaborate praise of 'the Nolan', who has 'set free the human spirit and cognition' ([1584a] 1975: 60).

One feature of Bruno's style that seems particularly strange to modern readers, is his elaborate, extravagant, use of verbal descriptions of images, seals and emblems (symbolic devices representing abstract qualities, astral powers and so on). These devices are often arranged in groups of thirty, though *The Expulsion of the Triumphant Beast* is organized around forty-eight constellations, each linked to a vice which is to be expelled and replaced by the contrary virtue.

The influences on Bruno's work are manifold. As a Dominican, he had studied Thomas Aquinas, whom he greatly admired, and Thomistic distinctions and categories still pervade his works. Obviously he knew Aristotle well, though he is generally opposed to his views. He frequently refers to the Presocratics (see Presocratic philosophy), and also to Lucretius, but his general framework is Neoplatonic. Plato and Plotinus are of particular importance, along with the *Corpus Hermeticum*, Ibn Gabirol and Nicholas of Cusa. Bruno also made much use of Ramon Llull, Marsilio Ficino and Agrippa von Nettesheim (§5), especially Agrippa's *De occulta philosophia* (1533).

3 Memory and magic

The art of memory, which grew out of rhetoric, had a long history (see Memory §1). It developed rules for the cultivation of so-called artificial memory. These rules focused on places and images. First, one should imagine a place, such as a house with several rooms; then one should place images in each room. Later, by wandering in thought through the rooms, one would be enabled to remember the topics or things associated with each image. Bruno was trained in this tradition, but when he went to Paris, he became acquainted with Ramon Llull's combinatory art, which involved using letters and figures to represent basic concepts, and writing them on moving wheels in order to make new combinations (see Llull, R. §2). Bruno adapted Llull's technique by employing images and emblems in place of mere letters. On turning the concentric wheels, one could relate the images in various ways and multiply the triggers of memory, as well as the complexity of what was represented.

Bruno's use of images has been linked to magic and Hermeticism (or Hermetism) as well as to the privileging of the imagination in epistemology. On the traditional view, the imagination was taken to be one of the inner senses, and had two functions, the forming of images which help us to retain sense impressions in memory, and the manipulation of images to form images of things never experienced, such as a golden mountain. Given a realist

epistemology, images both reflected the outer world and formed a basis for the operations of the intellect. Bruno seems not to have departed from this account, and while he naturally emphasized the imagination when speaking of artificial memory, his other accounts of the human search for knowledge always subordinate the imagination to the intellect. The noetic process is triggered by sense perception, and involves an ascent beyond the imagination to as much understanding as the human mind can achieve. In *The Heroic Frenzies* Bruno emphasizes that love is the stimulus, and that the final ascent to union with God through understanding is unattainable in this life. There are difficulties with Bruno’s epistemology, in that it is not always clear how much room is assigned to illumination from above, or how it is that human notions (the ‘shadows of ideas’) reflect the divine ideas that structure the world without being innate, but it is not the case that his account of cognition is reducible to his account of the imagination.

The link between magic and the art of memory can be explained by appeal to Bruno’s realist framework, together with the premises that symbols and reality are linked and that knowledge as such has operative force. If external symbols and internal images represent not just the world but the natural forces which pervade it, the magician can achieve mastery of these natural forces by increasing his ability to represent them. Not only that, he can even influence others by projecting images into their minds. While Bruno’s works on magic were all written at the end of his literary activity, he does speak of natural magic (as opposed to black magic) approvingly in *The Expulsion of the Triumphant Beast*. He describes the cult of the ancient Egyptians as ‘magic and divine’ ([1584d] 1964: 239), and says that their ‘magic and divine rites’ provide a way of ascent ‘to the Divinity by means of the same ladder of Nature by which Divinity descends even to the lowest things in order to communicate herself’ ([1584d] 1964: 236).

Frances Yates links both these references to magic and Bruno’s praise of the ancient Egyptian religion to the *Corpus Hermeticum*, a group of writings dating from AD 100 to AD 300, and attributed to the mythical Egyptian sage Hermes Trismegistus. She argues that Bruno’s main aim in all his writings was to preach Hermeticism, and to establish it as the one true religion. Although her thesis is overstated, it does provide a way of reconciling Bruno’s works on memory and magic with his more directly philosophical works (see Hermetism).

4 Cosmology

Bruno is best known for his championship of Copernicus in *The Ash Wednesday Supper*. In *De Revolutionibus Orbium Coelestium (On the Revolutions of the Heavenly Spheres)* (1543), Copernicus had argued both that the earth had its own daily rotation, and that it rotated around the sun (see Copernicus, N.). These theses challenged Aristotelian cosmology, but the force of the challenge was recognized only gradually. It was not until 1616 that *De Revolutionibus* was put on the Index of books forbidden by the Roman Catholic Church, and ironically, it may have been in part Bruno’s defence of Copernicus that led to this result, for he pointed out that Copernicus’ theory was inconsistent with the standard ways of interpreting the Bible at that time. Bruno took Copernican cosmology more seriously and less metaphorically than Yates suggests when she writes ‘The sun-centred universe was the symbol of Bruno’s vision of universal magical religion, inspired by the works of "Hermes Trismegistus"’ (Yates 1982: 219). Nonetheless, it is true that Bruno showed little interest in the mathematical basis of Copernicus’ work. He criticized Copernicus for ‘being more intent on the study of mathematics than of nature’ ([1584a] 1975: 57), a point which ties in with his other attacks on mathematics, and his emphasis on numerology in such writings as *De monade*. Moreover, Bruno got some of the technical details wrong, perhaps because he was drawing on the writings of a French bishop, Pontus de Tyard, who was favourable to Copernicus, but muddled.

In both *The Ash Wednesday Supper* and *On the Infinite Universe and Worlds* Bruno makes a series of cosmological claims that owe much to Lucretius and Nicholas of Cusa. First, the universe is infinite, which means that it can have no centre, though there are many world-systems each of which may have its own centre. Second, these worlds may be inhabited. Third, the stars can be regarded as suns, that is, as self-luminous bodies, and they should not be seen as fixed on spheres. Fourth, the earth is made of the same stuff as the other worlds: there is no difference of kind between the sublunar realm and the heavenly realms, as Aristotelians argued. Finally, the celestial bodies that constitute the universe are ‘intelligent animals’ ([1584a] 1975: 46). Indeed, it is because the earth is animate that it must rotate. It has an ‘innate animal instinct’ ([1584c] 1950: 266), and there is no need to postulate extrinsic movers.

5 Metaphysics

Bruno's main argument for the infinity of the world relied on his view of God as infinite in power and goodness. Goodness diffuses itself, and the only appropriate product of infinite power must itself be infinite. He went on to give an account of the created world in largely Neoplatonic terms. In *De umbris idearum* he claims that all things are ordered and connected, and he presents a fairly standard account of the 'ladder of nature' (*scala naturae*, or the Great Chain of Being), with pure act or infinite unity at the top and matter or infinite number at the bottom. The intelligences or pure spirits come below God, followed by the corporeal world, with soul as an intermediary.

The theme of the ladder of nature goes together with two other themes, the division into three worlds (found in the *Corpus Hermeticum*), and the Neoplatonic scheme of *exitus* and *reditus*, or going out and coming back, ascending and descending. The three worlds are described in *Sigillus sigillorum*. The first world is the *fons idearum* (the fount of ideas) which is God himself as containing the divine Ideas by which the created world is structured; the second is the *mundus ideatus*, the created world; and the third is the human mind which reflects the created world. Just as God's power flows down the ladder of nature, creating the third world through the second, so human contemplation ascends the ladder, knowing the first world through the second.

This Neoplatonic schema was considerably complicated by Bruno's account of matter in *Cause, Principle and Unity*. While he retained Aristotle's account of physical reality in terms of form and matter, he attacked Aristotle's view of prime matter as purely receptive and devoid of form. Rather, matter contains all things within itself, and 'unfolds what it holds folded-up' ([1584b] 1964: 131). Forms both desire and need matter. In language very reminiscent of Ibn Gabirol (§2), Bruno developed his theory by claiming that there are just two substances (apart from the transcendent God, who is the only genuine substance), namely Matter and Form, and these are united. Universal Form is identified with the World-Soul, which through its faculty of intellect serves as efficient cause of the world, and through its status as form, animates and informs the world. As a result, it is both a part of the universe (as form) and not a part (as efficient cause). It was this part of Bruno's theory that led to mistaken accusations of pantheism.

His view of matter has two consequences. First, he rejected the Neoplatonic hierarchy in relation to the created world. One can no longer think of matter as at the bottom of the ladder, for it is indivisible from form and indeed from life: 'there is not the least corpuscle that doesn't contain internally some portion that may become alive' ([1584b] 1964: 87). Second, he abandoned the Aristotelian account of individuals as substances belonging to a species. Neither *humanitas* ('humanity') nor *Socrateitas* ('Socrateity') are substantial forms, that is forms which by union with matter constitute a substance capable of receiving accidents. Instead, Socrates is himself an accident of the one material substance, and so what we take to be an individual is a collection of fleeting accidents.

Bruno also believed in atomism (see Atomism), but his account in *De triplici minimo et mensura* seems to retain the dualism of form and matter. Atoms are the smallest parts of things, and are indivisible, but there are different types of atom. Some atoms are the constituents of material things, other atoms are soul, while a third simple element, the monad, is found rationally in numbers and essentially in all things ([1582-1600] 1962 vol. I, part 3: 140). Indeed, Bruno even calls God the monad of monads (*monadum monas*) ([1582-1600] 1962 vol. I, part 3: 146) because he is one in the fullest sense.

6 Influence

At first, Bruno had little influence, partly because his works were placed on the Index in 1603, but also because some of them were in Italian, while Latin remained the language of science and scholarship well into the seventeenth century. Kepler cites him a number of times, and there seem to be hints of his thought in Spinoza and in Leibniz, but it is difficult to tell whether there was any direct influence. He became popular in Germany in the late eighteenth and early nineteenth centuries, when such thinkers as Schelling and Jacobi praised him for his supposed pantheism. In the later nineteenth century he became an Italian national hero, and was regarded as a martyr for freedom of thought and modern science.

Brunschvicg, Léon (1869-1944)

Brunschvicg occupied a central place in French philosophy during the first part of the twentieth century. In 1909 he became a professor at the Sorbonne, teaching there and at the École Normale Supérieure for the next thirty years. His indefatigable activity, wide curiosity and erudition made him a leading figure of French philosophy. His influence is manifest in the work of Bachelard, Piaget, Guéroult, Nabert, Koyré and Sartre. His most important work lay in the field of the philosophy of mathematics, where (among other things) he introduced French philosophers to the work of Frege and Russell.

1 Life

Léon Brunschvicg was born in Paris in 1869, and educated alongside Louis Couturat at the Lycée Condorcet and the École Normale Supérieure. In 1893 he helped to found the *Revue de Métaphysique et de Morale*, which remains one of the most distinguished French journals. In 1897 he received his doctorate for his dissertation, *La modalité du jugement (The Modality of Judgment)*. He wrote here that ‘ the proof of a single theorem is sufficient to give us the joy and security of certainty, since it implies truth’ (1897: 237), which is the starting-point for his philosophy of mathematics. His subsequent teaching career was spent in Paris; but he died at Aix-les-Bains, where he had taken refuge during the war.

2 *Les étapes de la philosophie mathématique* (The Stages in the Philosophy of Mathematics) (1912)

In his most important work, *Les étapes de la philosophie mathématique (The Stages in the Philosophy of Mathematics)* (1912), Brunschvicg sets out the principal stages of philosophical reflection on mathematics. What fundamentally concerns him here is the problem of truth: he writes in the preface (unfortunately omitted from the 1972 edition) that he aims to resolve this problem by ‘ a meditation on the discipline which has employed the greatest scrupulousness and subtlety in its search for the truth’ (1912: xi). Brunschvicg’s concern to elucidate the underlying commitment within mathematics to a conception of truth can be contrasted with the conventionalism of his older contemporary Henri Poincaré who looked primarily to the practical achievements of mathematics (see Conventionalism §1).

Brunschvicg undertakes a massive survey of the evolution of mathematical thought, from the first attempts of primitive peoples to develop a number system to the most advanced results of the modern age. Among the most important discussions are those devoted to classical antiquity (which deal with the number theories of Pythagoras and Plato and with Aristotle’s logic, and that of the work of Descartes (concerning his analytic geometry and his conception of a universal mathematics). Brunschvicg also sets out the philosophical account of mathematics to be found at the start of the modern period in the works of Kant and Comte, who both believed that mathematics was a completed science. This account was overturned during the nineteenth century, however, when profound changes in mathematical techniques were introduced, and new lines for research opened up in all directions. In discussing this, Brunschvicg devotes a long chapter to the development of modern logical theory - to Boole, Peano, Frege and, above all, Russell.

The final chapters are devoted to drawing the moral of this long historical inquiry. Brunschvicg here clarifies his own point of view, and presents a qualified form of ‘intellectualism’ in his final chapter on ‘The reaction against "mathematism": the sense of intellectualism in mathematics’. Up to now, he claims, the philosophy of mathematics has lacked a proper appreciation of the nature of truth in mathematics. In accepting that the logical order of exposition reverses the direction of the psychological order of discovery, philosophers of mathematics admit implicitly that the concern for rigour that is characteristic of reasoning is foreign to, indeed opposed to, the discovery of mathematical truth. Thus their conclusion should be that the logical formalization of mathematics makes no difference to its truth. So even in mathematics one should bear in mind the two distinctive marks of the intellect - ‘an indefinite capacity for progress’ joined with ‘a perpetual disquiet about verification’. As such, mathematics represents one of the most powerful and lasting achievements of the human genius; it reveals to us the capacities of the human intellect, and should be as much a foundation for our knowledge of the mind as it is for the natural sciences. ‘ The activity of the mind has been free and productive only since the epoch when mathematics brought to mankind the true standard of truth’ ([1912] 1972: 577).

3 Other works

Brunschvicg's numerous writings are diverse. One area of interest was the history of philosophy, especially seventeenth-century French philosophy. He produced the standard edition of Pascal's *Pensées et opuscules* (1897); wrote *Spinoza et ses contemporains (Spinoza and His Contemporaries)* (1923); and in 1942 completed *Descartes et Pascal: lecteurs de Montaigne (Descartes and Pascal: Readers of Montaigne)* (1944). In an earlier work on a much grander historical scale, entitled *Le Progrés de la conscience dans la philosophie occidentale (The Progress of Consciousness in Western Philosophy)* (1927), he had opened up wider and bolder lines of thought.

Brunschvicg also wrote on the philosophy of science. He took the view that the development of science was not autonomous: philosophy is not to be separated from science and should not pretend to a superior or distinctive kind of truth. This line of thought, which continues that of *Les étapes de la philosophie mathématique*, is presented in *L'expérience humaine et la causalité physique (Human Experience and Physical Causality)* (1922) and *La physique du vingtième siècle et la philosophie (Philosophy and Twentieth-Century Physics)* (1936). For Brunschvicg, the development of science reveals the work of the human intellect and shows reason at work; as Plato held, the philosopher or the scientist should be able to concern himself with truth in a completely disinterested spirit, following to the limit the movement of commitment which, from Copernicus to Einstein, has manifested the character of the human intellect. In the same spirit, the philosopher and scientist should seek to bring together the pursuit of truth with that of beauty and the good. Grasped in its essence, science should aim to be what it was for Plato, Descartes and Kant: our way of gaining access to the truths of the human spirit.

Bryce, James (1838-1922)

James Bryce, British statesman and writer, combined a distinguished public life with scholarship in history, politics and law. As a jurist his interest lay in historical jurisprudence, but he is best remembered for his comparative politics. He contributed significantly to democratic political theory and to a liberal-historicist approach in philosophy of law.

Bryce was born in Belfast in 1838, of Ulster Scottish descent. He was educated at Glasgow University and Oxford University. Although called to the Bar in 1867, he preferred scholarship, travel and public service. As Regius Professor of Civil Law at Oxford (1870-93), he reinvigorated the study of Roman law in Britain and helped to reform legal education. He entered Parliament as a Liberal MP in 1880 and held several ministerial offices between 1886 and 1906. He was Ambassador to the USA (1907-13), was elevated to the peerage as Viscount Bryce of Dechmont in 1914, and remained active in public life until his death.

Bryce diffused his energies widely and was a prolific writer and scholar as well as a man of affairs. In *The Holy Roman Empire* (1864) he propounded a thesis of historical unity stretching from ancient Rome to nineteenth-century Germany. In other works he portrayed England's legal system as emulating, in the modern world, Roman law in the ancient, and emphasized an Anglo-American affinity. His *The American Commonwealth* (1888) was a monumental treatise designed to supersede Tocqueville's more impressionistic account, and incidentally testified to the success of democracy and of federalism. It was an instant classic. Bryce wrote influentially on the classification and characteristics of constitutions and on comparative politics, for example in *Modern Democracies* (1921). His studies of political systems were determinedly empiricist and his research was invariably supplemented by contacts, conversation and travel: one modern critic suggested that his 'genius largely consisted of an infinite capacity for taking trains'.

Studies in History and Jurisprudence (1901) was perhaps his most representative work. As a typical nineteenth-century liberal, he espoused *laissez-faire* economics, favoured religious and political liberty, distrusted state intervention, but was not free from apprehensions concerning majoritarian democracy. As a historian, he implied biological laws of development, and cannot be acquitted of what Popper was to term historicism (see Popper, K.R. §4). In his philosophy of law, he dismissed natural law theories as a priori and speculative, but faulted aspects of the analytical jurisprudence of Austin and Bentham as being not only historically indefensible but also inapplicable to contemporary societies (see Austin, J.; Bentham, J.). In juristic interests and endeavour he was closer to the comparative method and historical jurisprudence of Maine.

However, he lacked Maine's inclination to theorize. Harold Laski's observation on Bryce's 'insatiable appetite for facts and grotesque inability to weigh them' was unkind but not entirely unfair. In a changing world which he struggled to comprehend, the public servant was garlanded with honours, but the scholar restricted himself to fact-gathering and classification or lofty pronouncements on public affairs.

Buber, Martin (1878-1965)

Martin Buber covered a range of fields in his writings, from Jewish folklore and fiction, to biblical scholarship and translation, to philosophical anthropology and theology. Above all, however, Buber was a philosopher, in the lay-person's sense of the term sense: someone who devoted his intellectual energies to contemplating the meaning of life.

Buber's passionate interest in mysticism was reflected in his early philosophical work. However, he later rejected the view that mystical union is the ultimate goal of relation, and developed a philosophy of relation. In the short but enormously influential work, Ich und Du (I and Thou). Buber argued that the I emerges only through encountering others, and that the very nature of the I depends on the quality of the relationship with the Other. He described two fundamentally different ways of relating to others: the common mode of 'I-It', in which people and things are experienced as objects, or, in Kantian terms, as 'means to an end'; and the 'I-Thou' mode, in which I do not 'experience' the Other, rather, the Other and I enter into a mutually affirming relation, which is simultaneously a relation with another and a relation with God, the 'eternal Thou'.

Buber acknowledged that necessity of I-It, even in the interpersonal sphere, but lamented its predominance in modern life. Through his scholarly work in philosophy, theology and biblical exegesis, as well as his translation of Scripture and adaptations of Hasidic tales, he sought to reawaken our capacity for I-Thou relations.

1 Life

Martin Mordechai Buber was born in Vienna. Following the divorce of his parents when he was three years old, he spent most of his childhood in Lemberg, Galicia, with his grandparents Solomon and Adele Buber. This separation from his parents, particularly his mother, had a profound effect on the subsequent development of Buber's philosophy of relation. His abiding childhood memory was not of his mother leaving him - he expected her to come for him any day - but of being told at the age of four by a baby-sitter that his mother would never return. 'I suspect,' he later wrote, 'that everything I experienced of genuine encounter during the course of my life had its origin in that moment on the balcony' ([1960b] 1972: 18-19).

At the age of fourteen, Buber returned to his father's house, where he lived with his father and step-mother. He rejected the traditional Judaism of his father and grandparents, and became increasingly interested in philosophy, particularly the works of Kant and Nietzsche. In 1896 Buber enrolled as a student of philosophy at the University of Vienna. Two years later he moved to the University of Leipzig and joined the Zionist movement (see Zionism). Buber was still not interested in the religious tradition he had rejected as an adolescent, but he devoted his energies to the renewal of Jewish culture.

As a delegate to the Third Zionist Congress in 1899, Buber spoke on behalf of the Propaganda Committee, but he used the platform to emphasize the importance of education rather than propaganda. In 1901 he was appointed editor of the weekly Zionist publication *Die Welt*, in which he again stressed the need for a Jewish cultural renaissance. Later in the same year he became a member of the Zionist Democratic Fraction which was opposed to the programme of Theodor Herzl and, at the Fifth Zionist Congress, he resigned as editor of *Die Welt*. Shortly after the Congress, Buber withdrew from political affairs. From about 1903 onwards, he immersed himself in the study of Hasidism. Although initially attracted to the literary qualities of the Hasidic tales, he gradually developed an appreciation of their spiritual content and took it upon himself to communicate the message of Hasidism to the assimilated Jews of western Europe, and to humanity at large.

During the years 1906 to 1911, Buber attended lectures at the University of Berlin, especially those given by Wilhelm Dilthey. Dilthey's hermeneutic theory was an important influence on Buber's approach to interpretation, as manifested both in his Hasidic writings and in his later work of biblical translation and commentary (see Hermeneutics). Buber resumed public life in 1909. He exerted a profound influence on Jewish youth in central Europe through his lectures and publications. In 1916 he founded *Der Jude*, a monthly publication which promoted the Jewish cultural renaissance. Buber's Zionism continued to diverge from the mainstream. He sought complete equality and cooperation between Jews and Arabs and believed that Palestine could become the shared homeland of two autonomous peoples. His political philosophy also diverged from the dominant conception of socialism. He

believed that a socialist society could never come about through the mechanism of the state; rather, it depended on a renewal of relationships among individuals.

Buber's reflections on the relations between people developed into his most famous work, *Ich und Du*, which was published in 1923. Although he continued to write for over forty years, *Ich und Du* is unquestionably his masterpiece. 'It is the vessel into which he pours the learning and wisdom acquired over the years' and 'everything that he wrote afterwards can be traced back to it' (Vermes 1994: 27). In 1925, Buber took on a project that would occupy him for decades: a new German translation of the Hebrew Bible. Begun in collaboration with Franz Rosenzweig, the work was continued by Buber on his own after Rosenzweig's premature death in 1929. The final volume of *Die Schrift* was published in 1961. Buber did not actively work on the translation between 1932 and 1949, but he continued to reflect on the Hebrew Bible, publishing works of biblical criticism and theology, including *Königtum Gottes (Kingship of God)* (1932), 'Die Frage an den Einzelnen' ('Question to the Single One') (1936), *Torat ha-Neviim (The Prophetic Faith)* (1940), and *Moshe (Moses)* (1946).

In 1930, Buber was appointed professor of religion at the University of Frankfurt. He retained this position until 1933, when, following the Nazi rise to power, he was forced to leave the university. In the same year he became director of the Central Office for Jewish Education and head of the Jüdisches Lehrhaus in Frankfurt. He travelled throughout Germany, lecturing and teaching, until 1935, when he was prohibited from speaking at Jewish gatherings. Buber moved to Jerusalem in 1938, when he was appointed to the newly created chair of social philosophy at the Hebrew University. He taught there until his retirement in 1951. After retiring Buber continued to write, and he lectured extensively abroad. In his later works he wrestled with the themes of good and evil and the suffering of the innocent, publishing *Bilder von Gut und Böse (Good and Evil)* (1952) and *Gottsfinsternis (Eclipse of God)* (1953).

2 Early writings

Buber's period of intense research into Hasidism resulted in two books of Hasidic legends: *Die Geschichten des Rabbi Nachman (The Tales of Rabbi Nachman)* (1906) and *Die Legende des Baalschem (The Legends of the Baal-Shem)* (1908). Influenced by both Nietzsche and Dilthey, Buber did not simply translate the Hasidic tales, but retold them, attempting to renew the old stories for his generation. Although determined to retain the original spirit of the tales, he believed, following Dilthey's hermeneutics, that his empathy with the Hasidic masters gave him licence to edit and embellish their stories. Buber's interpretation of Hasidism was criticized by scholars, notably Gershom Scholem.

Buber's early enthusiasm for mysticism is also evident in *Daniel: Gespräche von der Verwirklichung (Daniel: Dialogues on Realization)* (1913), the main theme of which is the quest for meaning in human life. Although many of the observations in *Daniel* prefigure the more mature *Ich und Du*, the earlier work specifies a form of mystical union as the ultimate aim of relation. The eponymous Daniel urges his companion to come to know a tree not by observing it, but by identifying with it, to the extent that she feels its bark to be her own skin.

3 *Ich und Du*

In *Ich und Du*, the mystical ideal of union is replaced by a dialogical notion of relation. The relation between a person and a tree is again presented as an example, but this time the aim is not to identify with the tree, but to encounter it, entering into dialogue with it. Dialogue with a tree? Many readers find this notion mysterious, if not mystical. Yet it is essential to note that, according to Buber, dialogical relation is not limited to the interpersonal sphere. The thesis of *Ich und Du* is that there are two fundamental modes of relating to others. Buber names these two fundamental attitudes 'I-Thou' and 'I-It':

> To man the world is twofold, in accordance with his twofold attitude. The attitude of man is twofold, in accordance with the twofold nature of the primary words which he speaks. The primary words are not isolated words, but combined words. The one primary word is the combination *I-Thou*. The other primary word is the combination *I-It*; wherein, without a change in the primary word, one of the words *He* and *She* can replace *It*. Hence the *I* of man is also twofold. For the *I* of the primary word *I-Thou* is a different *I* from that of the primary word *I-It*.

(1923: 3)

Buber explores the dual nature of human existence through the pronouns that a person speaks. He insists that the 'I' does not exist independently of the others it addresses; 'there is no *I* taken in itself, but only the *I* of the primary word *I-Thou* and the *I* of the primary word *I-It*' (1923: 4). The world of It is the world of discrete objects; the corresponding I is the self who experiences something, and this 'something' can as easily be a person as a thing. In a clear departure from his earlier mysticism, Buber also insists that there is no fundamental difference between 'inner' and 'outer' experiences - both belong to the world of It.

The I-Thou, by contrast, is a reciprocal relation in which there is no experience of the Other but, rather, a mutual encounter, in which each party affects and affirms the Other. It can only take place if 'the primary word I-Thou' is spoken 'with the whole being'. The relation to the Thou is direct, not mediated by the I's concepts, preconceptions, or intentions. The encounter is lived as a discovery of the uniqueness and concrete presence of the Other *qua* Other and, in a sense, as revelation, for Buber insists that 'in each *Thou* we address the eternal *Thou*' (1923: 6).

Buber discusses three spheres in which the I-Thou relation is possible: life with nature, life with people, and life with 'spiritual beings' (*geistige Wesenheiten* or, as Wood translates it, 'forms of spirit' (1969: 43)). Buber is not concerned here with mystical beings, but with aesthetic inspiration. He asserts that the true artist does not express himself, but responds to an encounter with a 'form which desires to be made through him into a work' (1923: 9).

Of the three spheres, only that of inter-human relations permits a literal dialogue of I with Thou. However, Buber employs the linguistic metaphor of 'saying Thou' to discuss relations in all three spheres. He notes that when we address creatures as Thou, 'our words cling to the threshold of speech' and that, in addressing forms of spirit as Thou, we speak with our being, not with our lips (1923: 6). Linguistic terms in *Ich und Du*, including 'word', 'language', 'dialogue' and 'speech', are primarily used metaphorically to convey the qualities of presence, dynamism and reciprocity which characterize the I-Thou relation (Kepnes 1992: 31); indeed, according to Kohanski's reading of Buber, 'the very act of turning to another in relation is an act of speaking, even when not a word is uttered between them' (1982: 268).

I-Thou is clearly the privileged mode of existence. For Buber, 'all real living is meeting [the *Thou*]' (1923: 11). But he also recognizes that I-It, the ordinary mode of existence, is indispensable. In *Ich und Du* he does not call for the abandonment of I-It, which would be impossible, but aims rather to re-awaken the reader's potential for true relation.

4 Relationship with Jewish philosophy

Ich und Du is not a work of Jewish philosophy in the sense of 'philosophy of Judaism'; it deals with universal philosophical themes and is intended for a broad audience. Nevertheless, the philosophy expounded in its pages shares many key features with those of other twentieth-century Jewish philosophers, notably Hermann Cohen, Franz Rosenzweig and Emmanuel Levinas. The conception of the 'I-Other' relationship within these Jewish thinkers' writings differs markedly from the dominant view in modern western philosophy - epitomized by Sartre's exclamation 'Hell is the Other!' - that this relationship is fundamentally antagonistic. Buber, Cohen, Rosenzweig and Levinas all reject this view of the I-Other relationship. They see a positive, welcoming response to the Other as the *sine qua non* of authentic selfhood.

According to these thinkers, the 'I' emerges from addressing the 'you' (or 'thou'). For each of them, in different ways, the interpersonal relationship is also the site of transcendence. In Buber's terms, 'in each *Thou* we address the eternal *Thou*'; in Levinas', the Other's face 'is the manifestation of the height in which God is revealed' (1961: 79).

Nevertheless, despite the resemblances between these thinkers, both Rosenzweig and Levinas criticized *Ich und Du*. Levinas took issue with Buber's characterization of the I-Thou. One of his major criticisms was that Buber 'understood the Thou primarily as partner and friend and thus gave primacy to a relationship of reciprocity' (see Bernasconi 1988: 105), in contrast with Levinas's own emphasis on the asymmetry of the 'Je-Vous', or 'face-to-face' relation, through which I become aware of my inescapable responsibility for the Other, without regard to the Other's responsibility for me.

Commenting upon the galley proofs of *Ich und Du*, Rosenzweig wrote to Buber: 'In your setting up the I-It, you

give the I-Thou a cripple for an opponent. True, this cripple rules the modern world: however, this does not change the fact that it is a cripple' (see Horwitz 1988: 227).

5 Theology and hermeneutics

Although Buber did not alter *Ich und Du* in response to Rosenzweig's criticism, Rosenzweig's 'New Thinking' was a major influence on the development of Buber's subsequent work, particularly in the areas of hermeneutics and theology. Steven Kepnes (1992) has traced the development of Buber's hermeneutics and theology from his early pantheistic, romantic period, through the dialogical thought of *Ich und Du*, to Buber's later version of narrative theology, which both transcends and incorporates the insights of *Ich und Du*. Buber's later work on the Bible continued to emphasize moments of encounter, both with God and between human beings, but his equally strong interest in the Bible as a source for the common memory of the Jewish people reveals the influence of Rosenzweig's notions of creation, revelation and redemption. In Buber's later thought, a Jew reads the Bible not simply to facilitate an I-Thou encounter with the text, but to discover in the biblical narratives resources for addressing the reader's own situation.

From the early 1940s, Buber's reflections on the Bible centred, unsurprisingly, on the theme of innocent suffering. He drew upon Job, Deutero-Isaiah and the Psalms in his attempt to express the suffering and fragile hope of his generation, describing the Holocaust era as a time of the 'eclipse of God'. Buber attempted no theodicy. He sought rather to express the Job-like faith of those who await the end of the eclipse:

> Do we stand overcome before the hidden face of God like the tragic hero of the Greeks before faceless fate? No, rather even now we contend… with God …. In such a state we await His voice, whether it comes out of the storm or out of a stillness that follows it. Though his coming appearance resemble no earlier one, we shall recognize again our cruel and merciful Lord.

List of works

Buber, M. (1962-4) *Werke*, vol. 1, Munich and Heidelberg: Kosel-Verlag and Verlag Lambert Schneider. (Contains all of Buber's major philosophical works.)

Buber, M. (1906) *Die Geschichten des Rabbi Nachman; Ihm nacherzählt von Martin Buber*, Frankfurt: Rütten und Loening; trans. M. Friedman, *The Tales of Rabbi Nachman*, Atlantic Highlands, NJ: Humanities Press International, 1988.(The first fruit of a five-year period of research into Hasidism, this book is not a simple anthology of tales and legends which Rabbi Nachman of Bratslav taught to his disciples, but Buber's own retelling of the stories. It opens with 'Jewish Mysticism', an essay on Hasidism.)

Buber, M. (1908) *Die Legende des Baalschem*, Frankfurt: Rütten und Loening; trans. M. Friedman, *The Legends of the Baal-Shem*, New York: Schocken, 1969.(This work established Buber's reputation as a first-class German writer. It is a free retelling of the legendary life of Rabbi Israel ben Eliezer (1700-60), the founder of the Hasidic movement, with an introductory essay on 'The Life of the Hasidim', in which Buber outlines his interpretation of Hasidic thought.)

Buber, M. (1913) *Daniel: Gespräche von der Verwirklichung*, Leipzig: Insel-Verlag; trans. M. Friedman, *Daniel: Dialogues on Realization*, New York: Holt, 1964.(This collection of five dialogues on the themes of direction, reality, meaning, polarity and unity is Buber's first work of general philosophy. Since Buber later rejected some of its teachings, the work is primarily of importance for readers interested in the development of his thought.)

Buber, M. (1923) *Ich und Du*, Leipzig: Insel Verlag; trans. R.G. Smith, *I and Thou*, New York: Charles Scribner's Sons, 2nd edn, 1958; trans. W. Kaufman, *I and Thou*, New York: Charles Scribner's Sons, 1970. (The page numbers used in references to the work in this entry are those from the Smith translation; Kaufman's translation substitutes 'you' for 'thou' everywhere except the title. *Ich und Du* is Buber's most famous and influential work, in which he describes two modes of relating to others: 'I-Thou' and 'I-It'. The first is a reciprocal, mutually affirming encounter between self and Other; it is the route to authentic selfhood. The second designates the commonplace attitude of using or experiencing an object. While recognizing that the I-It mode of relation is indispensable, even in the realm of interpersonal relations, Buber argues that a renewal of

society can take place only through a reawakening of our potential for I-Thou encounters.)

Buber, M. (1932) *Königtum Gottes*, Berlin: Schocken; trans. R. Scheimann, *The Kingship of God*, Atlantic Highlands, NJ: Humanities Press International, 1988.(The first of Buber's purely scholarly studies of the Hebrew Bible, which are mainly concerned with the theme of messianism. Buber interprets the covenant between God and Israel as the means by which the kingship of God is to be actualized in communal life.)

Buber, M. (1936) 'Die Frage an den Einzelnen', trans. R.G. Smith, 'The Question to the Single One', in M. Friedman (ed.) *Between Man and Man*, New York: Macmillan, 1965.(Here, Buber responds sensitively yet critically to Kierkegaard's attempt to prepare himself for a true relation with God by renouncing both marriage and the body politic. Buber himself rejects the path of renunciation, and holds that 'the man who loves God and his companion in one… receives God for his companion'.)

Buber, M. (1942) *Torat ha-Neviim*, Tel Aviv: Bialik; trans. C. Witten-Davis, *The Prophetic Faith*, New York: Harper & Row, 1960.(Considered by many scholars to be Buber's finest work of biblical exegesis, this study examines the role of God's 'servants' - Job, Abraham, Moses, David and Isaiah - as partners in the revelation of the God of history. Buber rejects traditional interpretations which identify the suffering servant of Deutero-Isaiah with either corporate Israel or Christ. Instead, he sees the servant as a perfected human being whose task is to bring Israel back to the service of God, thus heralding the beginning of God's kingdom on earth.)

Buber, M. (1946) *Moshe,* Jerusalem: Schocken; trans. *Moses: The Revelation and the Covenant*, New York: Harper & Row, 1958; repr. Atlantic Highlands, NJ: Humanities Press International, 1988.(In this work Buber continues the exposition of Hebrew messianism begun in *Königtum Gottes*, and develops his approach to the Bible as a historical account of a particular people's response to moments of I-Thou encounter with God.)

Buber, M. (1946, 1947) *Or ha-Ganuz - Sippurey Hasidim*, Jerusalem and Tel Aviv: Schocken, 2 vols; trans. O. Marx, *Tales of the Hasidim: The Early Masters and Tales of the Hasidim: The Later Masters*, New York: Schocken, 1995.(These two collections of legendary anecdotes about the great Hasidic masters are of importance for tracing the development of Buber's hermeneutics. In the introduction to the first volume, Buber criticizes his earlier collections of Hasidic legends for being too free. The anecdotes in these two volumes are related without embellishment or imaginative additions.)

Buber, M. (1947) *Netivot be-Utopia*, Tel Aviv: Am Oved; German translation, *Pfade in Utopia*, Heidelberg: L. Schneider, 1950; English trans. R.F.C. Hull, *Paths in Utopia*, New York: Macmillan, 1988.(An important contribution to both social philosophy and the history of socialism, this work includes chapters on Proudhon, Marx, Lenin and other utopian thinkers. Buber also discusses a variety of experiments in collective living, including the Israeli *kibbutz*, which he describes as 'an experiment that did not fail'.)

Buber, M. (1950) *Zwei Glaubenweisen*, Zurich: Manesse; trans. N. Goldhawk, *Two Types of Faith*, New York: Macmillan, 1986.(In this controversial study of Jesus and Paul, Buber presents Jesus' conception of faith as *emunah*, a Hebrew term which, Buber notes, implies both 'fidelity' and 'trust'. For Paul, by contrast, faith is cognitive and entails belief in a proposition.)

Buber, M. (1951) 'Distance and Relation', *Hibbert Journal* 49; trans. R.G. Smith, in M. Friedman (ed.) *The Knowledge of Man: A Philosophy of the Interhuman*, Atlantic Highlands, NJ: Humanities Press International, 1988.(This essay is the most important exposition of Buber's mature social anthropology. Buber analyses the movements of 'setting at a distance' and 'entering into relation' which underlie both the 'I-It' and 'I-Thou' relations.)

Buber, M. (1952a) *Bilder von Gut und Böse*, Cologne: Hegner; trans. R.G. Smith, *Good and Evil*, New York: Charles Scribner's Sons, 1952.(Buber develops an anthropological analysis of evil based on both biblical texts and Zoroastrian myths.)

Buber, M. (1952b) *An Der Wende*, Cologne: Hegner; English translation ed. N. Glatzer, *On Judaism*, New York: Schocken, 1972.(A collection of Buber's speeches on Jewish themes, delivered in Germany and central Europe from 1909 to 1918, and the four lectures he gave in America in 1951-2. It includes 'Der Dialog zwischen Himmel und Erde', translated in the Glatzer edition by E. Jospe as 'The Dialogue Between Heaven and Earth', which is of particular importance for readers interested in Buber's response to the Holocaust.)

Buber, M. (1953) *Gottsfinsternis*, trans. M. Friedman, E. Kamenka, N. Guterman and I.M. Lask, *Eclipse of God: Studies in the Relation Between Religion and Philosophy*, New York: Harper & Row; repr. with introduction by R. Seltzer, Atlantic Highlands, NJ: Humanities Press International, 1988.(In this collection of nine essays on religion and philosophy, Buber criticizes contemporary thinkers, including Nietzsche, Bergson, Heidegger, Sartre and Jung, who have denied transcendence and thus contributed to the 'eclipse of God'.)

Buber, M. (1954) 'Elemente des Zwischenmenschlichen', in *Die Schriften über das dialogische Prinzip*, Heidelberg: L. Schneider; trans. R.G. Smith, 'Elements of the Interhuman', in M. Friedman (ed.) *The*

Knowledge of Man: A Philosophy of the Interhuman, Atlantic Highlands, NJ: Humanities Press International, 1988.(Buber argues for distinguishing between the realm of the 'interhuman' and that of the 'social'. The former refers to the sphere of direct dialogical relation, the latter describes impersonal group relations.)

Buber, M. (1955) 'Der Mensch und sein Gebild', Heidelberg: Lambert Schneider; trans. M. Friedman, 'Man and His Image-Work', in M. Friedman (ed.) *The Knowledge of Man: A Philosophy of the Interhuman*, Atlantic Highlands, NJ: Humanities Press International, 1988.(An important statement of Buber's aesthetics, based on his epistemological theory that 'I-It' knowledge is derived from the 'I-Thou' relation.)

Buber, M. (1956) 'Dem Gemeinschaftlichen folgen', *Die Neue Rundschau* 67 (4): 582-600; trans. M. Friedman, 'What is Common to All', in M. Friedman (ed.) *The Knowledge of Man: A Philosophy of the Interhuman*, Atlantic Highlands, NJ: Humanities Press International, 1988.(Buber draws upon Heraclitus to analyse the emergence of a common world, and thus a 'We', through meaningful human speech.)

Buber, M. (1957) 'Guilt and Guilt Feelings', *Psychiatry* 20 (2); trans. M. Friedman, in M. Friedman (ed.) *The Knowledge of Man: A Philosophy of the Interhuman*, Atlantic Highlands, NJ: Humanities Press International, 1988.(Contra Freud and other thinkers, Buber argues that guilt is not always reducible to neurosis or social convention. The possiblity of real guilt is implicit in a philosophy of personal responsibility.)

Buber, M. (1960a) 'Das Wort, das gesprochen wird', in R. Oldenbourg (ed.) *Wort und Wirklichkeit*, Munich: Bayerische Akademie der Schönen Künste; trans. M. Friedman, 'The Word that is Spoken in Word and Reality', in M. Friedman (ed.) *The Knowledge of Man: A Philosophy of the Interhuman*, Atlantic Highlands, NJ: Humanities Press International, 1988.(Buber analyses the importance of lived speech for human existence, arguing that it is ambiguity that constitutes the tension and fruitfulness of living language.)

Buber, M. (1960b) *Begegnung: Autobiographische Fragmente*, Stuttgart: W. Kohlhammer; trans. and ed. M. Friedman, *Meetings*, La Salle, IL: Open Court, 1972.(A collection of twenty autobiographical anecdotes, some of which appear in Buber's earlier work, which Buber assembled in place of a conventional autobiography for *The Philosophy of Martin Buber*. Each fragment relates an event, meeting or 'mismeeting' which had an important influence on the development of his thought.)

Buber, M. and Rogers, C.R. (1960) 'Dialogue between Martin Buber and Carl R. Rogers', *Psychologia - An International Journal of Psychology in the Orient* 3 (4); repr. in M. Friedman (ed.) *The Knowledge of Man: A Philosophy of the Interhuman*, Atlantic Highlands, NJ: Humanities Press International, 1988.(Transcript of a 1957 discussion between Buber and the American psychologist Carl Rogers. The dialogue brings out differences between their approaches to psychology, and elaborates the significance of Buber's thought for psychotherapy.)

Buber, M. (1965) *Between Man and Man*, ed. M. Friedman, New York: Macmillan. (Collection of essays including 'Die Frage an den Einzelnen', 'Dialogue', 'Education', 'Education and Character' and 'What is Man?'.)

Buber, M. (1967) *The Philosophy of Martin Buber*, trans. M. Friedman *et al.*, ed. M. Friedman and P.A. Schilpp, Library of Living Philosophers, Cambridge: Cambridge University Press.(Includes Buber's 'Autobiographical Fragments' and 'Replies to Critics', as well as essays on Buber's thought by Gabriel Marcel, Emmanuel Levinas, Emil Fackenheim and Ernst Simon, among others.)

Buddha (6th-5th century BC)

The title of Buddha is usually given to the historical founder of the Buddhist religion, Siddhārtha Gautama, although it has been applied to other historical figures, Buddhist and non-Buddhist, and to many who may be mythological. The religion which he founded was enormously successful and for a long period was probably the most widespread world religion. It is sometimes argued that it is not so much a religion as a kind of philosophy. Indeed, Buddhism bears close comparison with some of the philosophical schools of the Hellenistic world in this respect. The Buddha himself does not seem to have known the concept of a transcendent God and most schools of Buddhism have repudiated it on the grounds, among others, that it undermines personal responsibility for action. Buddhism could be considered as a kind of 'metareligion', open to many religious practices and tolerating others, but not identifiable with religious activity as such - more a kind of philosophical structuring of religion together with a methodology for self-development. Associated with this latter is an elaborate and sophisticated account of mental states and the functioning of consciousness. Characteristic of earlier Buddhist thought is a positive emphasis upon balanced states and a strong rejection of any form of underlying substance and most types of changelessness.

The date when the Buddha, or Siddhārtha Gautama, lived is not certain. For some time most scholars thought that the main period of his activity was in the late sixth century BC, but many believe it more likely that he died close to the end of the fifth century BC, making him a near contemporary of Socrates. Varied information about his life has been preserved, although it is difficult to differentiate between accurate biography and later legend. Scholars are divided on this issue.

It is known that he was born in a noble family among a people called the Sākyas who dwelt near the present-day borders of India and Nepal. After marriage and the birth of a son he experienced some kind of existential crisis. Extant literature presents him as perceptive to the sickness, old age and mortality inherent in life and perceiving the possibility of a solution to such problems. So he went forth ultimately 'for the welfare and benefit of the manyfolk' (as many early Buddhist texts put it) and took up the wandering lifestyle of a homeless religious mendicant. He studied under various spiritual teachers and then, seeking to go beyond what he had learned from them, he adopted, together with a group of companions, the common Indian practice of severe asceticism for around six years. He rejected this method as ineffectual and returned to more moderate practices at which point he achieved the spiritual breakthrough that made him a *buddha*. The remainder of his life was spent teaching the way he had found, or rather rediscovered, to his disciples.

This way is often characterized as the 'Middle Way' between the extremes of pursuing sensual pleasures and suffering torment as a means of self-purification and applies both to spiritual praxis and intellectual understanding. The Middle Way also seeks to avoid the extremes of 'eternalism' and 'annihilationalism'. These are terms for commitment as a result of a psychological bias - either towards the belief that there is an unchanging immortal soul that survives death or that death is the final end and there is no continuity after the destruction of the body. Similarly any suggestion that the soul or life principle (*jīva*) is identical to, or completely distinct from the body is avoided. Preferences with regard to the universe were also considered to be the result of psychological bias, for example, whether or not it is eternal in time, and whether it is finite or infinite in space.

With regard to practice, the Buddha especially advocated the development of the meditation states known as *jhānas* (*dhyāna*). Since these were characterized by a pleasant state of mind, they contrasted with the painful methods of practice widespread in the Indian religion of the day. These states also placed a stress on clarity and conscious awareness, as distinct from the apparent valuation of unconscious trance-like states in pre-Buddhist Indian religion. This emphasis led to the development of methods of study and practice which strongly asserted the importance of insight and understanding (*prajñā*). For most later forms of Buddhism and probably for the Buddha himself, the actual goal of Buddhist meditation represented an awakening which permanently integrated both the meditative states of the *jhānas* and a high development of understanding. It is this which is referred to in the early texts as acquiring the 'vision of truth' or '*dhamma* eye' and is seen as the basis for the awakening or *bodhi*, taught by the Buddha, or Awakened One.

According to early Buddhists, the Buddha presented his teaching on two levels. At an introductory stage he put

forward a simple model of the good life, advocating both the practice of generosity and moral restraint. This was probably linked to a picture of the world as one where living beings were reborn in a series of after-death destinies, including rebirth as a human being or animal (see Karma and rebirth, Indian conceptions of). Such a view appears to have been already widely known, even by the Greeks of that time. Living such a life was seen as creating conditions for a better mental state, capable of understanding more profound truths. For the Buddha these more advanced truths were his higher teaching and were referred to as the Four Noble Truths.

The Buddha probably rejected monism. Early on his followers developed a type of process philosophy which emphasized the universality of change in ordinary experience and rejected the idea that there was any kind of fixed essence behind things. This applied both to the world at large and to the individual. Thus, notions of a world-soul, or ground of being and a permanent, unchanging individual nature were repudiated. The picture they adopted saw life in terms of harmonious interaction of multiple processes. Fundamental to this was the notion of *dhamma* (Sanskrit *dharma*) - the lawful and harmonious nature of things. This *dhamma* was rediscovered by the Buddha and his teaching was understood as the presentation of a universal law which exists in some sense, whether or not it is known about.

Our knowledge of the Buddha's teachings and of early Buddhism in general derives primarily from the collection of texts known as the *tipiṭaka*, or 'three baskets': the canonical writings of early Buddhism. The earliest extant version of these is that preserved in the Pāli language by the southern Buddhists. At first it was preserved within the oral tradition, but was written down in Sri Lanka, formerly Ceylon in the first century BC. Translations of similar texts of diverse origins and dates are preserved in the Chinese Buddhist Canon. Undoubtedly some of this material is as old as the corresponding (and often similar) sources in the Pāli Canon, but it is mixed with material of later origin. Some texts in Sanskrit were discovered in libraries (mostly in Nepal) in the nineteenth century and more recently in the monastic libraries of Tibet, in a ruined library at Gilgit in Kashmir and (often fragmentary) in various desert locations in central Asia. However, most of these appear to be slightly later than the equivalent texts in Pāli. Most recent of all is the acquisition by the British Museum in 1995 of a number of fragments of a version of the Canon in the Gāndhārīlanguage, apparently dating from the first century AD or earlier.

Buddhism, Ābhidharmika schools of

During the first centuries after the Buddha, with the development of a settled life of scholarly study and religious practice, distinct schools began to emerge within the Buddhist community. In their efforts to organize and understand the Buddha's traditional teachings, these schools developed a new genre of text, called 'Abhidharma', to express their doctrinal interpretations. More importantly, the term 'Abhidharma' was also used to refer to the discriminating insight that was not only requisite for the elucidation of doctrine but also indispensable for religious practice: only insight allows one to isolate and remove the causes of suffering.

Abhidharma analysis is innovative in both form and content. While earlier Buddhist discourses were colloquial, using simile and anecdotes, Abhidharma texts were in a highly regimented style, using technical language, intricate definitions and complex classifications. The Abhidharma genre also promoted a method of textual exegesis combining scriptural citation and reasoned arguments.

In content, the hallmark of Abhidharma is its exhaustive classification of all factors that were thought to constitute experience. Different schools proposed different classifications; for example, one school proposed a system of seventy-five distinct factors classified into five groups, including material form, the mind, mental factors, factors dissociated from material form and mind, and unconditioned factors. These differences led to heated doctrinal debates, the most serious of which concerned the manner of existence of the individual factors and the modes of their conditioning interaction. For example, do the factors actually exist as real entities or do they exist merely as provisional designations? Is conditioning interaction always successive or can cause and effect be simultaneous in the same moment? Other major topics of debate included differing models for mental processes, especially perception.

1 Abhidharma

By about the first century BC, about 200 to 300 years after the death of the Buddha, the community of his followers had changed significantly. From a loose grouping of itinerant mendicants, practising largely as individuals, there emerged communities with a settled life of scholarly study and religious discipline. In this more organized setting, Buddhist monks began to re-examine the received teaching, to extend it to new areas, and to elaborate and refine techniques designed to ensure its preservation. Eventually, this new scholastic enterprise became not only the medium for transmitting and understanding the traditional teaching but also tradition in its own right and, for the various schools that were soon to emerge, the source of multiple, even rival traditions.

The Buddhist community developed into separate schools for many reasons: geographic dispersion and isolation; selective patronage; contact with non-Buddhists; disagreements over disciplinary codes; the absence of a single institutional authority; the divergent views of influential teachers; specialization in segments of Buddhist scripture; and, finally, doctrinal disagreements. Among these, disputes about doctrine, or rather the elaboration and analysis of doctrine in the context of disputation with rivals, became a defining activity of the emergent schools. This analysis was called 'Abhidharma'. Although its original meaning is not certain, most interpretations agree that it refers to its purpose of supplementing (*abhi*-) or clarifying the teaching (*dharma*). Abhidharma is not only a genre of texts but also, more importantly, the analytic method and the insight through which one correctly comprehends the Buddhist teaching. For Abhidharma is not an end in itself; the scholastic enterprise, like the original teaching, serves a soteriological goal. Abhidharma enables the practitioner to discriminate those aspects of experience that are defiling and so lead to suffering from those that are virtuous; through this discriminating insight, one can remove the defilements, cultivate virtue, and thereby emulate the Buddha and attain enlightenment (see Suffering, Buddhist views of origination of).

According to the self-understanding of the later Buddhist schools, the Abhidharma simply organizes and explicates the often implicit and embryonic teaching preserved in the collections of discourses on doctrine (sūtra) that are attributed to the Buddha. But while the tradition did not consider Abhidharma as innovative - indeed, most schools attributed the content, if not the very words, of the Abhidharma to the Buddha himself - it is none the less clear that the Abhidharma treatises record doctrinal debate that stimulated new doctrines and new methods of exegesis.

Though evidence suggests that each of the early Buddhist schools preserved and transmitted its own complete set

of texts, which would have included an Abhidharma collection, only two are extant: that of the Theravāda school, which became predominant in Sri Lanka and spread to southeast Asia; and that of the Sarvāstivāda school, which became predominant in north, especially northwest, India and spread to central Asia. Although at opposite ends of the geographical and doctrinal range of schools, these two have Abhidharma collections that are similar in number (seven base texts with commentaries, despite no direct correspondence between the texts of the two collections) and, more significantly, in style and doctrinal subjects. Also, each collection fortunately has a text (the *Kathāvatthu* and its commentary among the Theravādin texts, and the *Mahāvibhāṣā* among the Sarvāstivādin) that, by extensively citing the views of other schools lacking extant Abhidharma works, completes our picture of early Buddhist sectarian views.

2 Philosophical significance: methods of exegesis and argument

With the Abhidharma emphasis on discriminating analysis as the proper mode of religious praxis, Buddhist thought becomes ‘philosophical’. However, the philosophical contribution of Abhidharma cannot be understood apart from its specific sectarian and doctrinal context. Only later, with the appearance of Buddhist logicians (see Dignāga; Dharmakīrti), do familiar, abstract philosophical problems become central, and pragmatic soteriological concerns recede somewhat into the background.

In structure and style of presentation, even more than in subject matter, Abhidharma is radically innovative. The colloquial, earlier discourses that persuaded with simile, metaphor and anecdote are replaced by a precise, regimented style and technical terminology that demonstrates by definition, exegesis, catechesis and taxonomy. Despite its technical character, Abhidharma was not a sterile tangent in the development of Buddhist thought, but was the representative core of the Buddhist monastic worldview.

As is to be expected in a strongly traditional culture, the innovative character of Abhidharma did not spring up in an abrupt or discontinuous way; instead, it grew over centuries, with roots in two tendencies that can be traced to the earlier Buddhist discourses. The first of these tendencies was a penchant for analysis pursued with the goal of encompassing in an intricate classificatory system all the factors (*dharma*) thought to constitute experience. This included topical lists of factors distinguished by numeric and qualitative criteria as well as complex combinations of sets of categories yielding matrices (*mātṛkā*). In this exhaustive listing, all factors of experience would be strictly defined and their relation to all other factors would be clearly indicated by their placement within the various categories; guided by this exhaustive enumeration, the religious practitioner could then distinguish those factors to be cultivated from those to be removed. The second tendency was more expository than analytic and evolved from dialogues about doctrine conducted in the early Buddhist community. Such discussions would often begin with a quotation from earlier discourses or a doctrinal point to be defined and would then proceed using a pedagogical technique of question and answer.

Abhidharma texts also document the concurrent development of organized methods of exegesis and argument. While similar due to shared beginnings, the canons of Buddhist schools became widely divergent; contradictions occur even within the texts of a single school. In order to judge the authenticity and authority of different passages and texts, to interpret them accurately and to mediate conflicting positions, the schools began to elaborate a systematic hermeneutics. In general, the interpretative principles applied were inclusive and harmonizing: any statement deemed in conformity with the teaching of the Buddha or with his enlightenment experience was accepted as genuine; hierarchies were created that incorporated divergent passages by valuing them differently; contradictory passages in the discourses or within Abhidharma texts were said to represent the variant perspectives from which the Buddhist teaching could be presented. Notable for its parallel with later Buddhist ontology and epistemology was the hermeneutic technique whereby certain passages or texts were judged to express absolute truth or reality explicitly, while others, apparently expressing mere conventional truth, nevertheless were judged to have implicit meaning. For the Ābhidharmika schools, accordingly, the Abhidharma texts were considered explicit, whereas the collections of discourses were merely implicit and thus in need of further interpretation.

More formal methods of argumentation begin to appear in Abhidharma texts of the middle period (first centuries AD), which record doctrinal disagreements and debates among rival schools. These texts exhibit a stylized pattern using both supporting scriptural references and reasoned investigations, both of which were considered equally effective in argument. In the earliest examples of such arguments, the reasoned investigations did not yet possess the power of independent proof and were considered valid only in conjunction with supportive scriptural citations.

However, in texts of the later period, supporting scriptural references became decontextualized commonplaces - cited simply to validate the occurrence of terms - and reasoned investigations began to be appraised by independent nonscriptural criteria such as internal consistency and the absence of fallacious causal justification and other logical faults.

3 Philosophical significance: nature of reality and conditioning relations

The exhaustive Abhidharma analysis of experience occasioned doctrinal controversies that could be termed ontological: namely, the manner of existence of the different factors constituting experience; the nature of the reality that they represent; and the dynamics of their interaction, or conditioning. Simple enumerations of factors representing various analytical perspectives are found even in the earlier discourses. Abhidharma texts preserve these earlier analyses, but elaborate more comprehensive and complex intersecting classifications that attempt to clarify the unique identity of each factor as well as all possible modes of interaction among factors. Virtually every early Buddhist school proposed some method of classification, but the lists of specific factors varied greatly. For example, the Sarvāstivādins enumerated seventy-five factors (*dharma*) categorized in five groups: material form (eleven); mind (one); mental factors (forty-six); factors dissociated from material form and mind (fourteen); and unconditioned factors (three). The forty-six mental factors were then subcategorized into groups reflecting their moral quality, a determination essential for correct practice.

The variant lists proposed by other schools often reflect differences of opinion on major issues. Implicit in the Sarvāstivādin categorization of factors is a model of mental processes whereby each moment is characterized by the occurrence of a single instance of mind (*citta*), which serves as a focal point necessarily arising together with ten mental factors that perform specific psychological functions: for example, such factors as feelings, volition, concepts, insight and mindfulness. In addition to these omnipresent and necessary mental factors, mind may also arise with other factors of either a virtuous or unvirtuous moral quality. Other schools, among them the Dārṣṭ āntikas, rejected this model and claimed that more than one mental activity could not occur simultaneously in the same moment, but rather could arise only sequentially in successive moments. Indeed, some sources suggest that certain Dārṣṭāntika masters recognized the existence of only three such mental factors - feelings, concepts and volition - which were thought to arise in successive moments.

Perhaps the most significant controversy debated in the context of these lists concerns modes of existence, specifically, the manner of existence of the individual factors and their conditioning interaction. Within the earlier discourses, the enumerating of factors was motivated not simply by a need to organize the teaching to meet the demands of oral transmission, but rather had a doctrinal function. The fundamental Buddhist teaching of nonself (see Buddhist philosophy, Indian §1) was thought to be validated by demonstrating that no perduring, unchanging, independent ‘self’ (*ātman*) could be found in an entity as a whole, in any of the constituents that the entity comprises, or outside the entity. All entities were thus proven to be impermanent, that is, arising and passing away without any constant essence. In Abhidharma treatises, the increasingly detailed enumerations of factors were intended to demonstrate this fundamental truth of existence as essenceless and impermanent; nevertheless, they led to markedly different ontological models.

A distinctive ontology was constructed by the Sarvāstivādins (‘those who profess that everything exists’), who offered a radical interpretation of impermanence as momentariness, where all factors constituting experience exist separately, arising and passing away within the span of a single moment. In a reality that is an array of radically momentary factors, continuity as commonly experienced and indeed any interaction among the discrete factors would seem to be a logical impossibility. A factor arising in one moment could not act as a condition for an as yet nonexistent future factor, and that subsequent factor could not be said to be conditioned by a past and nonexistent factor of the previous moment. To safeguard ordinary experience, the Sarvāstivādins suggested a novel reinterpretation of existence: each factor, they claimed, is characterized by both an intrinsic nature, which exists unchanged in the past, present and future, and an activity, which, arising and passing away due to the influence of conditions, exists only in the present moment. Only factors that are thus both defined by intrinsic nature and characterized by activity can be considered to exist as real entities; composite objects, consisting of factors and constituting ordinary experience, exist only provisionally. The Sarvāstivādins saw this as the only model that would preserve the Buddhist doctrine of impermanence, since each factor’s activity is conditioned. Conditioning interaction in the past, present and future would still be possible given an existing intrinsic nature. Later

Sarvāstivādins, in an effort to clarify this causal functioning and maintain temporal distinctions, claimed that a factor's present functioning should be distinguished from its functioning in the past or future. Present functioning, or 'activity', refers to homogeneous causation through which a factor conditions the arising of a similar factor in the subsequent moment. Past and future functioning, or 'capability', would include various causal functions, such as serving as an object of cognition in the case of memory, or acting as an immediately prior cause in the arising of a subsequent effect.

The Sarvāstivādin ontological model became the subject of heated debate and was rejected by other Ābhidharmika schools such as the Dārṣṭāntikas, who claimed that factors exist only in the present and not in the past and future. Factors do not exist as isolated units of intrinsic nature that manifest a particular activity through the influence of other isolated conditions. Instead, their activity is to be equated with their very existence. The process of causal activity, the Dārṣṭāntikas argued, is experience itself; the fragmentation of this process into discrete factors possessed of individual existence and unique efficacy is nothing but a mental fabrication.

These ontological investigations generated complex theories of conditioning and intricate typologies of causes and conditions. There is evidence of several rival classifications: the Theravādins proposed a set of twenty-four conditions; the Sarvāstivādins, separate sets either of four conditions or of six causes; and the school represented by the **Śāriputrābhidharmaśāstra*, ten conditions. Each of these individual causes and conditions accounts for a specific mode of conditioning interaction: for example, one cause explains the association among mental factors; another, the maturation of efficacious action; still another, the reciprocal influence of simultaneous factors; and yet another, the arising of a similar subsequent factor. Besides establishing different typologies of causes and conditions, the schools also disagreed on the causal modality exercised by these specific types. The Sarvāstivādins acknowledged that certain of these causes and conditions arise prior to their effects, while others, which exert a supportive conditioning efficacy, arise simultaneously with them. The Dārṣṭāntikas, however, allowed only successive causation; a cause must always precede its effect. In these debates about causality, the nature of animate or personal causation - that is, efficacious action, or *karman* - and the theory of dependent origination intended to account for its activity were, naturally, central issues because of their fundamental role in all Buddhist teaching (see Causation, Indian theories of §§1, 6).

4 Philosophical significance: perception and insight

Abhidharma investigations also extended into the field of epistemology, not for its own sake, but rather for an understanding of how the liberating insight that annuls ignorance and the suffering it causes can arise. To this end, Abhidharma texts carried out a thorough analysis of mental processes, which were all interpreted as varieties of perception. In general, every instance of consciousness, which includes five externally directed varieties of consciousness, and mental consciousness as a sixth, was understood as intentional, occurring only in dependence upon three conditions: a sense organ; a suitable sense object; and the previous moment of consciousness. However, schools disagreed about the specific roles of the sense object, sense organ and consciousness, and about the distinctive character of mental consciousness.

For the Sarvāstivādins, the sense organ grasps the object and consciousness apprehends the general character of the object as grasped by the sense organ: that is, its character as visual form, sound, odour, and so on. The various mental factors simultaneous with that moment of consciousness grasp the particular characteristics of the object. When apprehended in the present moment by consciousness and its associated mental factors, the object becomes internalized as an 'object-support'. In this model of consciousness, erroneous cognition is possible, but such cognition is grounded in an existent object, despite being erroneously grasped by the sense organ or erroneously apprehended by consciousness. Error thus lies in the internal object-support, not in the external object.

In the case of the five externally directed sense organs, the object exists as a real entity and is apprehended only when it is present; indeed, its function as an object verifies its existence as a real entity. The object and sense organ condition the arising of a simultaneous apprehending consciousness. Thus, perception assumes a model of simultaneous conditioning. Mental consciousness also functions according to the model of external perception. The previous moment of consciousness, whatever the type, serves as the mental sense organ for the arising of the subsequent moment of mental consciousness. Any object, whether past, present or future, can be apprehended by mental consciousness. This includes really existent objects - for example, mental factors such as feelings and concepts or any object of the other five varieties of consciousness - or the composite entities of ordinary

experience, which exist only provisionally. Both the organ and object then condition the arising of a present moment of mental consciousness.

The Dārṣṭāntikas consider this Sarvāstivādin model a mere provisional description of perception; no experience, they maintain, including perception, can be analysed into components that actually exist as discrete factors possessing individual activities. The sense organ, sense object, and consciousness are simply provisionally discriminated in the midst of an experienced causal stream. Further, they claim that one cannot establish a relationship of cause and effect within the same moment; as a result, one cannot look to an object in one moment producing consciousness in that very moment. If that were the case, perception would become a successive causal process whereby the sense organ and object in one moment condition the arising of consciousness in a subsequent moment; in effect, perception would always involve apprehension of a past and - for the Dārṣṭāntikas, who reject the existence of past factors - nonexistent object.

Building upon the Abhidharma texts, later Buddhist thought would continue to refine both its dialectical method and its examination of core philosophical issues in the context of debates largely conducted with a variety of extra-Buddhist traditions. But with the passing of the Ābhidharmika schools and the historical conditions that stimulated their particular intersectarian mode of disputation, with its interweaving of hermeneutical and logical argument, there passed also a unique creative phase in the history of Indian thought. Only some of their unique legacy of subtle analyses remains, never fully subsumed into the later tradition and relatively unstudied to this day.

Buddhism, Mādhyamika: India and Tibet

Madhyamaka (‘the Middle Doctrine’) Buddhism was one of two Mahāyāna Buddhist schools, the other being Yogācāra, that developed in India between the first and fourth centuries AD*. The Mādhyamikas derived the name of their school from the Middle Path* (madhyamapratipad*) doctrine expounded by the historical Siddhārtha, prince of the Śākya clan, when he gained the status of a* buddha*, enlightenment. The Madhyamaka, developed by the second-century philosopher Nāgārjuna on the basis of a class of* sūtras *known as the* Prajñāpāramitā *(‘Perfection of Wisdom’), can be seen in his foundational Mūlamadhyamakakārikā(Fundamental Central Way Verses). Therein he expounds the central Buddhist doctrines of the Middle Path in terms of interdependent origination (*pratītyasamutpāda*), conventional language (*prajñapti*), no-self nature (*niḥsvabhāva*) and voidness (*śūnyatā*). He grants that the* dharma *taught by the enlightened ones is dependent upon two realities (*dve satye samupāśritya*) - the conventional reality of the world (*lokasaṃvṛtisatyam*) and reality as the ultimate (*satyam paramārthataḥ*). Although voidness is central to Madhyamaka, we are warned against converting* śūnyatā *into yet another ‘ism’.*

Historically, Madhyamaka in India comprises three periods - the early period (second to fifth century), represented by the activities of Nāgārjuna, Āryadeva and Rāhulabhadra; the middle period (fifth to seventh century) exemplified by Buddhapālita and Bhāvaviveka (founders respectively of the Čast;Prāsaōgika and Čast;Svātantrika schools of Madhyamaka), and Candrakīrti; and the later period (eighth to eleventh century), which includes Śāntarakṣita and Kamalaśīla, who fused the ideas found in the Madhyamaka and Yogācāra systems. Many of the Indian Madhyamaka scholars of the later period contributed to Madhyamaka developments in Tibet.

1 The early period (second to fifth century)

Nāgārjuna (*c.* AD 150-200). Nāgārjuna’s life story can be seen in such writings as Xuanzang’s *Travels in the Western World* and Kumārajīva’s *History of the Bodhisattva Nāgārjuna* (both in Chinese), and the histories of Buddhism by Bu-ston and Tāranātha (in Tibetan). Most of the accounts found in these works, however, are fictions and there are discrepancies between the Chinese and Tibetan traditions. But since Kumārajīva (AD 350-409) lived relatively close to the period attributed to Nāgārjuna and was a great scholar of *Prajñāpāramitā* (‘Perfection of Wisdom’) literature, certain information given in his account can be trusted from certain perspectives.

Both archeological records and textual evidences point to Nāgārjuna as a historical person. For example, in southern India, near the river Kushnara, there remains a cave named Nāgārjunakoṇḍa, and Nāgārjuna’s association with such kings as the King of Satavana is recorded in the *Suhṛllekha (A Letter to a Friend)* and the *Ratnāvali (Garland of Jewels)*.

Many works are attributed to Nāgārjuna, among which the following are considered by scholars to be genuine: *Mūlamadhyamakakārikā(Fundamental Central Way Verses)*, *Yuktiṣaṣṭikā(Sixty Verses on Reasoning)*, *Śūnyatāsaptati (Seventy-Verse Commentary on Emptiness)*, *Vigrahavyāvartani (Refutation of Objections)*, *Vaidalyasūtra (Teaching of Vaidalya)*, *Ratnāvali*, *Suhṛllekha* and *Pratītyasamutpāda-hṛdayakārikā(Verses on the Heart of Interdependent Origination)*.

Nāgārjuna developed his philosophy of *śūnyatā* (voidness) as a critical response to views held by Indian Realists such as Sāōkhya and Vaiśeṣika, the Indian schools of logic such as the Nyaiyāyika, and such Hīnayāna Buddhists as the Sarvāstivādas and other Abhidharma philosophers. Although the Abhidharma ideas that Nāgārjuna criticized did not coincide totally with those found in Sarvāstivāda, the idea of existence developed by the Realists did (see Buddhism, Ābhidharmika schools of). Nāgārjuna also aimed to refute non-Buddhist schools such as Sāōkhya and Vaiśeṣika. It was the idea that the objects of perception possess substantive qualities in the external world - the common thread among these Realist schools - that Nāgārjuna attacked.

The Indian system of logic was both the mother and opponent of Nāgārjuna’s system of logic. Without doubt, tenets such as *chala* (quibble), *jāti* (analogue), *nigrahasthana* (defeat), and so on, found in the *Nyāyasūtra (Teaching on Logical Arguments)*, were forerunners of Nāgārjuna’s system of critique. Also his use of *prasaōga* (*reductio ad absurdum*) is an application of the *tarka* (reasoning) method found in the *Nyāyasūtra* (see

Nyāya-Vaiśeṣika §6).

Āryadeva (*c.* AD 170-270). It is said that Āryadeva was born in southern India or perhaps Sri Lanka and was a disciple of Nāgārjuna. His life story can be seen in such writings as Xuanzang's *Travels in the Western World*, Kumārajīva's *History of the Bodhisattva Āryadeva* and Candrakīrti's commentary, *Catuḥśatakavṛtti*.

Three works are attributed to Āryadeva: *[Bodhisattvayogācāra-]Catuḥśataka (Text of Four Hundred Verses)* (Sanskrit, Chinese translation and Tibetan), *Śataśāstra (A Hundred Verses)* (Chinese translation only) and *Akṣaraśataka* (Tibetan and Chinese translation). Kumārajīva's Chinese translation of the *Śataśāstra* is a popular text with the Sanlun school of Chinese and Japanese (Sanron) Buddhism. With regard to the *[Bodhisattvayogācāra-]Catuḥśataka*, there remain Candrakīrti's commentary in Tibetan translation and Dharmapāla's (530-61) commentary in Chinese translation; however, in each case, only the last nine chapters of the text appear. Only about one-third of the Sanskrit original remains. Although the whole work can be found in Tibetan translation, the difficulties of the first half of the Tibetan text mean that very little work has been done on this part.

Rāhulabhadra (*c.* AD 200-300). Little is known of Rāhulabhadra other than that he was Āryadeva's disciple. Of his compositions, two Sanskrit works remain: *Prajñāpāramitāstotra (Stotra on the Perfection of Wisdom)*, attributed in Tibetan Tripiṭaka to Nāgārjuna, and *Saddharmapuṇḍarīkastava (Stava on the Lotus of the Wonderful Law)*. Other works seem to have been attributed to him, as some of his verses are quoted by Asaōga and Paramārtha in their works.

2 The middle period (fifth to seventh century)

In the first chapter of Avalokitavrata's (seventh century?) commentary on the *Prajñāpradīpa (Lamp of Wisdom)* and in the postscript found in Nāgārjuna's own work, the *Akutobhayā (Nāgārjuna's Auto Commentary)*, it is said there were eight commentaries on the *Mūlamadhyamakakārikā*; however, only those by Buddhapālita, Bhāvaviveka, and Candrakīrti are renowned, as the remainder are either not very useful, or are not extant at present. Along with Avalokitavrata, Śantideva (*c.*650-700) and Prajñākaramati (*c.*950-1030) were active during this period.

Avalokitavrata's *Prajñāpradīpaṭīkā (Lamp of Wisdom Commentary)*, extant in Tibetan translation, is a huge text and a very erudite commentary on the various Indian and Buddhist schools; consequently, it serves as a very important source book. Avalokitavrata knew about Candrakīrti and Dharmakīrti (*c.*600-60), but because he did not utilize their logic, we can surmise that he was their contemporary.

In the histories of Buddhism by Bu-ston and Tāranātha, Śantideva is credited as the author of the *Śikṣāsamuccaya (A Compendium of Buddhist Doctrine)*, the *Sūtrasamuccaya (A Compendium of Buddhist Sutras)* and the *Bodhicaryāvatāra (Entering the Path of Enlightenment)*. The *Sūtrasamuccaya*, extant in the Tibetan canon, purports to be by Nāgārjuna, but because some of the sixty or so *sūtras* quoted in it were composed after Nāgārjuna's death, this attribution is difficult as the text stands.

Although commentaries on Śantideva's *Bodhicaryāvatāra* abound, it is Prajñākaramati's *Bodhicaryāvatārapañjika (Entering the Path of Enlightenment Commentary)* which is the most famous. It comments on the first nine chapters, but not the tenth. Prajñākaramati probably began it as a commentary on the ninth chapter, and then added commentary on the first eight chapters later. Judging from his criticism of Sautrāntika and Yogācāra, we can assume that Prajñākaramati was a Mādhyamika, but it is difficult to determine to which school he belonged. Although in terms of his dates Prajñākaramati falls into the later period, he is discussed here as a commentator on Śantideva's work.

According to later Tibetan doxographies, the Middle Period is also characterized by Madhyamaka splitting into the Čast;Prāsaōgika and Čast;Svātantrika schools.

Buddhapālita (*c.*470-540). Buddhapālita's *Mūlamadhyamakavṛtti (Fundamental Central Way Verses Commentary)*, a commentary in twenty-seven chapters, exists only in Tibetan translation. Although from the seventh *kārikā* of chapter twenty-three the content of the text is identical with Nāgārjuna's *Akutobhayā*, its importance can be inferred from Bhāvaviveka's vehement criticism of it and Candrakīrti's concerted defence. The text's distinctive character lies in Buddhapālita's presentation of Nāgārjuna's use of dilemma and tetralemma from

the standpoint of plural *prasaōgas* - that is, he divides the tetralemma into two or four different *prasaōga* (*reductio ad absurdum*) arguments. It is probably for this reason that Buddhapālita is seen as the founder of the Čast;Prāsaōgika school and was criticized by Bhāvaviveka.

Bhāvaviveka (*c.*500-70). Bhāvaviveka, or Bhavya, is known by many different names, but because Candrakīrti, in his *Prasannapāda (Lucid Exposition)*, calls him Bhāvaviveka, he is known generally by that name. He is said to have written four works: *Prajñāpradīpa[-mūlamadhyamakavṛtti]*, *Madhyamakahṛdayakārikā*, *Tarkajvālā (Blaze of Argument)* (*Madhyamakahṛdayavṛtti*) and *Dashengzhangzhenlun* (extant in Chinese only). In the Tibetan canon there is another work, the *Nikāyabhedavibhaōga-vyākhyāna*, attributed to Bhāvaviveka, but its content corresponds to the discussion of the Hīnayāna found in fourth chapter of the *Tarkajvālā*. The authenticity of two other works ascribed to him, the *Madhyamakaratnapradīpa (Jewel of the Central Way Lamp)* and the *Madhyamakārtha-saṃgraha*, is doubtful.

The *Prajñāpradīpa[-mūlamadhyamakavṛtti]* is the first full-scale commentary on the *Mūlamadhyamakakārikā* and is important in two respects. First, Bhāvaviveka's interpretation of the various arguments presented by Nāgārjuna was strongly influenced by Dignāga's logic. Bhāvaviveka established many categorical syllogisms, the so-called *svatantra-anumāna* (independent inference), and hence his system is known as the Čast;Svātantrika school. Second, he criticized Buddhapālita's version of *prasaōga* as being merely *prasaōga* without the minor and major premises.

The *Madhyamakahṛdayakārikā (Verses on the Heart of the Central Way)* consists of eleven chapters, but it is only the first three that discuss Madhyamaka philosophy. In the rest, Bhāvaviveka discusses the doctrines of Hīnayāna Buddhism, Yogācāra, Sāōkhya, Vaiśeṣika, Vedānta and other schools. In this manner, he establishes the Madhyamaka on the one hand, and on the other he criticizes other schools and thus develops his work around the system of doctrinal classification that was further developed by scholars such as Śāntarakṣita. The Sanskrit manuscript of this text was discovered circa 1938.

The *Tarkajvālā*, extant only in Tibetan translation, is Bhāvaviveka's auto-commentary on the *Prajñāpradīpa*. Because within this text, reference to Bhāvaviveka is made by the title *ācarya*, there is some doubt as to whether Bhāvaviveka is the author. The *Dashengzhangzhenlun* has been translated into French by Louis de la Vallée Poussin, but because the text is difficult and its contents differ from the *Prajñāpradīpa* and the *Madhyamakahṛdayakārikā*, research on it has been slow and laborious.

Candrakīrti (*c.*600-50). Candrakīrti's *Prasannapadā* is not only the sole extant Sanskrit commentary on Nāgārjuna's *Mūlamadhyamakakārikā* but is also the one from which the Sanskrit *kārikās* are derived. His *Madhyamakāvatāra* discusses the essentials of the Madhyamaka in accordance with the stages of the ten perfections found in the *Daśabhūmikasūtra (Teaching on the Ten Stages)*. Other works attributed to Candrakīrti, in Tibetan translations, are the *Pañcaskandhaprakaraṇa (Five Aggregates Commentary)*, and commentaries on the *Śūnyatāsaptati*, the *Yuktiṣaṣṭika* and the *Catuḥśataka*.

Čast;Svātantrika and Čast;Prāsaōgika. The fact that Bhāvaviveka criticized and Candrakīrti defended Buddhapālita indicates a two-way split in the Madhyamaka school, although the terms 'Prāsaōgika' and 'Svātantrika' are not to be found in any of the extant Sanskrit texts. They are probably derived from translating into Sanskrit the Tibetan terms *thal 'gyur ba* and *rang rgyud pa* respectively. Although these terms are found in Tibetan Buddhist literature prior to Tsong kha pa, it is he who can be credited with giving them prominence, after which they began to be utilized in the Tibetan *Grub-mtha'* texts. To understand the manner in which the Čast;Prāsaōgikas and the Čast;Svātantrikas develop their respective theses requires a comprehensive background in the development of logic in India. The controversy between the two was not settled by Candrakīrti; its development is closely aligned with the logical proofs for *reductio ad absurdum* arguments produced after the eighth century and with the idea of *antarvyāpti* (intrinsic determination of universal concomitance) introduced by eleventh-century Buddhist logicians. Thus, in discussing the controversy between the two, one must take into consideration the developments in logic that occured after Candrakīrti.

3 The later period (eighth to eleventh century)

The special characteristics of the later period, which began with Śāntarakṣita, were: (1) the influence of Dharmakīrti's logico-epistemological school (although there was still dependence on Nāgārjuna's thought); (2) the

fact that most philosophers belonged to the Svātantrika school (an exception is Prajñākaramati); and (3) the incorporation of tenets of the Yogācāra tradition. Madhyamaka of this period can be seen as a rendezvous between Madhyamaka and Yogācāra (see Dharmakīrti; Buddhism, Yogācāra school of). As well as the thinkers described below, there were others, such as Jitari, Bodhibhadra and Advayavajra (eleventh century), who wrote expositions of the doctrines of the various Buddhist schools, while others still - for example, Kambala (*c.*700), Ratnākaraśanti (*c.*eleventh century) and Atīśa (982-1055) - were actively engaged in the synthesis of Madhyamaka and Yogācāra in India and in the development of Madhyamaka Buddhism in Tibet.

Jñānagarbha (eighth century). Very little is known about Jñānagarbha, except that he was Śāntarakṣita's teacher and the author of the *Satyadvayavibhaōga (Analysis of the Two Realities)*, the *Satyadvayavibhaōgavṛtti (Analysis of the Two Realities Commentary)* and the *Yogabhāvanāmārga (Path to the Practice of Yoga)*, all extant in Tibetan only. He translated texts on Madhyamaka and epistemology into Tibetan and consequently may have entered Tibet before Śāntarakṣita.

Śāntarakṣita (*c.*725-84). Śāntarakṣita was a scholar-monk in Nālandāwho composed the *Tattvasaṃgraha*, the *Madhyamakālaṃkāra*, and his own commentary on it, the *Madhyamakālaṃkāravṛtti*, and a commentary on Jñānagarbha's *Satyadvayavibhaōga*. With the exception of the first, which can also be found in Sanskrit, all are extant in Tibetan only. In criticizing the Indian philosophical traditions, both Buddhist and non-Buddhist, Ś āntarakṣita gives a wealth of information regarding the philosophical status of the time. The reason for his critical analysis was of course to establish Madhyamaka as the highest doctrine of all. Although he considered *śūnyatā* as the highest truth, he claimed that from the worldly level one should accept the Yogācāra claim of *vijñaptimātra* (information-only), and thus he can be seen as an adherent of the Yogācāra-Madhyamaka. In so far as he respected the system of inference, he can be seen as an adherent of the Čast;Svātantrika position. In 763, he entered Tibet and then returned to India. He returned again to Tibet in 771 and worked together with Padmasaṃbhava to establish the bSam-yas temple. He also initiated the first six monks of Tibet and devoted the rest of his life to the development of Buddhism there.

Kamalaśīla (*c.*740-97). A student of Śāntarakṣita, Kamalaśīla wrote brilliant commentaries on his teacher's works, the *Tattvasaṃgrhapañjika (Compendium of Principles Commentary)* and the *Madhyamakālaṃkārapañjika (Central Way Ornament Commentary)*. Besides these, he wrote the *Madhyamakāloka (Light of Central Way)*, the *Tattvāloka (Light of Reality)* and the *Sarvadharmaniḥsvabhāvasiddhi (Establishment of the No-Self-Nature of all Dharmas)*. Invited by King Khri srong lde brtsan, Kamalaśīla entered Tibet in 794. It is said that he defeated the Chinese monk, Hva-shang Ma-he-yan, in a debate held in bSam-yas (Samyay) monastery. The Madhyamaka tradition is supposed to have become firmly established in Tibet as a result. For the Tibetan Buddhists he composed a trilogy known as the First, Second and Third *Bhāvanākrama (Steps of Religious Meditative Practices)*, in which he denounced the 'sudden enlightenment' view held by Chinese Chan Buddhists (see Buddhist philosophy, Chinese §9).

Vimuktisena (eighth century). Vimuktisena, teacher of Haribhadra, was a well-known figure in the Tibetan tradition, but his biography is not clear. His *Abhisamayālaṃkāravṛtti (Ornament of Realizations Commentary)* is a commentary on the *Abhisamayālaṃkāra (Ornament of Realizations)* attributed to the teacher Maitreyanātha, who expounded the foundational doctrine of Yogācāra. As not much is known about this text, it is difficult to determine the extent of Vimuktisena's dedication to Madhyamaka thought. According to the Tibetan tradition, he belongs to the same lineage as Śāntarakṣita and Kamalaśīla.

Haribhadra (*c.*800). Haribhadra composed a huge treatise called the *Aṣṭasāhasrikāprajñāpāramitāvyākhyā Abhisamayālaṃkārāloka*, a commentary on the *Aṣṭasāhasrikāprajñāpāramitāsūtra (Teaching of the Perfection of Wisdom in 8,000 Verses)* in accordance with the divisions of the *Abhisamayālaṃkāra* attributed to Maitreyanātha. In this treatise, he criticized the Sarvāstivāda, the Sautrāntika, the Alīkākāravāda Yogācāra (who hold the theory of the unreal image of cognition) and the Satyākāravāda Yogācāra (who hold the theory of the real image of cognition) by following the method of critique in Śāntarakṣita's *Madhyamālaṃkāra*. He also explained the basic Madhyamaka teaching of no self-nature (*niḥsvabhāva*) for all entities and having classified the causal principle into four types (many causes, one effect; many causes, many effects; one cause, many effects; one cause, one effect) he disproved all of them.

4 Madhyamaka in Tibet

Buddhism was first introduced into Tibet during the reign of King Khri srong lde brtsan (741-97). At that time, Ś āntarakṣita was invited to inaugurate the bSam-yas monastery and initiated the first six monks (*Sad Mi Drug*) of Tibetan origin. Later, Kamalaśīla was invited. Buddhist texts were translated and Buddhist studies advanced, but because both Śāntarakṣita and Kamalaśīla were adherents of Madhyamaka thought (*dBu-ma-pa*), Madhyamaka had a great influence on Tibetan Buddhism.

However, influence was not exerted from India alone, for Chinese Chan was also making its presence felt in Tibet. This interaction led to the famous debate between the Chinese Chan master Hva-shang (also Ho-shang) Ma-he-yan and Kamalaśīla in the latter part of the eighth century. The outcome established the superiority of Kamalaśīla and the Indian tradition, and resulted in Khri srong lde brtsan requesting Kamalaśīla to explain what the nonsubstantive view of phenomena meant in the context of the three learnings of listening, thinking and practice; as a response, Kamalaśīla proceeded to compose the First *Bhāvanākrama (Stages of Practice)* (*sGom-rim dang-po*). When asked how to put into practice such a teaching, he composed the Second *Bhāvanākrama* (*sGom-rim bar-pa*), and finally, when asked what the result would be, he composed the Third and last *Bhāvanākrama* (*sGom-rim tha-ma*). In this text, he criticized the mistake made by Hva-shang Mahāyāna. He presented this to the king, who was overjoyed with it. Consequently, Kamalaśīla composed a commentary (*Don-'grel*), the *Madhyamakāloka* (*dBu-ma snang-ba*), in which he synthesized the correct teaching and the correct principle.

Although Śāntarakṣita and Kamalaśīla are seen as Yogācāra-Mādhyamikans, their activities are more representative of an Indian Madhyamaka tradition in Tibet rather than an indigenous Tibetan Madhyamaka. Unlike the case of the Indian subcontinent, Madhyamaka ideas in Tibet are found within the various doctrines of Tibetan Buddhist orders rather than constituting an independent Madhyamaka Buddhist school. The Tibetan *Grub-mtha'* texts discuss Madhyamaka as a single system, but what these texts explain are the tenets of Madhyamaka with respect to a general classification of doctrine rather than with respect to the Madhyamaka school in particular. Consequently, a unique feature of Tibetan Buddhism is that the indigenous schools incorporate tenets of several Indian Buddhist traditions, such as Sarvāstivāda, Sautrāntika, Yogācāra and Madhyamaka, and therefore it is difficult to discuss Madhyamaka as an indigenous school in Tibet. This means that to investigate Madhyamaka in Tibet is to examine how the Tibetan Buddhist schools, such as the dGe-lugs-pa (Gelukba), the Sa-skya-pa (Sagyaba), the rNying-ma-pa (Nyingmaba), and the bKa'-brgyud-pa (Gagyuba), incorporate the foundational Indian Madhyamaka tenets of *śūnyatā*, *saṃvṛtisatya*, *paramārthasatya*, and so on, within their own systems.

Among the various schools, it is with respect to the dGe-lugs-pa school that we find the most comprehensive discussion of the Madhyamaka system. The dGe-lugs-pa was founded by Tsong kha pa Blo bzang grags pa (Dzongkaba Losang dragba, 1357-1419), who at the age of nineteen heard a lecture on the *Prajñāpāramitā* from Kun-dga'-dpal, who belonged to the Sa-skya-pa school, and also heard lectures on the *Madhyamakāvatāra* and *Abhidharmakośa (Treasury of Higher Dharma)* from Red mda' ba (Rendawa, 1349-1412). He wrote the *gSer-phreng*, a commentary on the *Abhisamayālaṃkāra*, when he was thirty-one years old, but we cannot see Tsong kha pa's own thinking appearing yet. At thirty-three he began to study under dBu-ma-pa (Umaba), to whom he addressed questions regarding the Čast;Svatāntrika (Rang-rgyud-pa, ranggyüba) and the Čast;Prāsaōgika (Thal-'gyur-ba, talgyurwa). When he was forty-six he wrote the *Lam-rim-chen-mo (The Great Stages of the Path)*, a text which was modelled on Atīśa's *Bodhipathapradīpa* and finally established Tsong kha pa's original thinking regarding Madhyamaka. He severely criticized the normative interpretation in Tibet that *śūnyatā* referred to the view of neither existence nor nonexistence held by the mTha'-bral dbu-ma'i lugs ('school of Madhyamaka free of extremes'). Instead, he stressed that *śūnyatā* was absolutely beyond any claim that, for example, the absolute is freed from the two extreme views and also from conventional language, which resembles the view held by Hva-shang Mahāyāna that Buddhahood is attained when one is freed from all discriminations.

Tsong kha pa's understanding of Madhyamaka is expressed again and again in his works, for example, the *Legs-bshad snying-po (Essence of Good Explanations)*, the *Rigs-pa'i rgya-mtsho (Ocean of Reasoning)* and the *gDongs-pa rab-gsal (Exposition of Intention)*. He was severely criticized by Śā-kya mchog-ldan (1428-1507) in his *dBu ma rnam nges (Determination of the Middle)* and by such mTha'-bral dbu-ma'i lugs scholars as Śā-skya sTag-tshang-pa (1405-?) in his *Grub-mtha' kun-shes (All-knowing Tenets)* and Go ram pa (Goramba, 1429-89) in his *lTa ba'i shan 'byed*. In response to these criticisms, Se-ra rJe-tsun-pa Chos-kyi rgyal-mtshan (1469-1546) and his disciple bDe legs nyi ma attacked Śā-skya sTag-tshang-pa and Go ram pa in their *lTa-ngan-mun-sel (Light Within Views)* and the great scholar Jam dbyangs bzhad pa (Jamyang shayba, 1648-1722) attacked Śā-kya

mchog-ldan in his *Grub-mtha' chen-mo (Great Tenets)*.

Buddhism, Yogācāra school of

Yogācāra is one of the two schools of Indian Mahāyāna Buddhism. Its founding is ascribed to two brothers, Asaōga and Vasubandhu, but its basic tenets and doctrines were already in circulation for at least a century before the brothers lived. In order to overcome the ignorance that prevented one from attaining liberation from the karmic rounds of birth and death, Yogācāra focused on the processes involved in cognition. Their sustained attention to issues such as cognition, consciousness, perception and epistemology, coupled with claims such as 'external objects do not exist' has led some to misinterpret Yogācāra as a form of metaphysical idealism. They did not focus on consciousness to assert it as ultimately real (Yogācāra claims consciousness is only conventionally real), but rather because it is the cause of the karmic problem they are seeking to eliminate.

Yogācāra introduced several important new doctrines to Buddhism, including vijñaptimātra, *three self-natures, three turnings of the* dharma-*wheel and a system of eight consciousnesses. Their close scrutiny of cognition spawned two important developments: an elaborate psychological therapeutic system mapping out the problems in cognition with antidotes to correct them and an earnest epistemological endeavour that led to some of the most sophisticated work on perception and logic ever engaged in by Buddhists or Indians.*

Although the founding of Yogācāra is traditionally ascribed to two half-brothers, Asaōga and Vasubandhu (fourth-fifth century BC*), most of its fundamental doctrines had already appeared in a number of scriptures a century or more earlier, most notably the Saṃdhinirmocanasūtra (Elucidating the Hidden Connections) (third-fourth century* BC*). Among the key Yogācāra concepts introduced in the Saṃdhinirmocanasūtra are the notions of 'only-cognition' (*vijñaptimātra*), three self-natures (*trisvabhāva*), warehouse consciousness (*ālayavijñāna*), overturning the basis (*āśrayaparāvṛtti*) and the theory of eight consciousnesses.*

The Saṃdhinirmocanasūtra proclaimed its teachings to be the third turning of the wheel of dharma*. Buddha lived around sixth-fifth century* BC*, but Mahāyāna Sūtra did not begin to appear probably until five hundred years later. New Mahāyāna Sūtra continued to be composed for many centuries. Indian Mahāyānists treated these Sūtras as documents which recorded actual discourses of the Buddha. By the third or fourth century a wide and sometimes incommensurate range of Buddhist doctrines had emerged, but whichever doctrines appeared in Sūtras could be ascribed to the authority of Buddha himself. According to the earliest Pāli Sutta, when Buddha became enlightened he turned the wheel of* dharma*, that is, began to teach the path to enlightenment. While Buddhists had always maintained that Buddha had geared specific teachings to the specific capacities of specific audiences, the Saṃdhinirmocanasūtra established the idea that Buddha had taught significantly* different *doctrines to different audiences according to their levels of understanding; and that these different doctrines led from provisional antidotes (*pratipakṣa*) for certain wrong views up to a comprehensive teaching that finally made explicit what was only implicit in the earlier teachings. In its view, the first two turnings of the wheel - the teachings of the Four Noble Truths in Nikāya and Abhidharma Buddhism and the teachings of the Madhyamaka school, respectively - had expressed the* dharma *through incomplete formulations that required further elucidation (*neyārtha*) to be properly understood and thus effective. The first turning, by emphasizing entities (such as* dharmas *and aggregates) while 'hiding' emptiness, might lead one to hold a substantialistic view; the second turning, by emphasizing negation while 'hiding' the positive qualities of the* dharma*, might be misconstrued as nihilism. The third turning was a middle way between these extremes that finally made everything explicit and definitive (*nītartha*). In order to leave nothing hidden, the Yogācārins embarked on a massive, systematic synthesis of all the Buddhist teachings that had preceded them, scrutinizing and evaluating them down to the most trivial details in an attempt to formulate the definitive Buddhist teaching. Stated another way, to be effective all of Buddhism required a Yogācārin reinterpretation. Innovations in* abhidharma *analysis, logic, cosmology, meditation methods, psychology, philosophy and ethics are among their most important contributions. Asaōga's magnum opus, the Yogācārabhūmiśāstra (Treatise on the Stages of Yoga Practice), is a comprehensive encyclopedia of Buddhist terms and models, mapped out according to his Yogācārin view of how one progresses along the stages of the path to enlightenment.*

1 Historical survey

Asaōga and Vasubandhu became the first identifiable Yogācārins, each having initially been devoted to other

schools of Buddhism. Both were prolific authors, although Asaōga attributed a portion of his writings to Maitreya, the future Buddha living in Tuṣita heaven. Some modern scholars, such as H. Ui (1929) have argued that this Maitreya was an actual human teacher, not the future Buddha, but the tradition is fairly clear. After Asaōga has spent twelve years of fruitless meditation alone in a cave, in a moment of utter despair Maitreya appears to him and transports him to Tuṣita heaven where he instructs him in previously unknown Yogācārin works. These works Asaōga then introduces to his fellow Buddhists. Precisely which texts these are is less clear since the Chinese and Tibetan traditions assign different works to Maitreya.

According to tradition, Vasubandhu first studied Vaibhāṣika Buddhist teachings, writing an encyclopedic summary of those teachings, the *Abhidharmakośa (Treasury of Abhidharma)*, that has become a standard work throughout the Buddhist world. As he grew critical of Vaibhāṣika teachings, he wrote a commentary on that work refuting many of its tenets. Intellectually restless for a while, Vasubandhu composed a variety of works that chart his journey to Yogācāra, the best known of these being the *Karmasiddhiprakaraṇa (Investigation Establishing Karma)* and *Pañcaskandhakaprakaraṇa (Investigation into the Five Aggregates)*. These works show a deep familiarity with the Abhidharmic categories discussed in the *Abhidharmakośa* and attempts to rethink them; the philosophical and scholastic disputes of the day are also explored and the new positions Vasubandhu formulates in these texts bring him closer to Yogācārin conclusions. On the basis of some conflicting accounts in old biographies of Vasubandhu, a few modern scholars have argued that these texts along with the *Abhidharmakośa* were the work of another author. However, as the progression and development of his thought is so strikingly evident in these works and the similarity of vocabulary and style of argument so apparent across the texts, the theory of the existence of two Vasubandhus has little merit.

The writings of Asaōga (and/or Maitreya) and Vasubandhu ranged from vast encyclopedic compendia of Buddhist doctrine (for example, *Yogācārabhūmiśāstra*, *Mahāyānasaṃgraha*, *Abhidharmasamuccaya*), to terse versified encapsulations of Yogācāra praxis (for example, *Triṃśikā*, *Trisvabhāvanirdeśa*), to focused systematic treatises on Yogācāra themes (for example, *Viṃśatika*, *Madhyāntavibhāga*), to commentaries on well-known Mahāyānic scriptures and treatises, such as the *Saddharmapuṇḍarīka (Lotus)* and the *Vajracchedika (Diamond-cutter) Sūtras*.

As the *Saṃdhinirmocanasūtra* offers highly sophisticated doctrines, it is reasonable to assume that these ideas had been under development for some time, possibly centuries, before this scripture emerged. Since Asaōga and Vasubandhu lived a century or more after the *Saṃdhinirmocana* appeared, it is also reasonable to assume that these ideas had been further refined by others in the interim. Thus the traditional claim that the two brothers are the founders of Yogācāra at best could be considered to be a half-truth. According to tradition Asaōga converted Vasubandhu to Yogācāra after having been taught by Maitreya; he is not known to have had any other notable disciples. Tradition does assign two major disciples to Vasubandhu: Dignāga, the great logician and epistemologist, and Sthiramati, an important early Yogācāra commentator. It is unclear whether either ever actually met Vasubandhu (current scholarship deems it unlikely). They may have been disciples of his thought, acquired exclusively from his writings or through some forgotten intermediary teachers. These two disciples exemplify the two major directions into which Vasubandhu's teachings split.

After Vasubandhu Yogācāra developed into two distinct directions or branches: a logico-epistemic tradition exemplified by such thinkers as Dignāga, Dharmakīrti, Śāntarakṣita and Ratnakīrti; an Abhidharmic psychology, exemplified by such thinkers as Sthiramati, Dharmapāla, Xuanzang (Hsüan-tsang (*c*.659 bc)) and (again) Ratnakīrti (see Buddhism, Ābhidharmika schools of). While the first branch focused on questions of epistemology and logic, the other wing refined and elaborated the Abhidharma analysis developed by Asaōga and Vasubandhu. These branches were not entirely separate, and many Buddhists wrote works that contributed to both. Dignāga, for instance, besides works on epistemology and logic also wrote a commentary on Vasubandhu's *Abhidharmakośa*. What united both branches was a deep concern with the process of cognition, that is, analyses of how we perceive and think. The former wing approached that epistemologically, while the latter wing approached it psychologically and therapeutically. Both identified the root of all human problems as cognitive errors that needed correction.

Several Yogācāra notions basic to the Abhidharma wing came under severe attack by other Buddhists, especially the notion of *ālayavijñāna*, which was denounced as something akin to the Hindu notions of *ātman* (permanent, invariant self) and *prakṛti* (primordial substrative nature from which all mental, emotional and physical things evolve) (see Sāōkhya). Eventually the critiques became so entrenched that the Abhidharma wing atrophied. By the

end of the eighth century it was eclipsed by the logico-epistemic tradition and by a hybrid school that combined basic Yogācāra doctrines with Tathāgatagarbha thought. The logico-epistemological wing sidestepped much of the critique by using the term *cittasantāna*, or mindstream, instead of *ālayavijñāna*, for what amounted to roughly the same idea. It was easier to deny that a stream represented a reified self. The Tathāgatagarbha hybrid school was no stranger to the charge of smuggling notions of selfhood into its doctrines, as for example, it explicitly defined *tathāgatagarbha* as 'permanent, pleasant, *self* and pure'. Many Tathāgatagarbha texts argue for the acceptance of selfhood (*ātman*) as a sign of higher accomplishment. The hybrid school attempted to conflate *tathāgatagarbha* with the *ālayavijñāna*. Key works of the hybrid school include the *Laōkāvatārasūtra*, *Ratnagotravibhāga (Uttaratantra)* and in China the *Awakening of Faith*.

In China during the sixth and seventh centuries, Buddhism was dominated by several competing forms of Yogācāra (see Buddhist philosophy, Chinese). A major schism between orthodox versions of Yogācāra and Tathāgatagarbha hybrid versions was finally settled in the eighth century in favour of a hybrid version, which became definitive for all subsequent forms of East Asian Buddhism. Yogācāra ideas were also studied and classified in Tibet. The Nyingma and Dzog Chen schools settled on a hybrid version similar to the Chinese Tathāgatagarbha hybrid; the Gelugpas subdivided Yogācāra into a number of different types and considered them preparatory teachings for studying Prāsaōgika Madhyamaka, which Gelugpas ranked as the highest Buddhist teaching. The Tibetans, however, tended to view the logico-epistemological tradition as distinct from Yogācāra proper, frequently labelling them Sautrāntika instead.

2 Yogācāra contrasted with metaphysical idealism

The school was called Yogācāra (Yoga practice) because it provided a comprehensive, therapeutic framework for engaging in the practices that lead to the goal of the *bodhisattva* path, namely enlightened cognition. Meditation served as the laboratory in which one could study how the mind operated. Yogācāra focused on the question of consciousness from a variety of approaches, including meditation, psychological analysis, epistemology (how we know what we know, how perception operates, what validates knowledge), scholastic categorization and karmic analysis.

Yogācāra doctrine is summarized in the term *vijñaptimātra*, 'nothing-but-cognition' (often rendered as 'consciousness-only' or 'mind-only'), which has sometimes been interpreted as indicating a type of metaphysical idealism, that is, the claim that the mind alone is real and everything else is created by the mind. However, the Yogācārin writings themselves argue something very different. Consciousness (*vijñāna*) is not the ultimate reality or solution, but rather the root problem. This problem emerges in ordinary mental operations and it can only be solved by bringing those operations to an end.

Yogācāra tends to be misinterpreted as a form of metaphysical idealism primarily because its teachings are taken for ontological propositions rather than as epistemological warnings about karmic problems. The Yogācāra focus on cognition and consciousness grew out of its analysis of karma and not for the sake of metaphysical speculation. Two things should be clarified in order to explain why Yogācāra is not metaphysical idealism: the meaning of the term 'idealism' and the important difference between the way Indian and Western philosophers regard philosophy.

The term 'idealism' came into vogue roughly during the time of I. Kant (although it was used earlier by others, such as G.W. Leibniz) for one of two trends that had emerged in reaction to Cartesian philosophy. R. Descartes had argued that there were two basic yet separate substances in the universe: extension (the material world of things in space) and thought (the world of mind and ideas) (see German idealism). Subsequently, opposing camps took one or the other substance as their metaphysical foundation, treating it as the primary substance, while reducing the remaining substance to a derivative status. Materialists argued that only matter was ultimately real so that thought and consciousness derived from physical entities (such as chemistry, brain states). Idealists countered that the mind and its ideas were ultimately real and that the physical world derived from the mind (for example, the mind of God, G. Berkeley's *esse est percipi* (to be is to be perceived), or from ideal prototypes) (see Berkeley, G.). Materialists gravitated toward mechanical, physical explanations for why and how things existed, while Idealists tended to look for purposes - moral as well as rational - to explain existence. Idealism meant 'idea-ism', frequently in the sense of Plato's notion of 'ideas' (*eidos*), denoting ideal types that transcended the physical, sensory world and provided the form (*eidos*) that gave matter meaning and purpose. As materialism buttressed by advances in materialistic science gained wider acceptance, those inclined towards spiritual and theological aims turned

increasingly toward idealism as a countermeasure. Before long there were many types of materialism and idealism.

Idealism in its broadest sense came to encompass everything that was not materialism, which included so many different types of positions that the term lost any hope of univocality. Most forms of theistic and theological thought were, by this definition, types of idealism, even if they accepted matter as real, since they also asserted something as more real than matter, either as the creator of matter (in monotheism) or as the reality behind matter (in pantheism) (see Pantheism). Extreme empiricists who only accepted their own experience and sensations as real were also idealists. Thus, 'idealism' united monotheists, pantheists and atheists. At one extreme were various forms of metaphysical idealism which posited the mind as the only ultimate reality. The physical world was either an unreal illusion, or not as real as the mind that created it. To avoid solipsism (which is a subjectivized version of metaphysical idealism), metaphysical idealists posited an overarching mind that envisages and creates the universe.

A more limited type of idealism is epistemological, which argues that since knowledge of the world only exists in the mental realm we cannot know actual physical objects as they truly are, but only as they appear in our mental representations of them. Epistemological idealists could be ontological materialists, accepting that matter exists substantially; they could even accept that mental states derived at least in part from material processes. What they denied was that matter could be known in itself directly without the mediation of mental representations. Although unknowable in itself, the existence of matter and its properties could be known through inference based on certain consistencies in the way material things are represented in perception.

Transcendental idealism contends that not only matter, but also the self remains transcendental in an act of cognition. Kant and Husserl, who were both transcendental idealists, defined 'transcendental' as that which constitutes experience but is not itself given in experience. A mundane example would be the eye, which is the condition for seeing even though the eye does not see itself. By applying vision and drawing inferences from it, one can come to know the role eyes play in seeing, although one never sees one's own eyes. Similarly, things in themselves and the transcendental self could be known if the proper methods were applied for uncovering the conditions that constitute experience, although such conditions do not themselves appear in experience. Even when epistemological issues are at the forefront, it is ontological concerns, such as the status of self and objects, that are really at stake. Western philosophy rarely escapes this ontological slant. Those who accepted that both the self and its objects were unknowable except through reason and that such reason was their cause and purpose for existing - thus epistemologically and ontologically grounding everything in the mind and its ideas - were called absolute Idealists, such as F.W.J. von Schelling, G.W.F. Hegel and F.H. Bradley, since only such ideas are absolute while all else is relative to them (see Absolute, the).

With the exception of some epistemological idealists, what unites all the positions described thus far, including the materialists, is that they are ontological. They are concerned with the ontological status of the objects of sense and thought, as well as the ontological nature of the self who knows. Mainstream Western philosophy since Plato and Aristotle has treated ontology and metaphysics as the ultimate philosophic pursuit, with epistemology's role being little more than to provide access and justification for one's ontological pursuits and commitments. Since many of what are decried as philosophy's excesses - such as scepticism, solipsism and sophistry - have been accused of deriving from overactive epistemological questioning, epistemology has often been held to be suspect and in some theological formulations, considered entirely dispensable in favour of faith. Ontology is primary and epistemology is either secondary or expendable.

3 The role of epistemology

In Indian philosophy one finds the reverse of the positions described. Epistemology (*pramāṇavāda*) is primary both in the sense that it must be engaged in prior to attempting any other philosophical endeavour and that the limits of one's metaphysical claims are always inviolably set by the parameters established by one's epistemology. Before one can make claims, one must establish the basis on which such claims can be proven and justified. The Indians went so far as to concede that if one wishes to debate with an opponent, one must first find a common epistemological ground upon which to argue. Failing that, no meaningful debate can take place.

Since one's ontology (*prameya*) depends on what one's epistemology makes allowable, many Indian schools tried to include things in their list of valid means of knowledge (*pramāṇa*) that would facilitate their claims. Hindus, for

instance, considered their Scriptures to be valid means of knowledge, but other Indians, such as Buddhists and Jains, rejected the authority of the Hindu Scriptures. Therefore, if a Hindu debated with a Buddhist or Jain, he or she could not appeal to the authority of Hindu Scriptures, but had to find common epistemological ground. In the case of Buddhism that would be perception and inference; in the case of Jainism, it would only be inference. All schools except Jains accepted perception as a valid means of knowledge, meaning that sensory knowledge is valid (if qualified as non-erroneous or nonhallucinatory). What is not presently observed but is in principle observable can be known by inference. Without actually seeing the fire, one knows it must exist on a hill when one sees smoke in that location because both fire and smoke are in principle observable entities and an observed necessary relation (*vyāpti*) exists between smoke and fire (think of the expression, there is no smoke without fire). If one were close to the fire on the hill, the fire could be observed. One cannot make valid inferences about things impossible to perceive, such as unicorns, since no necessary observable relation is obtainable so one cannot infer that a unicorn is on the hill. Perceptibility therefore is an indispensable component of both perception and inference, and thus for Buddhists, of all valid knowledge. In order to be considered 'real' (*dravya*) by the standards of Buddhist logic, a thing must produce an observable effect. Buddhists argued among themselves whether something was real only while it was producing this observable effect (the Sautrāntika position), or whether something could be considered real if it produced an observable effect at some moment during its existence (the Sarvāstivāda position). However, it was generally agreed that a thing must have observable causal efficacy (*kāraṇa*) in order to be considered real. This helps explain the centrality of perception and consciousness for Yogācāra theory.

The logico-epistemological branch of Yogācāra drew a sharp distinction between perception and inference. Perception involves sensory cognitions of unique, momentary, discrete particulars. Inference involves linguistic, conceptual universals, since words are meaningful and communicative only to the extent they designate and participate in universal classes commonly shared and understood by users of the language. Inferences are true or false depending on how accurately they approximate sensory particulars, but even when linguistically true, they are only still true relative (*saṃvṛti*) to the sensations they approximate. Conversely, sensation (and only sensation) is beyond language. Sensory cognition devoid of linguistic overlay or theoretical assertions (*samāropa*) is correct cognition and precisely, not approximately, true (*paramārtha*). While this seems to involve metaphysical claims about categories such as particulars and universals, sensation and language, in fact it is a request that we should cognize things as they are without imposing any metaphysical assertions or conceptual framework whatsoever. The cognitive and epistemic, not the metaphysical, is at stake. What is the case is beyond description, not because it is something ineffable residing outside or behind human experience, but because it is the very sensory stuff of human experience whose momentary unique actuality cannot be reduced to universalistic, eternalistic language or concepts. To interpret this position itself as a metaphysics of particularity is to miss its point.

4 Primacy of epistemology

Epistemological concerns pervade Indian philosophy. This is especially true of Buddhist philosophy. Many Buddhist texts assert that higher understanding has nothing to do with ontology, that focusing on the existence or nonexistence of something (*astināsti*, *bhāvābhāva*) is a misleading category error. They typically remove important items - such as emptiness and *nirvāṇa* - from ontological consideration by explicitly declaring that these have nothing to do with existence or nonexistence, or being and nonbeing. They further warn that this is not a licence to imagine a higher sense of existence or being into which such items are then subsumed or sublated. The Buddhist goal is not the construction of a more perfect ontology. Instead its primary target is always the removal of ignorance. Hence, while Buddhists frequently suspend ontological and metaphysical speculation (*tarka*), denouncing it as useless or dangerous, correct cognition (*samyagjñāna*) is invariably lauded. Even Madhyamakas, who question the feasibility of much of Buddhist epistemology, insist that we should understand where the errors lie and correct the way we cognize accordingly. Stated bluntly, Buddhism is concerned with seeing, not being, that is, epistemology rather than ontology.

Tellingly, no Indian Yogācāra text ever claims that the world is created by the mind. What they do claim is that we mistake our projected interpretations of the world for the world itself, that is, we take our own mental constructions to be the world. Their vocabulary for this is as rich as their analysis: *kalpanā* (projective conceptual construction), *parikalpa* and *parikalpita* (ubiquitous imaginary constructions), *abhūtaparikalpa* (imagining something in a locus in which it does not exist), *prapañca* (proliferation of conceptual constructions), to mention a

few. Correct cognition is defined as the removal of those obstacles which prevent us from seeing dependent causal conditions in the manner they actually become (*yathābhūtam*). For Yogācāra these causal conditions are cognitive, not metaphysical; they are the mental and perceptual conditions by which sensations and thoughts occur, not the metaphysical machinations of a Creator or an imperceptible domain. What is known through correct cognition is euphemistically called *tathatā*, or 'suchness', which the texts are quick to point out is not an actual thing, but only a word (*prajñaptimātra*).

What is crucial in the foregoing for understanding Yogācāra is that its attention to perceptual and cognitive issues is in line with basic Buddhist thinking and that this attention is epistemological rather than metaphysical. When Yogācārins discuss 'objects' they are talking about cognitive objects, not metaphysical entities. Rather than offer one more ontology, they attempt to uncover and eliminate the predilections and proclivities (*āśrava*, *anuśaya*) that compel people to generate and cling to such theoretical constructions. According to Yogācāra, all ontologies are epistemological constructions. Therefore, to understand how cognition operates is to understand how and why people construct the ontologies to which they cling. Ontological attachment is a symptom of cognitive projection (*pratibimba*, *parikalpita*). Careful examination of Yogācāra texts reveals that they make no ontological claims, except to question the validity of making those ontological claims. Such ontological silence derives from the fact that, were they to offer a metaphysical description, that description would be appropriated by its interpreters whose proclivities would project onto it what they wish reality to be, thereby reducing the description to their own presupposed theory of reality. Such projective reductionism is the problem and is the definition of *vijñaptimātra*: to mistake one's projections for that onto which one is projecting. Vasubandhu's *Triṃśikā(Thirty Verses)* states that if one clings to one's projection of the idea of *vijñaptimātra*, then one fails to dwell truly in the understanding of *vijñaptimātra* (verse 27 [1984]). Enlightened cognition free of all cognitive errors is defined as *nirvikalpajñāna*, or 'cognition without imaginative construction', that is, without conceptual overlay. Ironically, Yogācāra's interpreters and opponents could not resist reductively projecting metaphysical theories onto what Yogācārins did say, at once proving Yogācāra was right and making actual Yogācāra teachings that much harder to understand. Interpreting their epistemological analyses as metaphysical pronouncements fundamentally misconstrues their project.

The arguments Yogācāra deploys frequently resemble those made by epistemological idealists. Recognizing those affinities, early twentieth-century Western scholars compared Yogācāra to Kant. More recently scholars have begun to think that Husserl's phenomenology comes even closer. Indeed, there are intriguing similarities, for instance, between Husserl's description of noesis (consciousness projecting its cognitive field) and noema (the constructed cognitive object) on the one hand, and Yogācāra's analysis of the (cognitive) grasper and the grasped (*grāhaka* and *grāhya*) on the other hand. However, there are also important differences between the ideas of those Western philosophers and Yogācāra, most markedly that Kant and Husserl play down notions of causality, while Yogācāra developed complex systematic causal theories it deemed to be of the greatest importance; there is no counterpart to either karma or enlightenment in the Western theories, while these are the very *raison d'être* for all of Yogācāra theory and practice; finally, Western philosophies are produced to afford the best possible access to an ontological realm (at least sufficient to acknowledge its existence), while Yogācāra is critical of that motive in all its manifestations. To the extent that epistemological idealists can also be critical realists, Yogācāra may be deemed a type of epistemological idealism with the proviso that the purpose of its arguments was not to engender an improved ontological theory or commitment, but rather an insistence that we shift our attention to the epistemological and psychological conditions that compel us to construct and attach to ontological theories (seeEpistemology, Indian schools of; Ontology in Indian philosophy).

5 Karma

The key to Yogācāra theory lies in the Buddhist notions of karma which they inherited and rigorously reinterpreted (see Karma and rebirth, Indian conceptions of). As earlier Buddhist texts explained, karma is responsible for suffering and ignorance and consists of any intentional activity of body, language, or mind. Since the crucial factor is intent and intent is a cognitive condition, whatever is noncognitive must necessarily lack intent and be nonkarmic. Hence, by definition, whatever is noncognitive can have no karmic influence or consequences. Since Buddhism aims at overcoming ignorance and suffering through the elimination of karmic conditioning, Buddhism, they reasoned, is only concerned with the analysis and correction of whatever falls within the domain of cognitive conditions. Hence questions about the ultimate reality of that which is noncognitive are irrelevant for solving the

problem of karma. Further, Yogācārins emphasize that categories such as materiality (*rūpa*) are cognitive. Materiality is an abstract classification of the colours, textures and sounds experienced in acts of perception and it is only to the extent that they are experienced, perceived and ideologically grasped, thereby becoming objects of attachment, that they have karmic significance. Intentional acts also have moral motives and consequences. Since effects are shaped by their causes, an act with a wholesome intent would tend to yield wholesome fruits, while unwholesome intentions produce unwholesome effects.

In contrast to the cognitive karmic dimension, Buddhism considered material elements (*rūpa*) to be karmically neutral. The problem with material things is not their materiality, but the psychology of appropriation (*upādāna*) - desiring, grasping, clinging, attachment - that infests our ideas and perceptions of such things. It is not the materiality of gold that leads to problems, but rather our *ideas* about the value of gold and the attitudes and actions we engage in as a result of those ideas. Those ideas were acquired through previous experiences. By repeated exposure to certain ideas and cognitive conditions, one is conditioned to respond habitually in a similar manner to similar circumstances. Eventually these habits are embodied, becoming reflexive and presuppositional. For Buddhists this process of embodied conditioning (*saṃskāra*) is not confined to a single lifetime, but accrues over many. *Saṃsāra* (the continuous cycle of birth and death) is the karmic enactment of this repetition, the reoccurrence of cognitive embodied habits in new life situations and life forms.

For all Buddhists this follows a simple sensory calculus by which we are conditioned: pleasurable feelings we wish to retain, or repeat; painful feelings we wish to cut off, or avoid; pleasure and pain, reward and punishment, approval and disapproval. Our karmic habits (*vāsanā*) are constructed this way. Since nothing is permanent, pleasurable feelings cannot be maintained or repeated permanently; painful things (such as sickness and death) cannot be avoided permanently. However, we do imagine all sort of permanent things, from God to souls to essences, in an effort to avoid facing the fact that none of us has a permanent self. We believe that if we can prove something is permanent then we too have a chance for permanence. The greater the dissonance between our actual impermanent experience and our expectations for permanent desired ends, the more we suffer and the greater tendency (*anuśaya*) towards projecting our desires onto the world. The anxiety about our lack of self and all the cognitive and karmic mischief it generates is called several things by Yogācāra, including *jñeyāvaraṇa* (obstruction of the knowable, that is, our self-obsessions which prevent us from seeing things as they are) and *abhūtaparikalpa* (imagining something, such as permanence or a self, to exist in a locus in which it is absent).

6 The storage and ripening of karma

Previous Buddhists, especially in the Abhidharma schools, had developed a sophisticated metaphoric vocabulary to describe and analyse the causes and conditions of karma in terms of seeds (*bījā*). Just as a plant develops from its roots unseen underground, so do previous karmic experiences fester unseen in the mind; just as a plant sprouts from the ground when nourished by proper conditions, so karmic habits under the right causes and conditions reassert themselves as new experiences; just as plants reach fruition by producing new seeds that re-enter the ground to take root and begin regrowing a similar plant of the same kind, so karmic actions produce wholesome or unwholesome fruit that become latent seeds for a later, similar type of action or cognition. Just as plants reproduce only their own kind, so do wholesome or unwholesome karmic acts produce effects after their own kind. This cycle served as a metaphor for the process of cognitive conditioning, as well as the recurrent cycle of birth and death (*saṃsāra*). Since Yogācāra accepts the Buddhist doctrine of momentariness, seeds are said to perdure for only a moment during which time they become the cause of a similar seed that succeeds them. Momentary seeds are causally linked in sequential chains, each momentary seed a link in a chain of karmic causes and effects (see Momentariness, Buddhist doctrine of).

Seeds are basically divided into two types: wholesome and unwholesome. Unwholesome seeds are the acquired cognitive habits preventing one from reaching enlightenment. Wholesome, or pure, unpolluted seeds give rise to more pure seeds, which bring one closer to enlightenment. In general Yogācāra differentiates inner seeds (personal conditioning) from external seeds (being conditioned by others). One’s own seeds can be modified or affected by exposure to external conditions (external seeds), which can be beneficial or detrimental. Exposure to polluting conditions intensifies one’s unwholesome seeds, while contact with pure conditions, such as hearing the correct teaching (*Saddharma*), can stimulate one’s wholesome seeds to increase, thereby diminishing and ultimately eradicating one’s unwholesome seeds.

Another metaphor for karmic conditioning that accompanies the seed metaphor is ‘perfuming’ (*vāsanā*). A cloth exposed to the smell of perfume acquires its scent. Similarly one is mentally and behaviourally conditioned by what one experiences. This conditioning produces karmic habits, but just as the odour can be removed from the cloth so can one’s conditioning be purified of perfumed habits. Typically three types of perfuming are discussed: linguistic and conceptual habits; habits of self-interest and ‘grasping self’ (*ātmagrāha*), that is, the belief in self and what belongs to self; and habits leading to subsequent life situations (*bhāvāōgavāsanā*), that is, the long-term karmic consequences of specific karmic activities.

Yogācāra literature debates the relation between seeds and perfuming. Some claim that seeds and perfuming are really two terms for the same thing, that is, acquired karmic habits. Others claim that seeds are simply the effects of perfuming, so that all conditioning is acquired through experience. Still others contend that ‘seed’ refers to the chains of conditioned habits one already has (whether acquired in this life, in some previous life, or even ‘beginninglessly’), while ‘perfuming’ denotes the experiences one has that modify or affect the development of one’s seeds. ‘Beginningless’ might be understood as a corollary to Husserl’s term ‘transcendental’, that is, a causal sequence constituting a present experience whose own original cause remains undisclosed in this experience. Some claimed that one’s possibilities for enlightenment depended entirely on the sort of seeds one already possessed; perfuming merely acted as a catalyst, but could not provide wholesome seeds if one did not already possess them. Beings utterly devoid of wholesome seeds were called *icchantikas* (incorrigibles); such beings could never reach enlightenment. Some other Mahāyāna Buddhists, feeling that this violated the Mahāyāna dictum of universal salvation, attacked the incorrigibility doctrine.

The karmic cause of the fundamental disease (*duḥkha*) is desire expressed through body, speech, or mind. Therefore Yogācāra focused exclusively on cognitive and mental activities in relation to their intentions, that is, the operations of consciousness, since the problem was located there. Buddhism had always identified ignorance and desire as the primary causes of suffering and rebirth. Yogācārins mapped these mental functions in order to dismantle them. Because maps of this sort were also creations of the mind they too would ultimately have to be abandoned in the course of the dismantling, but their therapeutic value would have been served in bringing about enlightenment. This view of the provisional expediency of Buddhism can be traced back to Buddha himself. Yogācārins describe enlightenment as resulting from overturning the cognitive basis (*āśrayaparavṛtti*), that is, overturning the conceptual projections and imaginings which act as the base of our cognitive actions. This overturning transforms the basic mode of cognition from consciousness (*vi-jñāna*, dis-cernment) into *jñāna* (direct knowing). The *vi-* prefix is equivalent to *dis-* in English (dis-criminate, dis-tinguish) meaning to bifurcate or separate from. Direct knowing was defined as nonconceptual (*nirvikalpa*), that is, devoid of interpretive overlay.

7 Matter and cognitive appropriation

The case of material elements is important for understanding one reason why Yogācāra is not metaphysical idealism. No Yogācāra text denies materiality (*rūpa*) as a valid Buddhist category. On the contrary, Yogācārins include materiality in their analysis. Their approach to materiality is well rooted in Buddhist precedents. Frequently Buddhist texts substitute the term ’sensory contact’ (Pāli: *phassa*, Sanskrit: *sparśa*) for the term ’materiality’. This substitution is a reminder that physical forms are sensory, that they are known to be what they are through sensation. Even the earliest Buddhist texts explain that the four primary material elements are the sensory qualities solidity, fluidity, temperature and mobility; their characterization as earth, water, fire, and air, respectively, is declared an abstraction. Instead of concentrating on the fact of material existence, one observes how a physical thing is sensed, felt, perceived. Yogācāra never denies that there are sense-objects (*viśaya*, *artha*, *ālambana*, etc.), but it denies that it makes any sense to speak of cognitive objects occurring outside an act of cognition. Imagining such an occurrence is itself a cognitive act. Yogācāra is interested in why we feel compelled to so imagine.

Everything we know, conceive, imagine, or are aware of, we know through cognition, including the notion that entities might exist independent of our cognition. The mind does not create the physical world, but it produces the interpretive categories through which we know and classify the physical world. It does this so seamlessly that we mistake our interpretations for the world itself. Those interpretations which are projections of our desires and anxieties become obstructions (*āvaraṇa*) preventing us from seeing what is actually the case. In simple terms we are blinded by our own self-interests, prejudices (which means what is already prejudged) and desires.

Unenlightened cognition is an appropriative act in which cognitive objects are apprehended (*upalabdhi*). Yogācāra does not speak about subjects and objects; instead it analyses perception in terms of graspers (*grāhaka*) and what is grasped (*grāhya*).

Yogācāra at times resembles epistemological idealism, which does not claim that this or any world is constructed by mind, but rather that we are usually incapable of distinguishing our mental constructions and interpretations of the world from the world itself. This narcissism of consciousness Yogācāra calls *vijñaptimātra*, 'nothing but conscious construction'. A deceptive trick is built into the way consciousness operates at every moment. Consciousness projects and constructs a cognitive object in such a way that it disowns its own creation, pretending the object is 'out there' in order to render that object capable of being appropriated. Even while what we cognize is occurring within our act of cognition, we cognize it *as if* it were external to our consciousness. Realization of *vijñaptimātra* exposes this trick intrinsic to consciousness's workings, thereby eliminating it. When that deception is removed one's mode of cognition is no longer termed *vijñāna* (consciousness); it has become direct cognition, *jñāna*. Consciousness engages in this deceptive game of projection, dissociation and appropriation because there is no 'self'. According to Buddhism, the deepest, most pernicious erroneous view held by sentient beings is that a permanent, eternal, immutable, independent self exists. There is no such self and deep down we know that. This makes us anxious as it indicates that no self or identity endures forever. To assuage that anxiety, we attempt to construct a self, to fill the anxious void, to do something enduring. The projection of cognitive objects for appropriation is consciousness's main tool for this construction. If I own things (ideas, theories, identities, material objects), then 'I am'. If there are eternal objects that I can possess, then I too must be eternal. To undermine this desperate and erroneous appropriative grasping, Yogācāra texts such as the *Madhyāntavibhāga* say: 'Negate the object, and the self is also negated' (1: 4, 8).

Yogācārins deny the existence of external objects in two senses. In terms of conventional experience they do not deny the existence of objects such as chairs, colours and trees, but rather reject the claim that such things appear anywhere other than in consciousness. It is externality, not objects *per se*, that they challenge. They believe moreover that while such objects are admissible as conventions, in more precise terms there are no chairs, or trees. These are merely words and concepts by which we gather and interpret discrete sensations that arise moment by moment in a causal flux. These words and concepts are mental projections. The point is not to elevate consciousness, but to warn us not to be fooled by our own cognitive narcissism. Enlightened cognition is likened to a great mirror that impartially and fully reflects everything before it without attachment to what has passed nor in expectation of what might arrive.Yogācārins refuse to provide answers to the question of what sorts of objects enlightened ones cognize, apart from saying it is purified of karmic pollution (*anāśrava*), since whatever description they might offer would only be appropriated and reduced to the habitual cognitive categories that are already preventing us from seeing properly.

8 Eight types of consciousnesses

The most famous innovation of the Yogācāra school was the doctrine of eight types of consciousness. Standard Buddhism described six types of consciousness, each produced by the contact between its specific sense organ and a corresponding sense object. When a functioning eye comes into contact with a colour or shape, visual consciousness is produced. When a functioning ear comes into contact with a sound, auditory consciousness is produced. Consciousness does not create the sensory sphere, but is an effect of the interaction of a sense organ and its proper object. If an eye does not function but an object is present, visual consciousness does not arise. The same is true if a functional eye fails to encounter a visual object. Consciousness depends on sensation. There are a total of six sense organs (eye, ear, nose, mouth, body and mind) which interact with their respective sensory object domains (visual, auditory, olfactory, gustatory, tactile and mental spheres). These domains in turn amount to six distinct types of consciousness. It is worthy of note that the mind is considered another sense as it functions like the other senses with the activity of a sense organ (*manas*), its domain (*manodhātu*) and the consciousness (*manovijñāna*) resulting from the contact of organ and object. Each domain is discrete so that vision, audition and each of the remaining spheres function apart from each other. Hence the deaf can see and the blind can hear. Objects, too, are entirely specific to their domain and the same is true of consciousnesses. Visual consciousness is entirely distinct from auditory consciousssness, and so on. These eighteen components of experience, that is, six sense organs, six sense object domains and six resulting consciousnesses, were called the eighteen *dhātus*. According to standard Buddhist doctrine these eighteen exhaust the full extent of everything in the universe, or

more accurately, the sensorium.

Early Buddhist Abhidhamma, focusing on the mental and cognitive aspects of karma, expanded the three components of the mental level - mind (*manas*), mental objects (*manodhātu*) and mental consciousness (*manovijñāna*) - into a complex system of categories. The apperceptive vector in any cognitive moment was called *citta*. The objects, textures, emotional, moral and psychological tones of *citta*'s cognitions were called *caittas* (literally, 'associated with *citta*'). *Caittas* were subdivided into numerous categories that varied in different Buddhist schools. Some *caittas* are universal, that is, they are components of every cognition (for example, sensory contact, hedonic tone, attention); some are specialized, that is, they only occur in some, not all, cognitions (for example, resolve, mindfulness, meditative clarity). Some *caittas* are wholesome (for example, faith, tranquillity, lack of greed, hatred, or misconception), some unwholesome; some are mental disturbances (*kleśa*) (appropriational intent, aversion, arrogance), or secondary mental disturbances (anger, envy, guile, shamelessness) and some are karmically indeterminate (torpor, remorse).

As Abhidharma grew more complex, disputes intensified between different Buddhist schools across a range of issues. For Yogācāra the most important problems revolved around questions of causality and consciousness. To avoid the idea of a permanent self, Buddhists claimed *citta* was momentary. Since a new *citta* apperceived a new cognitive field each moment, the apparent continuity of mental states was explained by claiming each *citta*, in the moment it ceased, also caused its successor. This was fine for continuous perceptions and thought processes, but difficulties arose since Buddhists identified a number of situations in which no *citta* at all was present or operative, including certain meditative conditions explicitly defined as devoid of *citta*. If a preceding *citta* had to be temporally contiguous with its successor, how could one explain the sudden restarting of *citta* after a period of time had elapsed since the prior *citta* had ceased? Where had *citta* or its causes been residing in the interim? Analogous questions arose, such as, from where does consciousness re-emerge after deep sleep? How does consciousness begin in a new life? The various Buddhist attempts to answer these questions led to more difficulties and disputes.

Yogācārins responded by rearranging the tripartite structure of the mental level of the eighteen *dhātus* into three novel types of consciousnesses. *Manovijñāna* (empirical consciousness) became the sixth consciousness (and operated as the sixth sense organ, which previously had been the role of *manas*), surveying the cognitive content of the five senses as well as mental objects. *Manas* became the seventh consciousness, redefined as primarily obsessed with various aspects and notions of self and thus called 'defiled *manas*' (*kliṣṭamanas*). The eighth consciousness, *ālayavijñāna* (warehouse consciousness) was novel. Warehouse consciousness was defined in several ways. It is the receptacle of all seeds, storing experiences as they 'enter' until they are sent back out as new experiences, like a warehouse handles goods. It was also called *vipāka* consciousness, meaning the maturing of karmic seeds when the consequences of previous karmic actions have matured sufficiently to actualize in present experience. Seeds gradually matured in the repository consciousness until karmically ripe, when they reassert themselves as karmic consequences. *Ālayavijñāna* was also called the basic consciousness (*mūlavijñāna*) as it retains and deploys the karmic seeds that both influence and are influenced by the other seven modes of consciousness. When, for instance, the sixth consciousness is dormant (while one sleeps, or is unconscious), its seeds reside in the eighth consciousness and they restart when the conditions for their arising are present. The eighth consciousness is largely a mechanism for storing and deploying seeds of which by and large it remains unaware. *Cittas* occur as a stream in *ālayavijñāna*, but they mostly cognize the activities of the other consciousnesses, not their own seeds. In those states devoid of *citta*, the flow of *cittas* are repressed, but their seeds continue to regenerate without being noticed until they reassert a new stream of *cittas*. Warehouse consciousness acts as the pivotal karmic mechanism, but is itself karmically neutral. Each individual has its own warehouse consciousness which perdures from moment to moment and life to life. Although it is nothing more than a collection of everchanging 'seeds', it is continually changing and therefore not a permanent self. There is no universal collective mind in Yogācāra.

Enlightenment consists in bringing the eight consciousness to an end, replacing them with enlightened cognitive abilities (*jñāna*). Overturning the basis transforms the five sense consciousnesses into immediate cognitions that accomplish what needs to be done (*kṛtyānuṣṭhānajñāna*). The sixth consciousness becomes immediate cognitive mastery (*pratyavekṣaṇajñāna*), in which the general and particular characteristics of things are discerned just as they are. This discernment is considered nonconceptual (*nirvikalpajñāna*). *Manas* becomes the immediate

cognition of equality (*samatājñāna*), equalizing self and other. When the warehouse consciousness finally ceases it is replaced by the great mirror cognition (*Mahādarśajñān*) that sees and reflects things just as they are, impartially, without exclusion, prejudice, anticipation, attachment, or distortion. The grasper-grasped relation has ceased. It should be noted that all of these 'purified' cognitions engage the world in immediate and effective ways by removing the self-bias, prejudice and obstructions that previously had prevented one from perceiving beyond one's own narcissistic consciousness. When consciousness ends, true knowledge begins. One more Yogācāra innovation was the notion that a special type of cognition emerged and developed *after* enlightenment. This post-enlightenment cognition was called *pṛṣṭhalabdhajñāna*. Since enlightened cognition is nonconceptual its objects cannot be described.

9 Three self-natures

The three self-nature theory (*trisvabhāva*), which is explained in many Yogācāra texts including an independent treatise by Vasubandhu, maintains that there are three 'natures' or cognitive realms at work: the conceptually constructed realm (*parikalpitasvabhāva*) ubiquitously imputes unreal conceptions, especially permanent 'selves', into whatever it experiences, including oneself; the realm of causal dependency (*paratantrasvabhāva*), when mixed with the constructed realm, leads one to mistake impermanent occurrences in the flux of causes and conditions for fixed, permanent entities. It can be purified of these delusions by the third element, the perfectional realm (*pariniṣpannasvabhāva*), which, like the Madhyamaka notion of emptiness on which it is based, acts as an antidote (*pratipakṣa*) that 'purifies' all delusional constructions out of the causal realm. When the causally dependent realm is cleansed of all defilements it becomes 'enlightened'. These self-natures are also called the three non-self-natures, as they lack fixed, independent, true, permanent identities and therefore should not be hypostatized. The first is unreal by definition; the third is intrinsically 'empty' of self-nature. The second (which is the only 'real' one) is of an unfixed nature as it can be 'mixed' with either of the other two. Understanding the purified second nature is equivalent to understanding dependent origination (*pratītyasamutpāda*), which all schools of Buddhism accept as Buddhism's core doctrine and which tradition claims Buddha came to realize under the Bodhi tree on the night of his enlightenment (see Self, Indian theories of).

10 Five stages

Yogācāra literature is so vast that one should not be surprised to find that many of the attempts to provide detailed systems run into conflict with each other. Since it was a self-critical scholastic tradition, it was not uncommon for Yogācāra texts to discuss and criticize the positions of other Yogācāra works, as well as their more obvious opponents. Yogācāra positions on the stages of the path are diverse. The *Daśabhūmikasūtraśāstra*, a commentary on the *Ten Stages Scripture* attributed to Vasubandhu, describes the progress of the Bodhisattva path to Mahāyānic liberation in ten stages, comparable to the ten stages implicit in the Mahāyānic formulation of the ten perfections of wisdom. Asaōga's *Yogācārabhūmiśāstra* describes a series of seventeen stages. There are other formulations, such as the five-stage path that offers a useful survey of the other formulations.

The first stage is called 'provisioning' (*sambhārāvasthā*) since this is the stage at which one collects and stocks up on provisions for the journey. These provisions primarily consist of orienting oneself toward the pursuit of the path and developing the proper character, attitude and resolve to accomplish it. It begins the moment the aspiration for enlightenment arises (*bodhicitta*). The next stage is the 'experimental' stage (*prayogāvasthā*), in which one begins to experiment with correct Buddhist theories and practices, learning which of them work and which are true. One begins to suppress the grasper-grasped relation and begins to study carefully the relation between things, language and cognition. After honing one's discipline, one eventually enters the third stage, 'deepening understanding' (*prativedhāvasthā*). Some texts refer to this as the path of corrective vision (*darśanamārga*). This stage ends once one has acquired some insight into nonconceptual cognition.

Nonconceptual cognition deepens in the next stage, the path of cultivation (*bhāvanāmārga*). The grasper-grasped relation is utterly eliminated as are all cognitive obstructions. This path culminates in the overturning of the basis, or enlightenment. In the final stage (*niṣṭhāvasthā*), one abides in unexcelled complete enlightenment and engages the world through the five immediate cognitions. All one's activities and cognitions at this stage are 'postrealization'. As a Mahāyānist, from the first stage one has been devoting oneself not only to one's own attainment of enlightenment, but to the attainment of enlightenment by all sentient beings. In this stage such a pursuit becomes one's sole concern.

Ganguly, *Treatise in Thirty Verses on Mere-Consciousness*, Delhi: Motilal Banarsidass.(Xuanzang's seventh-century Chinese work, a commentary on Vasubandhu's *Triṃśikā* that drew on Sanskrit commentaries, became one of the standard expositions of Yogācāra doctrine in East Asia. La Vallée Poussin's rendition is loose, drawing on old Japanese scholarship and Chinese commentaries. He interprets the text idealistically. Tat's version is an English rendition of La Vallée Poussin's French text, minus the latter's extensive annotations. Ganguly's abridgement is convenient but frequently mistaken.)

Buddhist concept of emptiness

*'Emptiness' or 'voidness' is an expression used in Buddhist thought primarily to mark a distinction between the way things appear to be and the way they actually are, together with attendant attitudes which are held to be spiritually beneficial. It indicates a distinction between appearance and reality, where the paradigm for that distinction is 'x is empty (*śūnya*) of y', and emptiness (*śūnyatā*) is either the fact of x's being empty of y or the actual absence itself as a quality of x. It thus becomes an expression for the ultimate truth, the final way of things.* Śūnya *is also a term which can be used in the nontechnical contexts of, for example, 'The pot is empty of water'. These terms, however, are not univocal in Buddhist thought. If* x *is empty of* y, *what this means will depend upon what is substituted for* 'x' *and* 'y'. *In particular, any simplistic understanding of 'emptiness' as the Buddhist term for the Absolute, approached through a sort of* via negativa, *would be quite misleading. We should distinguish here perhaps four main uses of 'empty' and 'emptiness': (1) all sentient beings are empty of a Self or anything pertaining to a Self; (2) all things, no matter what, are empty of their own inherent or intrinsic existence because they are all relative to causes and conditions, a view particularly associated with Nāgārjuna and the Mādhyamika school of Buddhism; (3) the flow of nondual consciousness is empty of hypostasized subject-object duality, the Yogācāra view; (4) the Buddha-nature which is within all sentient beings is intrinsically and primevally empty of all defilements, a notion much debated in Tibetan Buddhism.*

1 Empty of Self or anything pertaining to Self

Conceptually and probably chronologically, one of the earliest uses of 'emptiness' (*śūnyatā*, also translated as 'voidness') in Buddhist thought is to refer to an absence specifically of an immutable and permanent 'Self' (*ātman*), a constant referent for the term 'I', the Self postulated by non-Buddhist teachers and presupposed at least implicitly even by 'the person in the street'. Grasping after 'me and mine' is held to generate an impetus towards continued rebirth and therefore suffering. Discovery of emptiness, the fact that really there is no such thing as a Self and therefore no coherent real basis for the destructive patterns of 'me and mine', leads to a letting-go of grasping which finally issues in *nirvāṇa*, the cessation of rebirth and suffering, a state sometimes itself spoken of as 'the empty'. This *nirvāṇa* is said to be 'seeing things the way they really are', that is, seeing emptiness, the absence of Self (see Nirvāṇa). Already, therefore, we can detect the use of 'emptiness' to designate the ultimate truth, that is, what is ultimately the case, how things really are. This analysis was clarified by the claim that all sentient beings are empty (*śūnya*) of a Self or anything pertaining to a Self, and really consist of ever-changing patterns of physical form, sensations, conceptions, other mental factors such as volitions, and the flow of consciousness. This list of five ever-changing 'aggregates' (*skandhas*) which are what is really there, contrasted with a Self which is really not there (that is, the aggregates are empty of a Self), was elaborated even further in the development of Abhidharma thought and eventually issued in a clear distinction between conventional truth (or reality, *satya*) and ultimate truth.

2 Emptiness in Vaibhāṣika Abhidharma

In the classical Vaibhāṣika (Sarvāstivāda) Abhidharma, all things (not just sentient beings) can be divided into primary existents (*dravyasat*) and secondary existents, conceptual constructs (*prajñaptisat*) (see Buddhism, Ābhidharmika schools of). Conceptual constructs - such as a forest, a table, a pot, the mind or a sentient being - are presented linguistically and cognitively, but are thought to be conventionalities and not ultimate realities since they are constructs out of primary existents (also known as *dharmas*), those data (such as sense-data) which are immediately presented and could not be further analysed away for fear of infinite regress and/or complete destruction. Most of these primary existents are the results of causes and are radically impermanent, indeed almost instantaneous; they form a series, a flow. They are the ultimate truths/realities. Thus from this Abhidharma perspective, although tables and sentient beings appear to be realities in their own right, really they are conceptual constructs out of more basic and ineliminable data into which they can be analysed. On the level of what is really there - 'really' in the sense of primary, ineliminable, unconstructed and therefore 'simple' reality, in other words, on the final, ultimate level, the 'ultimate truth' - there are no tables and sentient beings, for they are conceptual constructs and therefore only 'conventional truths'. Reality is empty of conceptually constructed and reified entities. The soteriological correlate of this is renunciation (an emptying), the letting-go of attachment to conceptual constructs, which as constructs are sure to perish when their causes cease to operate. Attachment to

things which by nature are perishable leads to suffering and continued rebirth. These conceptual constructs are empty of any ultimate significance, are ultimately valueless and are not worthy of attachment. In this letting-go lies liberation, final immutable freedom from suffering.

In this Vaibhāṣika distinction between primary and secondary existence there is an essential ontological aspect with axiological implications which is thought to be fundamental to enlightenment. It is arguable that this aspect, while implicit, is less central in some other Abhidharma traditions. The ontological distinction is marked by the concept of *svabhāva* ('own' or 'inherent' existence). While most primary existents are radically impermanent, the results of causes, they still exist in a different sort of way from conceptual constructs. Primary existents have 'own-existence', in contrast to secondary existents, which are simply constructs. Secondary existents are *niḥsvabhāva* - they lack (or are empty of) own-existence. If *x* is the result of the particular type of causation associated with conceptual construction then *x* is a secondary existent (*prajñaptisat*) and is empty of own-existence. If, on the other hand, *x* exists but is not the result of this particular sort of causation then it has own-existence; secondary existents are constructed out of these primary existents (*dharmas*) - primary existents inasmuch as they are not empty of own-existence.

We have seen already a move from the idea that all things are empty of a Self - that is, no matter where one looks, one cannot find anything which could be called one's Self (*ātman*), and therefore there is also nothing which is truly 'mine' - to an idea by no means identical that certain things are empty of own-existence. By an understandable but stretched sense of the word 'Self' to mean something like 'essence' ('self-identity') one could say that conceptual constructs are also empty of a Self, not just because I cannot find my Self in them but also because *qua* conceptual constructs they lack an essence. The problem here is that this could lead to an ambiguity in the term 'Self'. From the earliest Buddhist sources we have the statement that all things are empty of a Self. From a Vaibhāṣika point of view, however, while this is true it could not mean that all things are empty of own-existence, that is, that all things are secondary existents, conceptual constructs (*niḥsvabhāva*), for that would be to deny the distinction between primary and secondary existents and produce the absurdity that all things are constructs with nothing left for them to be constructed out of. That could only mean that nothing exists at all.

3 Madhyamaka critique and development

It is precisely in the claim that *all* things absolutely and without exception, no matter what, are empty that the concept of emptiness really comes to the fore in Buddhist thought. This claim is most frequently associated with the Perfection of Wisdom (*Prajñāpāramitā*) literature and its philosophical clarification and development in the Madhyamaka school, particularly the work of Nāgārjuna (*c.*150-200) and his commentators, such as Candrakīrti (*c.*600-50) (see Buddhism, Mādhyamika: India and Tibet). Here emptiness indeed means that for all *x*, *x* is empty of own-existence (*y*). The key to understanding this lies in the relationship between emptiness and causation. If *x* is the result of causes then *x* is not nonexistent, but also *x* does not have own-existence, that is, the existence of *x* is given to it by its causes, its existence is contingent and not intrinsic to it. *X* as contingent is arguably ontologically simply the intersection point of a set of causal forces - pure relativity. *X* does not have inherent existence, and the concept of *svabhāva* slides from that of own-existence in contrast to the sort of existence possessed by conceptual constructs such as forests and tables to that of inherent, noncontingent and therefore uncaused existence. Nothing which is the result of causes can have its existence inherent in itself. If something were inherently existent it would be permanently (that is, necessarily) existent. There is therefore a contradiction between causation and inherent existence. Thus in these terms even the Vaibhāṣika primary existents which are part of a causal flow become empty of inherent existence. While there may be a relative distinction between primary and secondary existents (clearly tables and suchlike can still be analysed into parts), this distinction, the follower of Madhyamaka wants to argue, ceases to have any ontological significance. In fact in the last analysis all things, no matter what, are secondary existents - they are all conceptual constructs.

For Madhyamaka, emptiness, that very absence - a complete and total absence of something which simply does not exist anywhere, a simple nonexistence (*abhāvamātra*) - of inherent existence in any *x* (because *x* is always in some sense the result of causal conditioning) is the ultimate truth in that if one analyses in order to find the fundamental simples (primary existents) out of which all things are constructed, nothing will ever be found. Analysis can dissolve away *everything* into secondary existence. Thus if we ask what exists ultimately, that is, what has the type of existence called ultimate or primary, it is found (it can be shown through analysis, commonly a sort of *reductio*

ad absurdum, Nāgārjuna would say) that nothing has that sort of existence. On the level of ultimate existence there is nothing. That absence of ultimate existence (that is, that emptiness) applied to everything (including emptiness itself) is the ultimate truth, what is found if one searches for any ultimate status for *x*. Therefore it follows not only that if *x* is causally conditioned it is empty (of inherent existence), but also that emptiness must be the very absence of inherent existence in something or other (an *x*). In terms of actuality, emptiness (the ultimate truth) requires causally conditioned existence (the conventional truth). In fact, emptiness is precisely what makes conditioned conventional reality what it is - conventional (and not ultimate) truth. If emptiness is the absence of *y* in *x* then it can be argued that there has to be an *x* - an *x* which turns out to lack *y* - in order for it to be empty of inherent existence. *X* therefore indeed exists, but as a noninherently existing, conventional entity, a conceptual construct. In order for causally conditioned existence to be causally conditioned existence it must be empty of inherent existence, that is, empty. Thus Nāgārjuna and Candrakīrti want to argue that holding all things to be empty (all things as secondary existents) does not imply the existence of nothing at all (that is, nihilism, *pace* the follower of Vaibhāṣika Abhidharma, who is unpersuaded and still finds something very strange in all of this). Rather, since emptiness is the result of causal conditioning emptiness must imply the existence of things in the causally conditioned way they actually are and must be (a point made strongly - for his opponents rather too strongly - in fifteenth-century Tibet by Tsong kha pa Blo bzang grags pa).

Emptiness, Nāgārjuna says, far from being nihilism and destroying all things (Buddhism included), is the very condition for their being. It is his opponent, who holds to a static world of inherent existences, who destroys all things. Any understanding of emptiness which does not see or show how emptiness implies existence as it actually is, Nāgārjuna would want to say, is not the correct understanding of emptiness. This includes any understanding of emptiness as itself an inherently existent Ultimate Reality. If emptiness is the pure absence of inherent existence in *x*, then without *x* there could be no emptiness. Thus just as *x* is contingent, causally conditioned, so in some sense must be its emptiness. Therefore emptiness too is empty of inherent existence. Madhyamaka here is emphatically not a form of *via negativa* leading to a pure, nonconceptual Absolute. Emptiness is empty, the Buddha is empty, enlightenment is empty - not in the sense that they are Realities beyond all mundane conceptualizing, but inasmuch as they result from some form of causal conditioning. Nevertheless, it does not follow that enlightenment, for example, ceases to be positively important (is empty in *that* sense). For Nāgārjuna, as a follower of Mahāyāna Buddhism, the welfare of sentient beings is supremely (one might say absolutely) important, but sentient beings and their welfare are still empty of inherent existence. It is because they and their welfare are empty that they can be helped. One could not change an inherently existent misery.

4 Emptiness of subject-object duality in Yogācāra

The claim that all things without exception are conceptual constructs, secondary existents (*prajñaptisat*, that is, *niḥsvabhāva*, empty of inherent existence) is a characteristically Madhyamaka claim. For the follower of Vaibhāṣika it is a patent contradiction which must make Madhyamaka an ontological nihilism, notwithstanding any protest to the contrary. To make the counterclaim that something must exist as a foundation for conceptual construction in order to avoid nihilism is to posit that at least one thing must have primary existence (*dravyasat*). To make this claim is to differ from Madhyamaka in ontologically the strongest possible way. It seems that we have this radical disagreement not only in Vaibhāṣika thought but also in a different way in Yogācāra. Yogācāra texts too ridicule as nihilism the claim that all things are conceptual constructs. Thus Yogācāra texts *must* postulate at least one thing as a primary existent, not a conceptual construct. In fact in Yogācāra thought that thing is the flow of nondual consciousness. It is a flow of consciousness which serves as the actual substratum for an erroneous bifurcation into the polarized (and linguistically reified) subjects and objects of unenlightened duality, and also as the necessary substratum for realizing that actually the flow is empty of hypostasized, reified and polarized subjects and objects. Thus from this perspective the ultimate, enlightening truth is also said to be emptiness, but here the ultimate truth is that something which really exists in the strongest possible sense - the flow of consciousness - is empty of projected subjects and objects, which do not really exist at all. As in Vaibhāṣika, we have here at least an implicit denial of an equation between causal conditioning and absence of own-existence. Since for Yogācāra too it would appear that all things including the flow of consciousness, are in some sense causally conditioned, the alternative to the denial of this equation is to hold (with Madhyamaka) the absurdity that all things are secondary existents, that is, putative nihilism (see Buddhism, Yogācāra school of §§1-4).

5 Intrinsic purity of the innate Buddha-nature

There is also in Buddhist thought a teaching of the Buddha-nature (*tathāgatagarbha*), which asserts the presence within each sentient being of something which enables that being to become a *buddha* ('awakened one'). Commonly that thing is spoken of as intrinsically pure, primevally present, and sometimes as primevally enlightened. The terms 'Mind' and even 'Self' (*ātman*) are sometimes used of it, but the Buddha-nature is also said to be empty. Often this is taken as meaning that the Buddha-nature is intrinsically and primevally empty of all the defilements of unenlightenment, which never really taint its nature. They are adventitious or contingent, which is why they can be removed. One can become enlightened because there is a sense in and a level at which there is no unenlightenment. Yet this Buddha-nature is also spoken of as not-empty, for it is not empty of all the attributes and qualities of enlightenment which are intrinsic (that is, necessary) to it and therefore never cease. The great question much debated in Tibet was whether in accepting the Buddha-nature, it should nevertheless be taken as empty of its own inherent existence (on the Madhyamaka model) or not. In one common Tibetan view (widespread also in East Asian Buddhism, but strongly opposed by others, particularly in Tibet) the Buddha-nature really does inherently and immutably exist in all sentient beings, primevally pure and enlightened, an emptiness (Mind) empty of all defilements, including the defilements of conceptuality. As nonconceptual, this emptiness cannot even be said to be 'emptiness', certainly not in the sense of '*x* is empty of *y*', which is just a relative, mundane emptiness. It can be approached only through nonconceptual gnosis (see Mi bskyod rdo rje). It is just possible that here we reach something akin to emptiness seen as an Absolute approached through a *via negativa*.

It is perhaps necessary to distinguish the foregoing philosophical discussions of emptiness in Indo-Tibetan thought from the use of 'emptiness' within the practical context of descriptions of meditation practice (for example, as an 'empty mind'). In Tibetan meditation it is common for the practitioner to reduce everything to emptiness and then generate out of that emptiness the forms of *buddhas*, or oneself in the form of a *buddha*, and so on. It would be interesting to explore further the relationship between the preceding conceptual discussions of Buddhist philosophy and purported 'nonconceptual' mental states, 'blank-minds', and so on.

Buddhist philosophy, Chinese

When Buddhism first entered China from India and Central Asia two thousand years ago, Chinese favourably disposed towards it tended to view it as a part or companion school of the native Chinese Huang-Lao Daoist tradition, a form of Daoism rooted in texts and practices attributed to Huangdi (the Yellow Emperor) and Laozi. Others, less accepting of this 'foreign' incursion from the 'barbarous' Western Countries, viewed Buddhism as an exotic and dangerous challenge to the social and ethical Chinese civil order. For several centuries, these two attitudes formed the crucible within which the Chinese understanding of Buddhism was fashioned, even as more and more missionaries arrived (predominantly from Central Asia) bringing additional texts, concepts, rituals, meditative disciplines and other practices. Buddhists and Daoists borrowed ideas, terminology, disciplines, cosmologies, institutional structures, literary genres and soteric models from each other, sometimes so profusely that today it can be difficult if not impossible at times to determine who was first to introduce a certain idea. Simultaneously, polemical and political attacks from hostile Chinese quarters forced Buddhists to respond with apologia and ultimately reshape Buddhism into something the Chinese would find not only inoffensive, but attractive.

In the fifth century AD, Buddhism began to extricate itself from its quasi-Daoist pigeonhole by clarifying definitive differences between Buddhist and Daoist thought, shedding Daoist vocabulary and literary styles while developing new distinctively Buddhist terminology and genres. Curiously, despite the fact that Mahāyāna *Buddhism had few adherents in Central Asia and was outnumbered by other Buddhist schools in India as well, in China* Mahāyāna *became the dominant form of Buddhism, so much so that few pejoratives were as stinging to a fellow Buddhist as labelling him '*Hīnayāna*' (literally 'Little Vehicle,' a polemical term for non-*Mahāyānic *forms of Buddhism). By the sixth century, the Chinese had been introduced to a vast array of Buddhist theories and practices representing a wide range of Indian Buddhist schools. As the Chinese struggled to master these doctrines it became evident that, despite the fact that these schools were all supposed to express the One Dharma (Buddha's Teaching), their teachings were not homogenous, and were frequently incommensurate.*

By the end of the sixth century, the most pressing issue facing Chinese Buddhists was how to harmonize the disparities between the various teachings. Responses to this issue produced the Sinitic Mahāyāna *schools, that is, Buddhist schools that originated in China rather than India. The four Sinitic schools are Tiantai, Huayan, Chan and Pure Land (Jingtu). Issues these schools share in common include Buddha-nature, mind, emptiness,* tathāgatagarbha*, expedient means (*upāya*), overcoming birth and death (*saṃsāra*), and enlightenment.*

1 Historical overview

The development of Chinese Buddhist philosophy can be divided roughly into four periods: (1) the early introduction of Indian and Central Asian Buddhism (first-fourth centuries AD); (2) the formative development of Chinese versions of Indian and Central Asian Schools (fifth-seventh centuries); (3) the emergence of distinctively Sinitic Buddhist schools (seventh-twelfth centuries); and (4) the continuance of Chinese Buddhism into the present day (thirteenth century onwards).

From the fourth through the seventh centuries, Buddhists periodically realized that the positions being engendered in China were at variance with their Indian antecedents, and attempted to correct the problem, either through the introduction of additional translations or by clarifying differences between Buddhist and native Chinese ideas. By the eighth century, the Chinese had apparently become satisfied with the types of Buddhism they had developed, since from then on they lost interest in Indian commentaries and treatises and instead turned their attention toward Chinese commentaries on the Buddhist scriptures - such as the *Lotus Sutra* and *Huayan Sutra* - that had assumed importance for Chinese Buddhist traditions. Moreover, even though missionaries continued to arrive in China and new translations continued to be produced through the thirteenth century, none of the significant developments in Indian Buddhism (such as Buddhist syllogistic logic) from the seventh century onwards had any lasting impact on Chinese Buddhism, and many important texts and thinkers (for example, Dharmakīrti, Candrakīrti, Śāntarakṣita) remained virtually unknown in East Asia until modern times (see Buddhist philosophy, Indian).

2 Earliest developments

The first undisputed reference to Buddhism in China is an edict by Emperor Ming to Liu Ying, king of Qu, in the year AD 65, which mentions sacrifices performed by the king to Buddha as well as favourable treatment for Buddhist monks and laymen; the edict also identifies King Liu Ying as a follower of Huang-Lao Daoism. For the next few centuries, the Chinese continued to view Buddhist texts and practices as a part of or supplement to Daoism. Buddhism seemed to share important issues with the types of Daoism practised in this period, including the metaphysical primacy of emptiness, meditation techniques, dietary and behavioural disciplines, afterlife theories connected to moral and behavioural discipline, expansive pantheons and cosmologies, striving for the soteriological transformation of the ordinary human condition, rigorous and subtle intellectual traditions, and magical and yogic powers. These affinities, however, were more apparent than real, since the Buddhist approaches to these issues usually differed sharply from their Daoist counterparts, though Buddhists did not assert their distinctiveness until the fifth century.

Buddhist monks and businessmen representing a variety of Buddhist schools and disciplines continued to arrive in China, establishing Buddhist communities in Loyang and elsewhere. It took several centuries for the Chinese to notice how disparate the various forms of Buddhism really were. Initially the Chinese were most interested in Buddhist meditation techniques, including chanting and visualizations, which they adopted as supplements to Daoistic techniques. Daoism held out the promise that one could become a sage or perfected person, or even an immortal, but the exact details of how to accomplish this transformation remained elusive and vague. In comparison to many of the Daoist texts which were esoteric, hard to find, and frequently obscure in presentation, Buddhist texts seemed systematic and detailed, providing step-by-step procedures for practitioners.

Along with meditation manuals, the earliest Buddhist texts to become popular in China were Āvadana materials (legends of the Buddha and Buddhist heroes) and the Perfection of Wisdom Scriptures (*Prajñāpāramitā Sutras*). About half a dozen schools formed around varying interpretations of the Perfection of Wisdom Scriptures, mixing ideas found in these and other Buddhist texts with concepts prominent among Chinese intelligentsia. One Prajñāschool, called the Original Nothingness school (*Benwu*), adopted a neo-Daoist cosmology: everything has emerged from a primordial, original emptiness, and everything returns to that void. This was a thorough misconstrual of Buddhist emptiness (see Buddhist concept of emptiness). Another school, called the Mind Empty school (*Xinwu*), equated the primordial Nothing with the nature of mind (see Zhi Dun). Each of the Prajñāschools managed either to promote a metaphysical substantialized emptiness which they opposed to form, or smuggle an eternal self or spirit into their formulations, despite Buddhism's emphatic rejection of the notion of permanent selfhood.

Dao'an (AD 312-85) criticized the Prajñāschools, challenging their faithfulness to authentic Buddhist positions as well as the translation methodologies behind the texts they and other Chinese Buddhists had come to rely on. In particular, he criticized the practice of 'matching the meanings' (*geyi*), by which translators seeking Chinese equivalents for Indian Buddhist technical terms and concepts borrowed heavily from Daoist literature. This 'matching of meanings' was a mixed blessing. Packaging Buddhist ideas in familiar terms made them amenable and understandable, but the 'matches' were often less than perfect, distorting or misrepresenting Buddhism. For instance, early translators chose a well-known Daoist and Confucian term, *wuwei* (nondeliberative activity), to translate *nirvāṇa*. Arguably, *wuwei* and *nirvāṇa* represent the teloi of Daoism and Buddhism, respectively, but it is not obvious that they denote the same telos (see Daoist philosophy §6; Nirvāṇa). Later, to emphasize the uniqueness of Buddhist *nirvāṇa*, translators dropped *wuwei* in favour of a transliteration, *niepan*. *Wuwei* was retained to render another important Buddhist notion, *asaṃskṛta* (unconditioned). The semantic connotations of Daoist *wuwei* and Buddhist *wuwei*, while possibly overlapping in some senses, were nonetheless quite distinct: for Daoists it meant a mode of interacting effortlessly and naturally with the world, while for Buddhists it denoted something unaffected by causes and conditions, that neither arose nor ceased. Chinese readers inevitably came to conflate the semantic ranges of such terms, which over the centuries led to some distinctively Chinese Buddhist concepts. After Dao'an, Chinese Buddhism asserted its distinctiveness from native Chinese traditions and Buddhists adopted increasingly critical hermeneutic approaches to translation.

3 Indian transplants: Madhyamaka and *icchantikas*

In the critical environment that followed Dao'an, two sets of events moved Chinese Buddhism in new directions. First, Kumārajīva, a Mahāyāna Buddhist from Kucha in Central Asia, was brought to Changan, the Chinese

capital, in 401. Under the auspices of the ruler, he began translating numerous important works with the help of hundreds of assistants, including some of the brightest minds of his day. Some works, such as the *Lotus Sutra*, *Vimalakīrti Sutra* and *Diamond Sutra*, quickly became popular classics. He also introduced the emptiness philosophy of Nāgārjuna's Madhyamaka thought (see Buddhism, Mādhyamika: India and Tibet; Nāgārjuna), which in China came to be called the Three Treatise School (Sanlun) after the three Madhyamaka texts he translated: the *Madhyamaka-kārikās*, the *Twelve Gate Treatise* and Āryadeva's *One Hundred Verse Treatise*. In a series of famous letters exchanged with a disciple of Dao'an, Huiyuan (344-416), who had mastered most of the Buddhist theory and practice known in China up to that time, Kumārajīva attacked the shortcomings of the current Chinese Buddhist theories and argued persuasively for the preeminence of Madhyamaka in matters of both theory and practice. His leading disciple, Seng Zhao (384-414), further popularized Madhyamaka thought by packaging it in an exquisite adoption of the literary style of Laozi (see Daodejing) and Zhuangzi, both of whom were extremely popular amongst literati at that time. Sanlun thought continued to spread through the fifth through seventh centuries, greatly influencing other Buddhist schools. After Jizang (549-623), who attempted to synthesize Madhyamakan emptiness with the Buddha-nature and *tathāgatagarbha* thought gaining prominence at his time, the Sanlun school declined, its most important ideas absorbed by other schools.

Second, in 418 Faxian (the first Chinese monk successfully to return to China with scriptures from pilgrimage to India) and Buddhabhadra produced a partial translation of the Mahāyāna *Nirvāṇa Sutra*. One of the topics it discusses is the *icchantika*, incorrigible beings lacking the requisites for achieving enlightenment. Daosheng (*c*.360-434), a disciple of Huiyuan, convinced that all beings, including *icchantikas*, must possess Buddha-nature and hence are capable of enlightenment, insisted that the *Nirvāṇa Sutra* be understood in that light. Since that violated the obvious meaning of the text, Daosheng was unanimously rebuked, whereupon he left the capital in disgrace. In AD 421, a new translation by Dharmakṣema of the *Nirvāṇa Sutra* based on a Central Asian original appeared containing sections absent from the previous version. The twenty-third chapter of Dharmakṣema's version contained passages declaring that Buddha-nature was indeed universal, and that even *icchantikas* possessed it and could thus reach the goal. Daosheng's detractors in the capital were humbled, suddenly impressed at his prescience. The lesson was never forgotten, so that two centuries later, when Xuan Zang (600-64) translated Indian texts that once again declared that *icchantikas* lacked the requisite qualities to attain enlightenment, his school was attacked from all quarters as promoting a less than 'Mahāyānic' doctrine. However, it should be noted that there is no clear precedent or term in Indian Buddhism for 'Buddha-nature'; the notion probably either arose in China through a certain degree of license taken by translators when rendering terms like *buddhatva* ('Buddhahood', an accomplishment, not a primordial ontological ground), or it developed from nascent forms of the theory possibly constructed in Central Asia. However, from this moment on, Buddha-nature become one of the foundational tenets of virtually all forms of East Asian Buddhism.

4 Indian transplants: *tathāgatagarbha* and Yogācāra

A dispute at the start of the sixth century presaged a conflict that would take the Chinese Buddhists more than two centuries to settle. Two Indian monks collaborated on a translation of Vasubandhu's *Daśabhūmikasūutra śāstra (Treatise on the Ten Stages Sutra; in Chinese, Shidijing lun, or Dilun for short)*. The *Dilun* described the ten stages through which a *bodhisattva* proceeded on the way to *nirvāṇa*, and Vasubandhu's exposition of it highlighted aspects most in accord with the tenets of the Yogācāra school (see Buddhism, Yogācāra school of; Vasubandhu). While translating, an irreconcilable difference of interpretation broke out between the two translators, Bodhiruci and Ratnamati. Bodhiruci's reading followed a relatively orthodox Yogācāra line, while Ratnamati's interpretation leaned heavily toward a Buddhist ideology only beginning to receive attention in China, *tathāgatagarbha* thought. Bodhiruci went on to translate roughly forty additional texts, and was later embraced by both the Huayan and Pure Land traditions as one of their early influences (see §§8, 10). Ratnamati later collaborated with several other translators on a number of other texts. Both sides attempted to ground their positions on interpretations of key texts, especially the *Dilun*. The Yogācāra versus Yogācāra-*tathāgatagarbha* conflict became one of the critical debates amongst sixth and seventh century Chinese Buddhists.

Yogācāra focused on the mind and distinguished eight types of consciousness: five sensory consciousnesses; an empirical organizer of sensory data (*mano-vijñāna*); a self-absorbed, appropriative consciousness (*manas*); and the eighth, a warehouse consciousness (*ālaya-vijñāna*) that retained the karmic impressions of past experiences and coloured new experiences on the basis of that previous conditioning. The eighth consciousness was also the

fundamental consciousness. Each individual is constituted by the karmic stream of one's own *ālaya-vijñāna*, that is, one's karmic conditioning. Since, like a stream, the *ālaya-vijñāna* is reconfigured each moment in response to constantly changing conditions, it is not a permanent self, although, being nothing more than a sequential chain of causes and effects, it provides sufficient stability for an individual to maintain a sense of continuity. According to classical Yogācāra texts, the mind (that is, *ālaya-vijñāna* and the mental events associated with it) is the problem, and enlightenment results from bringing this consciousness to an end, replacing it with the Great Mirror Cognition (*ādarśa-jñāna*); instead of discriminating consciousness, one has direct immediate cognition of things just as they are, as impartially and comprehensively as a mirror. This type of enlightenment occurs during the eighth stage according to the *Dilun* and other texts.

The term *tathāgatagarbha* (in Chinese, *rulaizang*) derives from two words: *tathāgata* (Chinese, *rulai*) is an epithet of the Buddha, meaning either 'thus come' or 'thus gone'; *garbha* means embryo, womb or matrix, and was translated into Chinese as *zang*, meaning 'repository'. In its earliest appearances in Buddhist texts, *tathāgatagarbha* (repository of buddhahood) signified the inherent capacity of humans (and sometimes other sentient beings) to achieve buddhahood. Over time the concept expanded and came to signify the original pristine pure ontological Buddha-ness intrinsic in all things, a pure nature that is obscured or covered over by defilements (Sanskrit, *kleśa*; Chinese *fannao*), that is, mental, cognitive, psychological, moral and emotional obstructions. It was treated as a synonym for Buddha-nature, though Buddha-nature dynamically understood as engaged in a struggle against defilements and impurities. In Chinese Buddhism especially, the soteriological goal consisted in a return to or recovering of that original nature by overcoming or eliminating the defilements. The battle between the pure and impure, light and dark, enlightenment and ignorance, good and evil and so on, took on such epic proportions in Chinese Buddhist literature that some scholars have compared it to Zoroastrian or Manichean themes, though evidence for the influence of those religions on Buddhist thought has been more suggestive than definitive (see Manicheism; Zoroastrianism).

In their classical formulations the *ālaya-vijñāna* and *tathāgatagarbha* were distinct items differing from each other in important ways - for instance, enlightenment entailed bringing the *ālaya-vijñāna* to an end, while it meant actualizing the *tathāgatagarbha*; the *ālaya-vijñāna* functioned as the karmic mechanism *par excellence*, while *tathāgatagarbha* was considered the antipode to all karmic defilements. Nonetheless some Buddhist texts, such as the *Laōkāvatāra Sūtra*, conflated the two. Those identifying the two argued that the *ālaya-vijñāna*, like *tathāgatagarbha*, was pure and its purity became permanently established after enlightenment. Those opposing the conflation countered that the *ālaya-vijñāna* was itself defiled and needed to be eliminated in order to reach enlightenment. For the conflators, *tathāgatagarbha* was identified with Buddha-nature and with mind (*xin*) (see Xin). Mind was considered pure, eternal, and the ontological ground of reality (*Dharma-dhātu*), while defiled thought-instants (*nian*) that engaged in delusionary false discriminations had to be eliminated. Once *nian* were eliminated, the true, pure nature of the mind would brilliantly shine forth, like the sun coming out from behind the clouds.

A third view was added when Paramārtha, another Indian translator with his own unique interpretation of Yogācāra, arrived in the middle of the sixth century. For his followers the most important of his translations was the *She dasheng lun* (Sanskrit title, *Mahāyānasaṃgraha*), or *Shelun*, a quasi-systematic exposition of Yogācāra theory by one its founders, Asaōga. In some of his translations he added a ninth consciousness beyond the usual eight, a 'pure consciousness' that would pervade unhindered once the defiled *ālaya-vijñāna* was destroyed. His translations, which sometimes took liberties with the Sanskrit originals, offered a more sophisticated version of the conflation theory.

5 The *Awakening of Faith in Mahāyāna*

These debates and their ramifications dominated Chinese Buddhist thought in the sixth century. On one side was a substantialistic nondual metaphysic whose eternalistic ground was variously called Buddha-nature, mind, *tathāgatagarbha*, *Dharma-dhātu* and suchness (*tathatā*; in Chinese, *rulai*). On the other side was an anti-substantialist critique that eschewed any form of metaphysical reification, emphasizing emptiness as the absence of permanent selfhood or independent essence in anything. To the anti-substantialists the *tathāgatagarbha* position sounded dangerously close to the notion of eternalistic, reified selfhood that Buddha had rejected. Mahāyāna texts had declared that there were four conceptual perversions or reversals behind human

delusion: (1) seeing a self in what lacks self; (2) seeing permanence in the impermanent; (3) seeing happiness in what is suffering; and (4) seeing purity in the impure. Yet starting with the earliest *tathāgatagarbha* texts - such as *The Lion's Roar of Queen Śrīmāla* - *tathāgatagarbha* was brazenly defined as 'self, eternal, happiness and pure'. In the face of these and other disparities, the Chinese asked how, if there is only one *dharma* (teaching), there can be such incommensurate variety.

The *Awakening of Faith in Mahāyāna*, a Chinese composition purporting to be a translation by Paramārtha of an Indian text, became an instant classic by offering a masterly synthesis of Buddhist teachings that seemed to resolve many of the disparities (see Awakening of Faith in Mahāyāna). Its central tenet is that there is one Mind that has two aspects. One aspect is suchness and the other is *saṃsāra*, the cycle of birth and death, arising and ceasing. Suchness also has two aspects, emptiness and non-empty. Emptiness in this text means suchness is beyond predication, neither one nor many, neither the same nor different. Non-empty means it is endowed with all the marvellous qualities and merits of a Buddha, 'as numerous as the sands along the banks of the Ganges'. The link between suchness and the realm of arising and ceasing is *tathāgatagarbha* in association with the *ālaya-vijñāna*. Ignorance, enlightenment and pursuit of the Path are all on the arising and ceasing side.

In a pivotal passage that would become foundational for most forms of Chinese, Korean and Japanese Buddhism, the *Awakening of Faith in Mahāyāna* states that on the basis of Original Enlightenment there is non-enlightenment; on the basis of non-enlightenment there is initial enlightenment; and on the basis of initial enlightenment there is final enlightenment, which is the full realization of original enlightenment. Beyond the problem of theodicy that it raises (the text does not offer a clear explanation for why or how non-enlightenment arises), several issues emerge. First, suddenly there is no longer simply one enlightenment that is achieved at the culmination of a spiritual path, but instead several enlightenments, one of which (original enlightenment) precedes even entering the path. What the text calls initial enlightenment had been termed *bodhicitta* or *cittotpāda* (arousing the aspiration for enlightenment) in previous Buddhist literature. Arousing this aspiration is what the title *Awakening of Faith in Mahāyāna* signifies. Now, rather than marking a singular, ultimate achievement, the term 'enlightenment' referred to several things: an atemporal originary ground upon which everything else plays out, including non-enlightenment; one's initial resolve or insight that leads one to begin pursuing the path; the final achievement at the end of the path, an achievement that is not only anticlimactic, but is little more than an unravelling of the intersection of original and initial enlightenment. This reinforced the conviction of Chinese Buddhists that the conflationist approach, with its emphasis on Buddha-nature or mind as ground, was the correct view.

One of the first to recognize the importance of the *Awakening of Faith in Mahāyāna* was a Korean monk named Wônhyo. He wrote a commentary on the text that reached China, where it influenced Fazang, a foundational thinker of the Huayan school, who used its ideas as a major cornerstone for his thinking. Since the *Dilun*, originally an independent text, had eventually been incorporated into the *Huayan Sutra* as one of its chapters, and that scripture became the basic text of the Huayan school, many of the issues that had emerged from the debates on the *Dilun* were absorbed and reconfigured by the Huayan thinkers. In a sense, it was ultimately Ratnamati's interpretation that prevailed after two centuries of debate. The *Awakening of Faith in Mahāyāna* became pivotal for Chinese Buddhism, is still one of the foundations of Korean Buddhism and, though it has been eclipsed in Japan by other texts such as the *Lotus Sutra*, many of its ideas, such as the idea of original enlightenment (*hongaku*), still exert a profound influence. This text set the stage for the development of distinctively East Asian forms of Buddhism.

6 The Chinese Buddhist Schools

Although the ideas and literature of many different forms of Buddhism reached China - including Sarvāstivāda, Mahīśāsika, Saṃmitīya, Dharmaguptaka, Sautrāntika and others - only Madhyamaka and Yogācāra developed Chinese schools and lineages. Madhyamaka disappeared as an independent school after Jizang, but its influence and the preeminence of Nāgārjuna never abated. The sixth century was basically a battleground of competing Yogācāric theories.

In the seventh century the famous Chinese pilgrim Xuanzang (600-64) spent sixteen years travelling in Central Asia and India. He returned to China in 645 and translated seventy-four works. Due in part to his accomplishments as a traveller and translator, and in part to the eminent favour bestowed on him by the Chinese emperor upon his

return, Xuanzang became the most prominent East Asian Buddhist of his generation. He promoted an orthodox form of Yogācāra as it was then being practised in India, and students flocked to him from Japan and Korea as well as China. Not everyone was enamoured of the Buddhist ideology he had brought back. Zhiyan (602-68), who would later be considered one of the patriarchs of the Huayan school, was openly critical of Xuanzang's teachings, and Fazang had joined Xuanzang's translation committee late in Xuanzang's life, only to quit in disgust at Xuanzang's 'distorted' views. While in India, Xuanzang had discovered how far Chinese Buddhism had deviated from its Indian source, and his translations and teachings were deliberate attempts to bring Chinese Buddhism back in line with Indian teachings. The ideas he opposed (primarily but not exclusively those that had been promoted by Paramārtha's school) were already deeply entrenched in Chinese Buddhist thinking. While he was alive his pre-eminence made him unassailable, but once he died his detractors attacked his successor, Kuiji (632-82), and successfully returned Chinese and East Asian Buddhism to the trajectory established by the conflationists. (Wônch'ūk, a Korean student of Xuanzang, was a rival of Kuiji who fared better with the revivalists since he attempted to harmonize the teachings of Paramārtha and Xuanzang.) The underlying ideology of this resurgence, which reached its intellectual apex over the course of the Tang and Song Dynasties (sixth-twelfth centuries), was neatly summarized by the label '*dharma*-nature' (*faxing*), that is, the metaphysical ground of Buddha-nature *qua dharma*-*dhātu qua* mind-nature *qua tathāgatagarbha*. Fazang argued that orthodox Yogācāra only understood *dharma* characteristics (*faxiang*), that is, phenomenal appearances, but not the deeper underlying metaphysical reality, '*dharma*-nature'. After Fazang, all the Sinitic Buddhist schools considered themselves *dharma*-nature schools; Yogācāra and sometimes Sanlun were considered merely *dharma* characteristics schools.

Four *dharma*-nature schools emerged. Each school eventually compiled a list of its patriarchs through whom its teachings were believed to have been transmitted. Modern scholarship in Japan and the West has shown that these lineages were usually forged long after the fact, and frequently were erroneous or distorted the actual historical events. For instance, while Huiyuan was an active promoter of the Sarvāstivādin teachings introduced during his time by Sanghadeva and Buddhabhadra, the later Pure Land schools dubbed him their initial Chinese patriarch on the basis of his alleged participation in Amitābha rituals, allegations that were probably first concocted during the Tang Dynasty. Similarly, the lineage of six Chan patriarchs from Bodhidharma to Huineng is unlikely; the Huayan lineage (Du Shun to Zhiyan to Fazang to Chengguan) was largely an invention of the 'fourth' patriarch, Chengguan: his predecessors were unaware that they were starting a new lineage and rather thought that they were reviving the true old-time religion of Paramārtha. It was also during the Tang dynasty that Tantra briefly passed through China, from whence it was brought to Japan and became firmly established as the Shingon school.

7 The Chinese Buddhist Schools: Tiantai

Though considered its third patriarch, the intellectual founder of the Tiantai school was Zhiyi (538-97). Responding to the proliferation of different Buddhist theories and practices, he proposed a masterly, detailed synthesis that definitively set Chinese Buddhism in its own direction. To the question of why there was an abundance of incommensurate teachings despite the fact that there could only be one *dharma*, Zhiyi replied that all the different vehicles of Buddhism were ultimately one vehicle (*eka*-*yāna*), an idea championed by the *Lotus Sutra*. More specifically, he offered a *panjiao*, or classificatory scheme of teachings, to explain the discrepancies. His *panjiao* was complex and brilliant (and further refined much later by Chegwan, a Korean Tiantai monk in China), but in simple form it can be summarized as follows.

Buddha offered different teachings to different audiences based on the differing capacities of audiences to comprehend what he preached. According to the basic narrative, which became the way all Chinese Buddhists thought of Buddha's teaching career, upon reaching enlightenment under the Bodhi Tree, Buddha, enraptured by his new vision, began to describe that vision in immediate and exuberant terms. This became the *Huayan Sutra*. (In reality, this 'sutra' is a collection of disparate texts - none probably composed earlier than the third century AD - that were gradually compiled together over several more centuries.) When he finished (it took two or three weeks) he realized that no one had understood the sublime meaning of his words, and immediately began to teach a simplified, preparatory teaching which became the Hīnayāna teachings. After twenty years of preparatory teachings, he introduced the next level, beginners' Mahāyāna (basically Yogācāra and Madhyamaka). In the next period he introduced advanced Mahāyāna (the *Vaipūlya Sutras*), and finally in his last days, having now trained many advanced students, he preached the *Lotus Sutra* and the *Nirvāṇa Sutra*. In effect this *panjiao* asserts that the two highest sutras offered by Buddha were the *Huayan* and *Lotus*; but whereas the *Huayan* was too sublime to be

understood by any save the most advanced or enlightened students, the *Lotus* represented Buddha's most comprehensive, cumulative, mature and accessible teaching, every bit as sublime as the *Huayan*, but now presented in a pedagogically effective manner. For that reason, Zhiyi made the *Lotus Sutra* the foundational text of Tiantai. As for the remaining teachings, as the *Lotus* itself explains, different 'truths' can be superseded once they have served their task of raising one to a higher level where a different 'truth' holds sway. Buddhism, according to the *Lotus* and Tiantai, is a system of expedient means (*upāya*) leading one with partial truths to ever greater, more comprehensive truths. Tiantai teachings are 'Round Teachings', meaning that they encircle or encompass everything and, lacking sharp edges, are therefore Perfect. Other forms of Buddhism are not 'wrong', but are only partial visions of the One Vehicle that Tiantai most perfectly and completely embodies.

Zhiyi, based on an exhaustive exposition of a verse from Nāgārjuna's *Madhyamaka-kārikās* (24: 18), devised a theory of three truths: provisional, empty and middle. The first two are mirror images of each other, two ways of speaking about causes and conditions. A table can provisionally be called a table, since its perceptible form has arisen through causes and conditions, and it only exists provisionally on the basis of those temporary conditions. The table is empty because, being the product of causes and conditions, it lacks its own intrinsic, independent nature. It is 'middle' because neither the provisional nor the empty truth about the table fully captures its reality. It is both provisional and empty, and simultaneously neither provisional nor empty. As Zhiyi put it, 'wondrous being is identical to true emptiness'. Zhiyi sought many ways to express the nondual middle truth. For instance, rejecting the obvious dualism of the distinction most of his contemporaries made between pure mind (*xin*) and deluded thought-instants (*nian*), Zhiyi declared that every deluded thought-instant was identical to three thousand chilicosms. The details of the formulas he used to arrive at the number three thousand is less important than fact that it is meant to encompass the full extent of Buddhist cosmological metaphysics. The whole universe in all its dimensions is entailed in every moment of thought. Rather than attempt to eliminate deluded thinking to reach a purified mind, Zhiyi claimed each moment of deluded thinking was already identical to enlightenment. One merely has to see the mind and its operations as they are. This idea was later taken over by the Chan (Zen) school, which expressed it in sayings such as 'Zen mind is everyday mind'.

The middle approach is also evident in the Tiantai notion of three gates, or three methods of access to enlightened vision: the Buddha-gate, the gate of sentient beings and the mind-gate. The Buddha-gate was considered too difficult, too abstruse, too remote; one had to be a Buddha already to fully comprehend it. The sentient-being gate (the various methods taught and practised by any sort of being) was also too difficult because there are too many different types of sentient beings all with their own types of delusions, so that this gate is a confusing cacophony of disparate methods, some which may not be appropriate for some beings. The easiest and hence preferable gate was the mind-gate. It is no more remote than this very moment of cognition, its diversity can be observed in every thought-instant, and nothing could ever be more appropriately suited for an individual than to observe one's own mind. Tiantai cultivated many types of meditation for that purpose.

8 The Chinese Buddhist Schools: Huayan

Drawing on a *panjiao* similar to that of Zhiyi, the Huayan school chose the *Huayan Sutra* (Sanskrit title *Avataṃsaka Sutra*, Chinese *Huayan jing*) for its foundational scripture. What immediately differentiates Huayan from typically Indian approaches is that instead of concentrating on a diagnosis of the human problem, and exhorting and prescribing solutions for it, Huayan immediately begins from the point of view of enlightenment. In other words, its discourse represents a nirvanic perspective rather than a samsaric perspective. Instead of detailing the steps that would lead one from ignorance to enlightenment, Huayan immediately endeavours to describe how everything looks through enlightened eyes.

Like Tiantai, Huayan offers a totalistic, encompassing 'round' view. A lived world as constituted through a form of life experience is called a *dharma-dhātu*. Chengguan, the 'fourth' Huayan patriarch, described four types of *dharma-dhātus*, each successively encompassing its predecessors. The first is *shi*, which means 'event', 'affair' or 'thing'. This is the realm where things are experienced as discrete individual items. The second is called *li* (principle), which in Chinese usage usually implies the principal metaphysical order that subtends events as well as the rational principles that explicate that order. Often *li* is used by Buddhists as a synonym for emptiness. The first sustained analysis based on the relation of *li* and *shi* was undertaken by the Korean monk Wônhyo in his commentary on the *Awakening of Faith in Mahāyāna*, which influenced early Huayan thinkers like Fazang. The

li-shi model went on to become an important analytic tool for all sorts of East Asian philosophers, not just Buddhists. In the realm of *li*, one clearly sees the principles that relate *shi* to each other, but the principles are more important than the individual events. In the third realm, one sees the mutual interpenetration or 'non-obstruction' of *li* and *shi* (*lishi wu'ai*). Rather than seeing events while being oblivious to principle, or concentrating on principle while ignoring events, in this realm events are seen as instantiations of principle, and principle is nothing more than the order by which events relate to each other.

In the fourth and culminating *dharma-dhātu*, one sees the mutual interpenetration and non-obstruction of all events (*shishi wu'ai*). In this realm, everything is causally related to everything else. Huayan illustrates this with the image of Indra's net, a vast net that encompasses the universe. A special jewel is found at the intersection of every horizontal and vertical weave in the net, special because each jewel reflects every other jewel in the net, so that looking into any one jewel, one sees them all. Every event or thing can disclose the whole universe because all mutually interpenetrate each other without barriers or obstruction.

This form of nondualism is not monistic because *shishi wu'ai* does not obliterate the distinctions between things, but rather insists that everything is connected to everything else *without* losing distinctiveness. Identity and difference, in this view, are merely two sides of the same coin, which, though a single coin, still has two distinct sides that should not be confused for each other. Mutual interpenetration is temporal as well as spatial; past, present and future mutually interpenetrate. Hence according to Huayan, to enter the path towards final enlightenment is, in an important sense, to have already arrived at that destination.

9 The Chinese Buddhist Schools: Chan

Better known in the West by its Japanese pronunciation, Zen, Chan emerged as a reaction against the increasing scholastic complexities of the Tiantai and Huayan schools and their voluminous, hairsplitting literature, which, some Chan practitioners believed, could be more of an obstacle than an aid to enlightenment. The Pāli term for meditative absorption, *jhāna* (Sanskrit, *dhyāna*), was transliterated into Chinese as *Channa*, and then shortened to *Chan*. Until the early Tang Dynasty, *chanshi* (Chan master) meant a monk adept at meditation, though it did not specify what sorts of meditation he was practising. Some monks were called *dharma* masters (*fashi*), some were called scriptural masters (*zangshi*), some were called disciplinary masters (*lushi*) and some were meditation masters. These titles could be applied to a monk (or nun) of any school, since they denoted one's methodological focus rather than one's ideological leanings.

Chan begins to denote a specific doctrinal and meditative ideology around the time of Huineng (638-713). Although Chan tradition describes a transmission by five patriarchs culminating in Huineng as the sixth patriarch, as noted above, that transmission is more fiction than fact. Huineng's followers established the Southern School of Chan, which unleashed a polemical tirade against the Northern School. Since the Northern School disappeared about a thousand years ago, our only source of information on these schools was the prejudiced accounts of the Southern School, until the discovery at Dunhuang early this century of Northern School documents. We now know that many different versions of lineage histories were circulated, and, more importantly, that the positions attributed to the Northerners by their Southern rivals were grossly inaccurate and unfair. In fact, the Northern School had initially been the more successful of the two, but its success led to its ultimate ruin, since its growing dependence on Imperial patronage made it a vulnerable target during times of Imperial persecution of Buddhism. The Southern School, because it had taken root in remote areas less affected by actions of the Central government, survived the persecutions relatively intact.

Huineng is depicted in the *Platform Sutra* (authored by his leading follower and promoter, Shenhui) as an illiterate seller of firewood who experiences sudden enlightenment while overhearing someone reciting the *Diamond Sutra*. He joins a monastery where, without any official training in scriptures or meditation, he demonstrates that his enlightenment is more profound than all the monks who had been practising for years. Hence sudden enlightenment is one of the main tenets of the *Platform Sutra* (and subsequently for all forms of Chan). Another is 'direct pointing at mind', which, similar to the Tiantai approach, means that what is important is to observe one's own mind, to recognize that the nature of one's mind is Buddha-nature itself (see Platform Sutra).

While some Buddhists had argued that the goal was wisdom, and meditation was merely a means to that goal, Huineng argued for the inseparability of meditation and wisdom. Using an analytic device probably introduced by

the so-called neo-Daoist Wang Bi (226-49), the *tiyong* model (see Ti and yong), Huineng claimed that meditation is the essence (*ti*) of wisdom, and wisdom is the function (*yong*) of meditation. Wisdom does not produce meditation, nor does meditation produce wisdom; nor are meditation and wisdom different from each other. He drew an analogy to a lamp: the lamp is the *ti*, while its light is the *yong*. Wherever there is a (lit) lamp, there is light; wherever there is lamplight, there is a lamp. Lamp and light are different in name but identical in substance (*ti*), hence nondual.

Huineng's style of Chan was still sober, calm, rational, and rooted in commonly accepted Buddhist tenets. New and more radical elements were soon incorporated into Chan, some iconoclastically renouncing meditation and practice as well as scholasticism, and others trying earnestly to work out a rational system by which Chan could be syncretized with the other schools. Zongmi (780-841) considered a patriarch of both the Chan and Huayan schools, attempted just such a synthesis, but his sober approach was soon overshadowed in China by more abrupt, startling forms of Chan.

Of the 'Five Houses of Chan', only the Linji school survives today in China, Taiwan and Korea. Based on the teachings of Linji (d. 867), this school possibly provided Buddhism with its most 'Chinese' voice. Chan literature of the Linji and related schools were among the first texts ever written in vernacular as opposed to classical Chinese. Daoist elements also began to appear prominently. Zhuangzi's 'true man' becomes Linji's 'true man of no rank' who is going in and out of each person's face this very moment, and is always right here before one. The anecdotal humour associated with Zhuangzi's stories and the irreverent exploits of the Bamboo Sages of the Six Dynasties period clearly infused the style of Chan anecdotes. Rather than indulge in elaborate, complicated theoretical abstractions, Chan focused on experience as lived, in terms familiar to anyone immersed in Chinese culture (though often exotic to Western students, which has led to the common misconception that Chan is nonsensical or obscurantist).

Teaching techniques began to overshadow doctrinal content. At the heart of Chan training are the exchanges between teacher and student. Records, called *gongan*, were compiled of classic encounters, and even these eventually became part of the teaching techniques, as they were presented to students as riddles to concentrate on during meditation. To disrupt the sort of idle or pernicious speculation that could prove a hindrance to enlightenment, abrupt and shocking techniques were employed, from radical statements such as, 'If you meet Buddha on the road, kill him!', to exchanges punctuated by blows and shouts (all the more startling in the subdued monastic atmosphere in which they would unexpectedly occur). Linji's methods were designed to make students confront and overcome their mental and emotional habits and crutches, so as to become truly free and independent. Even dependency on Buddhism could be such a crutch. Linji summarized his teaching with the phrase: 'Don't be deceived.'

10 The Chinese Buddhist Schools: Pure Land

All forms of Chinese Buddhism, including Chan, contain devotional elements and rituals, but for Pure Land Buddhists devotionalism is the essence. The origins of Pure Land Buddhism are somewhat unclear. While undoubtedly devotional practices were imported to China by monks and laity (and these were blended with native Chinese forms of devotionalism), there does not seem to be a distinct school in India devoted to rebirth in Amitābha's Pure Land. As noted earlier, the traditional lineages are not very helpful for reconstructing the school's history. According to tradition, early contributors to Pure Land thought and practice include Tanluan (476-542), Dao Chuo (562-645) and his student Shandao (613-81). The term 'Pure Land' (*jingtu*) may itself be largely a product of certain license taken by translators. The term *jingtu* appears in Kumārajīva's translation of the *Vimalakīrti Sutra* where the Tibetan version simply has 'Buddha lands' (the Sanskrit version is no longer extant). Apparently, Xuanzang was the first explicitly to associate Sukhāvati (Amitābha's Paradise) with the term 'pure land'. The main scriptures for Pure Land practice were the Larger and Smaller *Sukhāvati-vyuha Sutras* and the *Guan Wuliangshuofo jing*.

At the beginning of the Tang Dynasty, several forms of Buddhist devotionalism were popular, including cults devoted to Mañjuśrī(Bodhisattva of Wisdom), Guanyin (Bodhisattva of Compassion, at that time particularly popular as a patron saint and protector of travellers), Maitreya (the future Buddha) and Amita (a conflation of Amitābha and Amitāyus whose names mean 'Infinite Light' and 'Infinite Life' respectively, and are possibly deities of Central Asian origin). Arguably the most popular form of devotionalism was the Maitreya cult. The

Empress Wu (r. 683-705), a great patron of Buddhism but generally reviled in Chinese history as an unscrupulous usurper, considered herself an incarnation of Maitreya. Due to her unpopularity once dethroned, people wanted to distance themselves from her and anything associated with her. Unfortunately this effectively extinguished Maitreya worship in China. Worshippers of Amita filled the void.

Pure Land theology maintained that people were living in the age of degenerate *dharma*, when study and personal effort were insufficient for making progress on the path to liberation. Relying on one's own efforts was in fact deemed a form of self-theory, or the selfishness and arrogance that comes from erroneous views of self. Rather than indulge in egoistic fantasies, one ought to rely on the power and grace of Amita. Amita was a *buddha* (whether he was an earlier incarnation of the historical Buddha or another person altogether is answered differently by different Pure Land sources) who, while still a *bodhisattva*, vowed to help sentient beings once he became a *buddha*. He has the power to transfer to anyone he deems worthy sufficient merit to enable them to be born in his Pure Land, the Western Paradise. In the earliest forms of Pure Land devotionalism a variety of practices were cultivated, but these were eventually pared down to chanting the *nianfo*, literally 'remembrance of Buddhas' (in Sanskrit, *buddhānusmṛti*), which in Chinese is 'Na-mu A-mi-to Fo' (Hail Amita Buddha).

11 Sinicizing Buddhist concepts

Since the time of Mencius, the ultimate ontological issue in China was the question of human nature and mind (which Mencius and most Chinese thinkers treated as synonyms). Pre-Han Chinese philosophers had debated whether human nature was originally good, bad or neutral. The written Chinese character for 'nature', *xing*, consists of two parts: the left side means 'mind' and the right side means 'birth', which led Chinese thinkers to debate whether human nature was determined by what one is born with, namely appetites and desires, or whether it reflects the nature of one's mind, which in Chinese thought invariably carried an onto-ethical rather than strictly cognitive connotation. The word *xin* literally means 'heart', indicating that - unlike Western conceptions that draw a sharp line between the head and the heart - for the Chinese, thinking and feeling originated in the same bodily locus. Feeling empathy or compassion as well as rationally abstracting principles and formulating ethical codes were all activities of *xin*, heart-and-mind (see Xin; Xing).

Indian Buddhism had little to say about human nature, with many forms of Buddhism rejecting the very concept of essential nature. Some of the early polemics against Buddhism in China explicitly attacked it for neglecting to address the question of human nature. The notion of Buddha-nature was developed, in part, to redress that failing. Since Indian Buddhists were deeply interested in the mind in terms of cognitive processes such as perception, thinking, attention and so on (see Mind, Indian philosophy of; Sense perception, Indian views of), it was a natural step for the Chinese to read these initially in the light of the Chinese discourse on mind, and to further develop interpretations of this material in line with Chinese concerns. Hence passages that in Sanskrit dealt primarily with epistemology or cognitive conditions often became, in their Chinese renderings, psycho-moral descriptions. The Sanskrit term *ekacitta*, a mind with singular focus (but literally meaning 'one mind') becomes the metaphysical one mind of the *Awakening of Faith in Mahāyāna*. Similarly, Indian and Chinese philosophers had developed very different types of causal theories. Indian Buddhists accepted only efficient causes as real, while Chinese Buddhists tended to interpret Buddhist causal theories as examples of formal causes.

12 Sinicizing Buddhist concepts: emptiness

Before Buddhism entered China Daoists had already embraced a notion of emptiness which it took Buddhists several centuries to realize was significantly different from their own (see Daoist philosophy). Laozi had contrasted the empty or open (*xu*) with the solid. What made a wheel functional was its empty hub; what made a vessel or room functional was its open space. Hence emptiness (or openness) is not worthless but rather the key to functionality and usefulness (see Daodejing). Later Daoists contrasted existents (*you*) with nonexistence (*wu*), and claimed that all existence emerges from nonexistence and ultimately returns to nonexistence (see You-wu). Some Chinese metaphysicians, such as Wang Bi, wrote about primordial nonexistence (*yuan wu*, *benwu*) as the metaphysical source, destination and substratum for all existent things. Thus form and emptiness were opposed, contrasting poles, and emptiness had primacy.

Some early Chinese Buddhists interpreted Buddhist emptiness in the same fashion, especially in the Prajñāschools. Eventually Buddhists realized, as the *Heart Sutra* says, that form and emptiness are not opposed to each other, but

that ‘form itself *is* emptiness, emptiness itself *is* form, form is not different from emptiness, emptiness is not different from form.’ In other words, Buddhist ‘emptiness’ did not mean ‘open’ or ‘nonexistence’. Emptiness (*śūnyatā*) signified the absence of an eternal, independent, self-causing, invariant, essential self-nature (*svabhāva*) or selfhood (*ātman*) in any thing or person. Whatever existed did so by virtue of a perpetually changing web of causes and conditions that themselves were products of other causes and conditions. Stated simplistically, emptiness does not mean that a table is unreal or nonexistent, or that its solid texture or colour are unreal; it does mean that the concept of tableness is unreal, and that the abstractions ‘solidity’ and ‘colour’ are unreal apart from the discrete and particular sensations one has at specific moments due to specific causes and conditions. Buddhist emptiness is not a primal void, but the absence of self-essence (see Buddhist concept of emptiness). To avoid being confused with Daoist concepts of emptiness, the Buddhists eventually chose a new term, *kong*, to render their ‘emptiness’.

Emptiness is neither the origin nor terminus for forms; forms themselves at any moment are emptiness. Since everything is causally connected with everything else, and there are no independent identities beyond or behind such causes and conditions, everything, according to Huayan, mutually interpenetrates and conditions everything else. Every thing defines and is defined by every other thing.

13 Sinicizing Buddhist concepts: suffering and ignorance

For all forms of Indian Buddhism, the fundamental fact with which Buddhism begins, and the problem it attempts to solve, is the problem of suffering (*duḥkha*). The first of the Four Noble Truths is: ‘All is suffering.’ Suffering does not mean simply pain. Buddhism does not deny joy, pleasure, delight and so on; but it claims that all is impermanent, so that whatever the source of a particular pleasure, that pleasure can never be permanent. The more pleasure one feels, the greater becomes one’s attachment to the presumed source. The greater the attachment, the greater the pain at the loss of that pleasure. Since everything is impermanent, such loss is inevitable. So, ironically, pleasure itself is ‘suffering’. Suffering is the affective reaction to impermanence. According to general Buddhist causal analysis, the causes of suffering are desire and ignorance. We desire permanent pleasures because we are ignorant of the fact that all is impermanent, empty of eternal selfhood. As the Four Noble Truths state, these causes of suffering can be eliminated, and Buddhism is the method or path for eliminating those causes. The purpose of Buddhism, then, is the elimination of suffering.

Chinese Buddhist texts do occasionally mention suffering, but usually in passing. Instead the root problem became ignorance. Discussions of the dialectical conflict between ignorance and enlightenment grew so pervasive that suffering was all but forgotten. This shift helped reinforce the emphasis on mind and mind-nature. Enlightenment was no longer defined as awakening to the causes of suffering, but instead denoted seeing the nature of the mind itself (see Suffering, Buddhist views of origination of).

14 Sinicizing Buddhist concepts: is Buddha-nature good or evil?

The pre-Han debate about whether human nature is good, evil or neutral was echoed in debates between Chinese Buddhists about Buddha-nature. Huayan contended that Buddha-nature and *tathāgatagarbha* were pristinely pure and good, filled with infinite good merits and qualities. In the fully realized perfection of Buddha-nature all evil, impurities and delusions have been eradicated.

This position was opposed by Tiantai, which argued that some evil (that is, some ignorance) remains in Buddha-nature. Following the Daoist sense of nonduality, in which good and evil or pure and impure are complimentary opposites as impossible to separate from each other as East from West, Tiantai accused Huayan of dualistic extremism. From the Tiantai perspective, Huayan’s ‘obsession’ with purity and goodness was one-sided and dualistic. Moreover, Tiantai insisted that it is necessary for Buddha-nature to retain some traces of evil and delusion in order to understand and empathize with the plight of ordinary sentient beings. If one becomes too rarefied, too transcendent, one loses touch with the everyday reality in which people wander deludedly, and thus one becomes incapable of effectively saving such people. Buddhahood, for Tiantai, was not simply a matter of correctly seeing or understanding in a ‘pure’ way, but was at its core salvific; Buddhahood is the active liberation of sentient beings from ignorance.

The debate on Buddha-nature heated up during the Song Dynasty. Heterodox forms of Tiantai tinged with

Huayan's 'purity obsession' appeared, and these were challenged sharply by the orthodox Tiantai thinkers from their headquarters on Tiantai mountain (from which the school took its name). The heterodox schools were labeled the Off-Mountain groups, while the orthodoxy styled itself the On-Mountain group. Zhili (959-1028), one of the On-Mountain leaders, had a keen intellect alert to the subtlest hints of Huayan-like thinking lurking in the rhetoric of Off-Mountain thinkers; his writings systematically ferret out and refute those implications with a logical sophistication rarely equalled amongst Chinese Buddhist philosophers.

These debates gain additional importance when viewed in the larger context of Chinese intellectual history. In the pre-Han period, Mencius' contention that human nature is originally good did not prove persuasive. Others argued that human nature was essentially neutral and subject to the influence of external conditions. Another early Confucian, Xunzi, had argued that human nature was basically selfish and greedy, which is why human society needs sages such as Confucius to guide them beyond the baseness of their own nature (see Xing). Han Confucians sided with Xunzi rather Mencius. The Tiantai position, by insisting that some evil and ignorance exists even in Buddha-nature, was close to some readings of Xunzi's position, while the idealistic optimism of the Huayan view clearly showed parallels with Mencius. Between the Han and Song Dynasties (third through tenth centuries), Confucianism was by and large intellectually stagnant. It found new vitality in the Song in part by reabsorbing back into itself the elements it had 'lent' to the Buddhists (and to some extent Daoists as well). The elements they took back had been modified and expanded by the Buddhists, and given metaphysical foundations that the neo-Confucians retained and continued to rework. Neo-Confucian thinkers, especially after Zhu Xi (1130-1200), rediscovered Mencius and unanimously embraced his view of the original goodness of human nature. Looked at another way, neo-Confucianism adopted Huayan's metaphysics of nature. Zhu Xi's famous dialectic of principle (*li*) and 'material-energy' (*qi*) owed more than a little to Huayan's *li* and *shi* metaphysics (see Li; Qi).

Buddhist philosophy, Indian

Buddhism was an important ingredient in the philosophical melange of the Indian subcontinent for over a millennium. From an inconspicuous beginning a few centuries before Christ, Buddhist scholasticism gained in strength until it reached a peak of influence and originality in the latter half of the first millennium. Beginning in the eleventh century, Buddhism gradually declined and eventually disappeared from northern India. Although different individual thinkers placed emphasis on different issues, the tendency was for most writers to offer an integrated philosophical system that incorporated ethics, epistemology and metaphysics. Most of the issues addressed by Buddhist philosophers in India stem directly from the teachings attributed to Siddhārtha Gautama, known better through his honorific title, the Buddha.

The central concern of the Buddha was the elimination of unnecessary discontent. His principal insight into this problem was that all dissatisfaction arises because people (and other forms of life as well) foster desires and aversions, which are in turn the consequence of certain misunderstandings about their identity. Discontent can be understood as frustration, or a failure to achieve what one wishes; if one's wishes are generally unrealistic and therefore unattainable, then one will naturally be generally dissatisfied. Since the Buddha saw human frustration as an effect of misunderstandings concerning human nature, it was natural for Buddhist philosophers to attend to questions concerning the true nature of a human being. Since the Buddha himself was held as the paradigm of moral excellence, it was also left to later philosophers to determine what kind of being the Buddha had been. A typical question was whether his example was one that ordinary people could hope to follow, or whether his role was in some way more than that of a teacher who showed other people how to improve themselves.

The Buddha offered criticisms of many views on human nature and virtue and duty held by the teachers of his age. Several of the views that he opposed were based, at least indirectly, on notions incorporated in the Veda, a body of liturgical literature used by the Brahmans in the performance of rituals. Later generations of Buddhists spent much energy in criticizing Brahmanical claims of the supremacy of the Veda; at the same time, Buddhists tended to place their confidence in a combination of experience and reason. The interest in arriving at correct understanding through correct methods of reasoning led to a preoccupation with questions of logic and epistemology, which tended to overshadow all other philosophical concerns during the last five centuries during which Buddhism was an important factor in Indian philosophy.

Since the Buddha saw human frustration as an effect that could be eliminated if its cause were eliminated, it was natural for Buddhist philosophers to focus their attention on a variety of questions concerning causality. How many kinds of cause are there? Can a multiplicity of effects have a single cause? Can a single thing have a multiplicity of causes? How is a potentiality triggered into an actuality? Questions concerning simplicity and complexity, or unity and plurality, figured prominently in Buddhist discussions of what kinds of things in the world are ultimately real. In a tradition that emphasized the principle that all unnecessary human pain and conflict can ultimately be traced to a failure to understand what things in the world are real, it was natural to seek criteria by which one discerns real things from fictions.

1 Human nature

A key tenet of Buddhist doctrine is that discontent is an outcome of desires grounded in false beliefs. The most important of these false beliefs are that (1) one's own individual existence is more important than those of other individuals, and that (2) fulfilment can be achieved by acquiring and owning property. If these misunderstandings can be replaced by an accurate view of human nature, suggested the Buddha, then unrealistic craving and ambition will cease, and so will frustration. Happiness, in other words, can be achieved by learning to recognize that (1) no one is more important than anyone else, since all beings ultimately have the same nature, and that (2) the very idea of ownership is at the root of all conflicts among living beings. The methods by which one achieves contentment, according to the Buddha, are both intellectual and practical. One can gradually become free of the kinds of beliefs that cause unnecessary pain to oneself and others by carefully observing one's own feelings and thoughts, and how one's own words and actions affect others. To counter the view that one's own individual existence is more important than the existence of other beings, Buddhist philosophers adopted the radical strategy of trying to show that in fact human beings do not have selves or individual identities. That is, an attempt was made to show that

there is nothing about a person that remains fixed throughout a lifetime, and also that there is nothing over which one ultimately has real control. Failure to accept the instability, fragmentation and uncontrollability of one's body and mind is seen as a key cause of frustration of the sort that one could avoid by accepting things as they really are. On the other hand, realizing that all beings of all kinds are liable to change and ultimately to die enables one to see that all beings have the same fundamental destiny. This, combined with the recognition that all living beings strive for happiness and wellbeing, is an important stage on the way to realizing that no individual's needs, including one's own, are more worthy of consideration than any other's.

The notion that one does not have an enduring self has two aspects, one personal and the other social. At the personal level, the person is portrayed in Buddhist philosophy as a complex of many dozens of physical and mental events, rather than as a single feature of some kind that remains constant while all peripheral features undergo change. Since these constituent events are incessantly undergoing change, it follows that the whole that is made up of these constituents is always taking on at least some difference in nature. Whereas people might tend to see themselves as having fixed personalities and characters, the Buddha argued it is always possible for people either to improve their character through mindful striving, or to let it worsen through negligence and obliviousness. Looking at the social aspects of personal identity, the Buddha maintained, in contrast to other views prevalent in his day, that a person's station in human society need not be determined by birth. According to the view prevalent in ancient and classical Indian society, a person's duties, responsibilities and social rank were determined by levels of ritual purity; these were in turn influenced by pedigree and gender and various other factors that remained constant throughout a person's lifetime. In criticizing this view, Buddhist philosophers redefined the notions of purity and nobility, replacing the concept of purity by birth with that of purity by action (karma) (see Karma and rebirth, Indian conceptions of §5). Thus the truly noble person, according to Buddhist standards, was not one who had a pure and revered ancestry, but rather one who habitually performed pure and benevolent actions.

Given these basic ideas of human nature as a starting point, later generations of Buddhist thinkers were left with the task of explaining the mechanisms by which all the components of a person work together; this also involved trying to explain how human beings can gradually change their character. While there was general agreement on the principle that the intentions behind one's actions led eventually to resultant mental states, that benevolent actions resulted in a sense of wellbeing, while malevolent actions resulted in uneasiness and vexation, the precise details of how karmic causality took place were a matter of much dispute. Especially difficult was the question of how actions committed in one lifetime could influence the character of a person in a different lifetime, for Buddhists accepted the notion of rebirth that was common in Indian systems of thought. Discussions of how people could improve their character presuppose that the people in question have not become irreversibly depraved. One controversy that arose among Buddhist thinkers was whether there are beings who become so habitually perverse that they can no longer even aspire to improve their character; if so, then such beings would apparently be heir to an unending cycle of rebirths.

The view of the person as a set of interconnected modules, the precise contents of which were always changing, was characterized by Buddhists as avoiding the untenability of two other hypotheses that one might form about human nature. One hypothesis is that a person has some essential core that remains unchanged through all circumstances. This core survives the death of the physical body and goes on to acquire a new body through a process of reincarnation. According to this view, the unchanging essential part of a person is eternal. The second hypothesis is that a person takes on an identity at birth and carries it through life but loses the identity altogether at death. The Buddhist view, characterized as a middle way between these two extremes, is that a person's character is always in flux, and that the factors that determine the particular changes in a person's mentality continue to operate even after the body housing that mentality dies. So Buddhists tended to claim that what goes from one living body to another is not an unchanging essence, but rather a set of tendencies to behave in certain ways.

2 Ethics

The strongest motivation for accepting the doctrine of rebirth was to support the notion that people are accountable for their actions to the very end of their lives; the doctrine thus plays a central role in Buddhist ethical theory. It was noted in the preceding section that the Buddhist view of the person was described as a middle path between two equally untenable extremes. In the realm of conduct also, the Buddhists described theirs as a middle path or a moderate position that avoided extreme views of human conduct. In order to understand the various positions

against which the Buddhists defined their views on appropriate conduct, it should be borne in mind that the central question being asked by the Buddha and his contemporaries was how to achieve contentment. The strategies recommended by different thinkers were closely related to their views of life after death. Those who held that a person has only one life tended to argue that one's life should be spent in the pursuit of as much pleasure as is possible without bringing pain and injury to oneself. Restraint in the pursuit of pleasure was seen as necessary only to the extent that excessive indulgence might shorten one's life and decrease one's opportunities for future pleasure seeking.

Philosophers who accepted the doctrine of rebirth, on the other hand, tended to argue that the only kind of happiness worth pursuing was lasting freedom from the pains and turmoil of life; this could be won only by bringing rebirth to an end. After death, they said, all living beings are eventually reborn in a form of life determined by the accumulated effects of deeds done in previous lives. Although some forms of life might be very pleasant and offer a temporary reward for previous good actions, every form of life involves some amount of pain and suffering, even if it is only an anxiety that one's present peace and happiness will eventually come to an end and be replaced by more direct forms of physical and mental pain. Therefore, the only hope of any lasting freedom from the pains of existence is to remove oneself from the cycle of birth and death altogether. Exactly how this was to be achieved was a matter of much controversy, but some drastic methods involved undergoing extreme forms of austerity and even self-inflicted pain. The Buddhist middle path, therefore, was one that avoided two extremes: one extreme was the self-indulgence of those who denied life after death altogether, and the other was the self-torture recommended by some ascetics as the only way to gain freedom.

Buddhist philosophers tended to agree that a person's mentality at any given moment is either virtuous, vicious or neutral. This means that all of one's mental characteristics in a given moment have the same orientation, which is either towards a state of happiness, the natural consequence of virtue, or towards a state of discontent, the natural consequence of vice. The principal virtues that were said to cooperate in a healthy mentality were correct understanding, which manifested itself as a sense of shame, and a sense of decency, usually interpreted as respect for oneself and respect for others. Thus if one has the virtue of having a sense of shame, then while that sense of shame is functioning, one will also have the virtues of being generous, free of malice and open-minded; having these virtues makes one likely to behave in ways that conduce to the health of oneself and others. If, on the other hand, one has the vice of being shameless, then one will also have the vices of being deluded and agitated and therefore prone to behave in ways likely to bring harm to oneself and others. While virtuous and vicious mental qualities cannot be present in the same mentality at the same moment, it could very well be that a person vacillates between virtuous and vicious frames of mind. Indeed, this is said to be the condition of the vast majority of living beings (see Duty and virtue, Indian conceptions of §3; Virtues and vices).

Despite a tendency to agree on these basic matters, Buddhist philosophers disagreed with one another over several other questions. There was, for example, controversy over whether people could arrive at stages of attainment from which they could never backslide. Some argued that once people gained certain insights into reality, then they could no longer be deluded in the ways that result in acting on self-centred motivations. Others argued that, even if backsliding might be unlikely for some people, it is in principle always possible, and therefore a person can never afford to be complacent. Another controversy arose over whether a vicious person could be fully aware of a virtuous person's virtues, some Buddhists holding the view that only a virtuous person can recognize that another person is also virtuous. Yet another matter of controversy had to do with whether the merit of being virtuous could be transferred to others. Some argued that each person is strictly accountable for their own actions and that no one can escape the ill effects of their intentionally harmful actions. Others claimed that merit can be transferred to others, enabling them to experience levels of happiness that they could never have deserved on the merit of their own actions. Closely tied to this controversy was the question mentioned above, concerning whether some beings fall into such states of depravity that they can no longer even aspire to be good. Those philosophers who accepted that beings could become depraved to this extent but denied that merit can be transferred had to conclude that some beings would never attain *nirvāṇa* (see Nirvāṇa). Other philosophers, for whom the prospect of eternal suffering in the cycle of birth seemed unjust, favoured the doctrine that merit could be transferred, thus enabling these thoroughly depraved beings to undergo the change of mentality necessary to begin leading a life of virtue.

3 Buddha-nature

Even in the earliest strata of Buddhist literature that has survived to the present, the Buddha is portrayed in a variety of ways. Some passages depict him as a man who skilfully answers questions that have been put to him, either by answering the questions or by showing why the question as asked cannot be answered. The passages were clearly designed to portray the Buddha as a paragon of wisdom, whose careful and analytic thinking could be used as a model for those seeking to arrive at correct understanding. The Buddha is also portrayed as a model of virtue, a man who has mastered the art of living in the world without bringing harm to other living beings and whose concern for the welfare of all living things around him is unsurpassed. Interspersed with these passages that focus on the Buddha as a remarkable man, there are other passages that portray the Buddha as a superhuman miracle worker whose mastery of yogic technique has given him the power to travel hundreds of kilometres in the blink of an eye, transport himself and his followers through the air, know the precise thoughts of other people, see into the past and future, heal serious wounds merely by looking at them, and soothe wild and dangerous animals by merely speaking gently to them. Some texts show him inviting his followers to question everything he says and to accept nothing on his authority; in other passages, he is portrayed as a man to whom even the wisest and most knowledgeable gods come so that the profound mysteries of the universe can be explained to them in clear words. Given the diversity of things said about the Buddha in the texts that Buddhists regarded as authoritative, it is no wonder that among the points about which there was considerable controversy was the nature of the Buddha himself. Discussions about the nature of the Buddha were as important to some Buddhist philosophers as discussions about the nature of God were to the theologians of theistic traditions (see Buddha).

The earliest extant record of controversies concerning the nature of the Buddha is a work known as *Kathāvatthu (Points of Controversy)*, supposed to have been written around 246 BC by an elder monk known as Tissa Moggalīputta. This treatise mentions over two hundred topics over which there was controversy among Buddhists, of which several pertain to the nature of the Buddha. According to this text, some Buddhists held to the view that the Buddha pervades all regions of space at all times and has the power to suspend all the laws of nature at will; others argued that the Buddha exists only where his human body is located and that he is bound by all the natural laws by which other living beings are bound. Those who accepted the Buddha as a ubiquitous and eternal entity tended to claim that the human Buddha was merely a manifestation in human form that appeared for the sake of guiding human beings. This apparition, they claimed, had no real need for food and shelter or other material requirements of life, but it accepted such gifts from devotees so that they might learn the benefits of generosity. Moreover, this apparition was said to be wholly lacking any of the unpleasant physical or mental traits of a human being and never had any thoughts that were not directed at teaching people how to cultivate virtue and attain *nirvāṇa*. Other Buddhists rejected this view of the Buddha altogether and argued that he was a mortal just like all other mortals, except that among the limited range of topics about which he had knowledge was the important matter of how to achieve lasting peace and happiness. This issue was controverted for over a millennium in India, with Dharmakīrti and some of his followers taking up the view of the Buddha as an ordinary mortal, while some members of the Yogācāra movement took up the position that the Buddha was more of a cosmic principle; the eleventh-century Buddhist Ratnakīrti eventually argued that all particular acts of individual awareness are merely parts of a single, universal consciousness, which he identified as the mind of the Buddha (see Buddhism, Yogācāra school of).

The position taken by Ratnakīrti may be the logical conclusion of an idea first mentioned in the *Kathāvatthu*, namely, that one becomes an Awakened One (*buddha*) by acquiring a quality known as awakening (*bodhi*). Tissa Moggalīputta himself rejected this idea, arguing that if awakening were something that one could attain, it would also be something that one could lose, in which case a *buddha* could cease to be a *buddha*; his view, therefore, was that awakening is not a positive trait but merely the absence of delusions. Dissenting from this view, other Buddhists (and especially members of the Yogācāra school) argued that *buddhas* become *buddhas* as a result of realizing an innate potential to become awakened. This innate potential, called the embryo of the knower of truth (*tathāgata-garbha*), was said by some to exist in all living beings, thereby making all living beings *buddhas*, or at least *buddhas* in the making. From this view that every sentient being has the essential quality of a *buddha*, even if this essence is somehow obscured from view by others, it was a short step to the view that all sentient beings are identical in their essence and therefore not really different from one another. Closely related to this controversy over the nature of the Buddha's essence was the issue of whether there are degrees of buddhahood or different ranks of *buddhas*. Tissa Moggalīputta had argued that being a *buddha* is a matter of being free of delusion, and either one is free or one is not; there can be no degrees of freedom. Other thinkers took the view that although all

beings are essentially *buddhas* in their nature, they manifest their essences to a different extent, and therefore one may speak of degrees of buddhahood.

4 Epistemology

Siddhārtha Gautama the Buddha is portrayed in Buddhist literature as ridiculing the sacrificial rituals of the Brahmans and accusing the priests of fabricating them for no better reason than to make money from the wealthy and to manipulate the powerful. Attacking the sacrificial practices of the Brahman priests in this way eventually led to challenging the authority of the Vedic literature that the priests considered sacred. An early Buddhist philosopher who challenged the authority of sacred texts was Nāgārjuna, whose arguments called into question the very possibility of justified belief. In a text called *Vigrahavyāvartanī(Averting Disputes)*, Nāgārjuna argued that all opinions are warranted by an appeal to experience, or to various forms of reasoning, or to the authority of tradition. Now among the opinions that one may hold, said Nāgārjuna, is the opinion that all opinions are warranted in one of those ways. Nothing, however, seems to warrant that opinion. If one should claim that that opinion is self-warranting, then why not grant that all other opinions are also self-warranting? On the other hand, if that opinion requires substantiation, the result will be an infinite regress. Therefore, concluded Nāgārjuna, no opinion can be grounded. Realizing that one can never arrive at certainty thus becomes for Nāgārjuna the most reliable way of freeing oneself from the various delusions that cause unhappiness in the world. Dispelling delusions is therefore not a matter of discovering truth, but a matter of realizing that all opinions that pass as knowledge are not really knowledge at all.

Although Nāgārjuna's scepticism managed to capture the spirit of some passages of Buddhist literature that depict the Buddha as questioning the authoritarianism of other teachers, it did not leave adequate room for distinguishing truth from error. Most Buddhist philosophers who came after Nāgārjuna, therefore, placed an emphasis on both eliminating error and securing positive knowledge. Dignāga, modifying theories of knowledge that Brahmanical thinkers had developed, argued that there are just two types of knowledge, each having a distinct subject matter unavailable to the other: through the senses one gains knowledge of particulars that are physically present, while the intellect enables one to form concepts that take past and future experiences into consideration.

In an important work called *Ālambanaparīkṣa (Examining the Support of Awareness)* Dignāga developed an argument that his predecessor Vasubandhu had made. Here Dignāga argued that a cognition is accurate only if the subject matter of the cognition is identical to that which causes the awareness to arise. So, for example, if one sees a dead tree in the dark and takes it to be a man, then the subject matter of the cognition is a man, which is not identical to the dead tree that is causing the cognition; the cognition is therefore inaccurate. Given this principle, said Dignāga, it follows that none of our sensory cognitions is accurate, because each of them is really caused by atoms massed together; nevertheless, we are never aware of anything as a mass of atoms. Instead, what we are aware of is such things as human beings, elephants and trees. These notions of things as human beings or elephants, however, are purely conceptual in nature and are not in accord with the realities that exist in the external world. Therefore, he concluded, the only objects of our awareness are concepts; we are never directly aware of realities as they occur outside the mind.

Dignāga's essays rekindled an interest in epistemological questions among Buddhist philosophers that lasted for several centuries. As influential as his theories in logic and the sources of knowledge were, there was little in them that explicitly referred to previous Buddhist doctrine. It was left to the systematic philosopher Dharmakīrti to draw out the implications that questions of logic and epistemology had for people interested in the traditional Buddhist preoccupation with eliminating delusions concerning the nature of the self in order to win freedom from discontent.

Dharmakīrti's system of epistemology was centred around his criticism of the Brahmanical doctrine of the special authority of the Veda, which the Brahmans supposed had been revealed to humanity by God. He combined this criticism with a defence of the doctrine that the Buddha was a source of knowledge. The Brahmanical claim of authority for their scriptures is based upon the notion that God is omniscient and compassionate; this idea, said Dharmakīrti, is extravagant and laughable. The Buddhist claim for the authority of the Buddha, on the other hand, is based on the modest claim that the Buddha was an ordinary man who could see the root cause of discontent, knew how to eliminate the cause, and took time to teach other human beings what he had discovered. Moreover, argued Dharmakīrti, the Buddha taught nothing but principles that every human being could confirm. Full

confirmation of the Buddha’s teachings was said to be impossible for a person whose vision was still clouded by delusions. On the other hand, to a person who had learned to listen to wise counsel, reflect on it and then put it into practice, all the teachings of the Buddha on the question of winning *nirvāṇa* would be confirmed.

The form of reflection that Dharmakīrti recommended was based upon a systematic study of the principles of legitimate inference; most delusions, he contended, stem from forming hasty generalizations from limited experience. Most doctrinal matters about which philosophers dispute, he said, cannot be decided with certainty. In this respect, Dharmakīrti adopted the cautious attitude of the Buddha and Nāgārjuna towards unwarranted opinions and assumptions. At the same time, he tried to show that the extreme scepticism that had characterized the work of such thinkers as Nāgārjuna was also unwarranted. This epistemological ’middle path’, consisting of modest claims about the extent of the Buddha’s knowledge and yet insisting that the Buddha’s doctrines were true and distinguishable from falsehoods, set the tone for most of the Buddhist philosophy that evolved in India until the time that Buddhism stopped being an important factor in the philosophical milieu of the Indian subcontinent. The focus on epistemological issues enabled Buddhists to set aside the sometimes bitter disputes over the question of which Buddhist scriptures were authentic (see Epistemology, Indian schools of §1).

5 Metaphysics

Given the emphasis in Buddhist teachings on the role of erroneous belief as a cause of unhappiness, it was natural that Buddhist philosophers should focus on questions of ontology and the theory of causation. Ontology was important, since a kind of intellectual error that was supposed to lead to unhappiness was being mistaken about what exists. The theory of causation was important, since the eradication of the cause of unhappiness was supposed to result in the removal of unhappiness itself.

The earliest attempts to systematize the teachings of Buddhism were in the genre of literature known as ‘Abhidharma’, in which all the factors of human experience were classified according to a variety of schemata (see Buddhism, Ābhidharmika schools of). The study of the relationships among these classes of factors eventually evolved into a detailed theory of causality, in which several types of causal relationship were enumerated. There were many schools of Abhidharma, and each had its own set of schemata for the classification and enumeration of the factors of experience. Indeed, each had its own interpretation of what the very word ‘Abhidharma’ means; among the possible interpretations of the word, a common one is that it means a higher or more advanced doctrine, or a doctrine that leads to a higher form of wisdom. The variety of approaches taken in Abhidharma literature makes it difficult to discuss this literature in any but the most general way. Among most schools of Abhidharma, there was a commitment to the idea that the best strategy for coming to an understanding of any complex being is to analyse that being into its ultimate parts. An ultimate part is that which cannot be analysed into anything more simple. Most Buddhist systematists held to the principle that the ultimately simple building blocks out of which things are made are ultimately real, while complex things that are made up of more simple parts are not ultimately real; they are held to be real only through the consensus of a community. As was seen above in the section on human nature (§1), for example, there was a strong tendency for Buddhists to accept that a person’s character is the product of many components; these components were held to be real, but the person was held to be ultimately unreal. The idea of a person may be a fiction, but it is one that makes the running of society more manageable, and therefore it can be regarded as a consensual reality, in contrast to an ultimate reality.

The philosopher Nāgārjuna questioned the whole attempt to make a distinction between consensual and ultimate truths. One interpretation of his philosophical writings is that he was trying to show that every attempt to understand the world can only be an approximation on which there may be some degree of consensus; there is, however, no understanding that can claim to have arrived at an adequate description of things as they really are. Along with this radical criticism of the very enterprise of trying to discern ultimate from consensual realities, Nāgārjuna criticized the doctrine that the simple constituents that serve as causes of more complex beings are more real than the complex beings themselves. This principle had rested on the assumption that the more simple a being is, the closer it is to being independent. In fact, he argued, the apparently simple constituents are no less dependent than their apparently complex effects. To this fact of being dependent upon other things, Nāgārjuna gave the name emptiness; since all beings are dependent for their existence on other beings, he said, all beings are empty.

Later Buddhist philosophers, beginning especially with Dharmakīrti, devoted their energy increasingly to refuting the claims, advanced by some Brahmanical thinkers, that the whole universe can be traced back to a single cause.

Dharmakīrti argued that if all things in the history of the world had a single cause, such as God or some type of primordial matter, then there would be no way to account for all the formal variety in the world at any given time, nor would it be possible to account for the fact that events unfold in sequences. If all the formal and temporal diversity are already inherent in the cause, he argued, then the cause is not a single thing after all. One might argue that the diversity exists in the single cause only as a potential of some kind; this, however, only raises the problem of explaining how that potential is actualized. If the potential is activated by something outside the cause that possesses it, then the outside agency must be counted among the causal factors along with the primary cause, in which case there is no longer a single cause. Besides general arguments directed against the view that all things could have any single cause, Dharmakīrti also gave arguments against the existence of a creator God in particular. The universe, he observed, shows no signs of having been designed by anyone intelligent. Even if it were conceded for the sake of argument that the world might have been made by some intelligent being, there is still no sign that this being had any concern for any living beings. Later generations of Buddhist philosophers expanded upon Dharmakīrti's arguments against the existence of a single intelligent creator, but most of these expansions took the form of replying to the objections of opponents rather than formulating new arguments (see Causation, Indian theories of §6).

During the last five hundred years that Buddhism was an important factor in Indian philosophy (600-1100), criticism of Buddhist doctrines by Brahmanical and Jaina religious philosophers, as well as from anti-religious materialists, forced Buddhist thinkers to refine some of their arguments and even to abandon some of their doctrinal positions. Arguments among Buddhists became much less a feature of Buddhist philosophy than arguments against non-Buddhist opponents. Within Buddhism itself, there was a tendency to try to reconcile differences that in earlier centuries had divided Buddhists against each other, at least doctrinally. This new spirit of overcoming sectarianism resulted in several ingenious attempts to fuse the old Abhidharma schools, the Mādhyamika schools, the Yogācāra schools and the Buddhist epistemologists. Few new issues were raised in this last five-hundred-year period, and not many new arguments were discovered to defend old positions. Careful scholarship tended to replace philosophical innovation as the principal preoccupation of later Buddhist intellectuals, such as Śāntarakṣita, Kamalaśīla, Jñānaśrīmitra and Ratnakīrti. It was during this period of the decline of Buddhism in India that Buddhist philosophy was introduced into Tibet. Once established there, it received a new impetus from a range of Tibetan intellectuals who were able to study many of these doctrines with a fresh perspective.

Buddhist philosophy, Japanese

Buddhism transformed Japanese culture and in turn was transformed in Japan. Mahāyāna *Buddhist thought entered Japan from the East Asian continent as part of a cultural complex that included written language, political institutions, formal iconography and Confucian literature. From its introduction in the sixth century through to the sixteenth century, Japanese Buddhism developed largely by incorporating Chinese Buddhism, accommodating indigenous beliefs and reconciling intersectarian disputes. During the isolationist Tokugawa Period (1600-1868), neo-Confucian philosophy and Dutch science challenged the virtual hegemony of Buddhist ways of thinking, but served more often as alternative and sometimes complementary models than as incompatible paradigms. Only since the reopening of Japan in 1868 has Japanese Buddhist thought seriously attempted to come to terms with early Indian Buddhism, Western thought and Christianity.*

Through the centuries, Buddhism gave the Japanese people a way to make sense of life and death, to explain the world and to seek liberation from suffering. When it engaged in theorizing, it did so in pursuit of religious fulfilment rather than of knowledge for its own sake. As an extension of its practical bent, Japanese Buddhist thought often tended to collapse differences between Buddhism and other forms of Japanese religiosity, between this phenomenal world and any absolute realm, and between the means and end of enlightenment. These tendencies are not Japanese in origin, but they extended further in Japan than in other Buddhist countries and partially define the character of Japanese Buddhist philosophy.

In fact, the identity of 'Japanese Buddhist *philosophy' blends with almost everything with which we would contrast it. As a development and modification of Chinese traditions, there is no one thing that is uniquely Japanese about it; as a Buddhist tradition, it is characteristically syncretistic, often assimilating* Shintō*and* Confucian philosophy *in both its doctrines and practices. Rituals, social practices, political institutions and artistic or literary expressions are as essential as philosophical ideas to Japanese Buddhism.*

Disputes about ideas often arose but were seldom settled by force of logical argument. One reason for this is that language was used not predominately in the service of logic but for the direct expression and actualization of reality. Disputants appealed to the authority of Buddhist sūtras *because these scriptures were thought to manifest a direct understanding of reality. Further, as reality was thought to be all-inclusive, the better position in the dispute would be that which was more comprehensive rather than that which was more consistent but exclusive. Politics and practical consequences did play a role in the settling of disputes, but the ideal of harmony or conformity often prevailed.*

The development of Japanese Buddhist philosophy can thus be seen as the unfolding of major themes rather than a series of philosophical positions in dispute. These themes include the role of language in expressing truth; the non-dual nature of absolute and relative, universal and particular; the actualization of liberation in this world, life or body; the equality of beings; and the transcendent non-duality of good and evil.

1 Language

The practical, soteriological nature of Buddhism makes it wary of what Wittgenstein called the bewitchment of the mind by language. Yet the view that Buddhism disregards language is an oversimplification, especially in Japan. Japanese Buddhism has a positive appreciation of language, particularly of its non-referential usage. Buddhist thought first came to Japan in the form of *sūtras* and commentaries written in Chinese characters. Written language was still so novel, and categories of thought so limited, that the content of these texts could be read as manifestations of new realities rather than as ideas referring to Buddhism. Some of the earliest literature composed in Japan, such as the poetry collection *Man'yōshū*, mentions *kotodama*, the spiritual power of words that makes things present. Although scholars articulated this theory of language only much later and aligned it with Shintō(see Motoori Norinaga), it may apply to the early understanding of Chinese Buddhist as well as indigenous words. Words had the power not only to manifest things in the world but also to change them; before Buddhist texts represented a doctrinal and ethical system, they provided incantations to heal illness and bring prosperity to the land.

The ritualistic use of language continued through the centuries and was often central to the expression of doctrine.

Practitioners often used single words or phrases as the condensed form of a doctrine or lengthy *sūtra*. Kūkai, for example, recited the Sanskrit formulas for the Womb and Diamond Mandalas to better envision these pictorial representations of the cosmic order. He proposed that intoning mantras could make the basic sounds of the cosmos audible. He used *dhāraṇī* or magical formulae not only as a means of purifying body and mind and allowing him to understand the point of every Buddhist scripture, but also as the means by which his patron bodhisattva could fulfill all wishes. Even when later Pure Land School teachers such as Shinran suspected discursive language and discouraged belief in worldly benefit through magical transformation, they taught that the sincere invocation of Amida Buddha's name has the power to actualize the salvation of all sentient beings. Buddhists of the Nichiren schools chanted the name of the *Wondrous Lotus Sutra*, *namu myōhōrenge kyō*, as a condensation and realization of all doctrines contained in it. Rinzai Zen teachers advocated the practice of *kanna* or 'contemplating the [crucial] phrase' of a dialogue, or of compressing the already condensed *Heart Sutra* into a single word. As long as the words are 'live' and not dead repetitions, Zen teachers conceived such practices as shortcuts to enlightenment that immediately put the practitioner in a frame of mind to realize the point of Buddhist doctrines.

The transformative as well as expressive nature of language is evident in perhaps the most important collection of premodern Japanese philosophical literature, the *Shōbōgenzō(Treasury of the True Dharma Eye)*, by the thirteenth-century Zen master Dōgen. One chapter begins: 'As for the Buddha Way, not to voice it is impossible.' This statement does not command one to proclaim the teachings of Buddhism, but rather connects one's attainment of truth with its expression in the world. Such expression includes but is not limited to language. Another chapter of the *Shōbōgenzō* states, 'All buddhas and patriarchs are able to voice the Way', that is, to express truth in all their words and actions. By virtue of their realization of non-duality or no ultimate opposition, they can directly express the Way and not merely refer to it. They can also experience as the words of the Buddha 'the preaching of non-sentient beings', the 'sounds of the valley streams and the forms of the mountains'. This idea, explained further below (see §5), seems to collapse any ultimate distinction between sign and signified. Words express themselves, as do valley streams and the forms of mountains. This 'expressing' or 'voicing of the Way' does not stand for or represent something other than itself, and language used representationally is not privileged to express reality. The limitation placed on the power of representational language here is accompanied by an expanded meaning of 'expression' or 'voicing of the Way' that includes both linguistic and nonlinguistic forms.

2 Doctrine and truth

When early readers began to understand Buddhist texts as expressions of doctrines, and implicitly to grasp written language as signs signifying ideas, they came to understand the world in terms of formerly unseen relations. The Buddhist categories they applied were Chinese translations of Sanskrit terms, and this usage remained predominant even after modern Japanese scholars turned to Indian sources. The categories included names for the basic factors or elements of existence and the relations of cause and effect, conditioned and unconditioned, part and whole, relative and absolute.

The first systematic study of these categories and relations occurred in the so-called six schools of Nara, during the historical period of the same name (710-81). These 'schools' were more bodies of doctrine than independent sects with their own adherents. Often the doctrines were studied together in the same locale, such as the great temple Tōdaiji. The Japanese version of the Indian Abhidharmakośa school stressed the analysis of some seventy five conditioned and unconditioned constituents (*dharmas*) of existence and some ten types of direct and indirect causes that give rise to the conditioned factors.

As abstract as it appears, this analysis was intended as a kind of psychological examination to remove obstacles on the path to liberation. The Jōjitsu (Establishment of Truth) school proceeded to show the emptiness, or lack of substantial reality, of all constituents. The Ritsu (Precept) school conveyed very specific ethical and administrative rules to regulate the ordination and life of monks and nuns, and taught that the observance of precepts was one purification necessary for enlightenment. As discussed below, however, it did not provide an ethical theory or general principles for determining good and evil (see §6).

The Sanron (Three Treatises) school derived from Indian Mādhyamika philosophy (see Buddhism, Mādhyamika: India and Tibet). It practiced the refutation of all claims of the existence or non-existence, truth or falsity, of separate elements and doctrines. The discursive language used to refute all views ultimately pointed to its own limit, beyond which lay absolute truth. The Hossōschool formed the scholastic counterpart to Indian Yogācāra or

'consciousness-only' philosophy (see Buddhism, Yogācāra school of). It criticized the Mādhyamika tendency to absolutize emptiness, explained the role of consciousness in the appearance of self and world, and taught that enlightenment requires a conversion of the deep unconsciousness, called the 'storehouse' consciousness. It rejected the teaching that enlightenment is equally attainable by all. The sixth school, the Kegon (Flower Garland), was historically no more influential than these last two, but introduced a principle crucial to an understanding of the treatment of doctrines and truth in subsequent Japanese Buddhism.

The Nara schools took over doctrines and analyses from their Chinese counterparts virtually without change. These doctrines were partially incompatible with each other, but the discrepancies seemed little cause for dispute. Various doctrines and categories show up in later Japanese Buddhist philosophy, often as a foil for more innovative ideas. An example is the way the Abhidharma breakdown of reality and time forms the springboard of one chapter of Dōgen's *Shōbōgenzō*, 'Ocean Reflecting Samādhi'. This work first accepts the Abhidharma analysis of the causal arising of all elements but then disrupts it to proclaim the totality and sufficiency of each moment. In general, the failure of scholastic doctrines to challenge later generations of Japanese Buddhist thinkers is a sign that the latter have been more at home with practical reasoning and reconciliation than with formal argumentation and adjudication of claims. Indeed, until its introduction from the West there was in Japan no formal logic, where the rules of validity are separable from the content of the argument (see Logic in Japan). This lack does not necessarily point to a deficiency in the ability to reason, however, but may have to do with a way of relating absolute and relative, universal and particular. The philosophy of the Kegon school best epitomizes that way.

The Kegon school accounted for the variety of doctrines by placing them in a scheme of increasing difficulty and comprehensiveness. The level of the teachings matches the hearer's capacity to understand. Partial teachings, in other words, are 'skillful means' designed to lead one to more difficult and comprehensive teachings. The Kegon school typifies the inclusion characteristic of much of Japanese and Chinese Buddhist thought. One Buddhist school would incorporate rather than exclude the doctrines of rival schools, but would regard them as incomplete and place them on a lower level. To be sure, the hermeneutic of inclusion was often politically motivated, intended to increase a power base by incorporating and not alienating other groups; but it also followed the dialectical principle that rival or alternative beliefs were partial truths that fit into a larger scheme.

The Kegon scriptural hermeneutic privileged its own source *sūtras* and was rivalled by a similar scheme offered in the tremendously influential *Lotus Sutra*, but it developed a philosophy of totality and interrelation crucial for understanding most Japanese Buddhist thinking. According to this philosophy, each part or constituent of reality perfectly reflects the whole, and the whole depends upon each and every constituent part. All individual parts are therefore equivalent as conditions of the whole, and at the same time they are distinct and interdependent. The implications of this philosophy of nature for a theory of truth are the key to approaching Japanese Buddhist thought. There is no whole, universal or absolute, without its manifestation in concrete, distinct and relative particulars. In the twentieth century, Nishida Kitarō reformulated this principle paradoxically: the more relative a truth is - that is, the more deeply embedded or embodied in particulars - the more absolute it is. The absolute must encompass the relative, not stand in opposition to it. In general, Japanese Buddhist philosophy developed through a kind of synecdochic argumentation that appealed not to *a priori* reasons or empirical evidence, nor simply to scriptural sources of authority, but to this mutual accommodation of relative and absolute.

3 Universal and particular

Three interrelated themes display the mutual accommodation of relative and absolute, universal and particular: the locus of liberation, its actuality and the equality of beings.

Indian Mahāyāna *sūtras* introduced the idea that liberation does not lead to a transcendent realm different from this world, but they often spoke of the 'three immeasurable eons' required for its attainment. In contrast, many seminal Buddhist thinkers in Japan developed one Chinese view of the locus of liberation: the idea of becoming a buddha in this very body (*sokushin jōbutsu*). For Saichō(767-822), the founder of the Tendai school, it meant only a partial realization of buddhahood; but by the time of Tendai scholar Annen (841-89?) it referred to buddhahood attained in this very life. Kūkai (774-835), founder of the rival Shingon school, taught that yogic practices involving body (*mudra*s or symbolic hand gestures), speech (*mantras*) and mind (mental concentration and visualizations) could unify the practitioner with the Buddha Mahāvairocana. Such practices made it possible to attain buddhahood in this very body. This doctrine, popularized by Kūkai, provided a theoretical basis for the bodily aspects of practice

and the enactment of rituals that were important especially in the esoteric traditions of Tendai and Shingon Buddhism.

In summary, the idea of becoming a buddha in this very body or life involved a temporal and a metaphysical reduction. First, it collapsed the various stages of the path to enlightenment that were so important in various Buddhist traditions, and reduced the ‘three immeasurable eons’ to one lifetime. Second, it collapsed any remnant of a difference between the physical reality of life on earth and a transcendent realm, between the transient human body and the transcendent *dharma*-body. The body we are born with is the site of realization and symbolically embodies the entire universe, the ‘truth-body’ of the Buddha. Dōgen modified the idea further and proclaimed that ‘this very mind is buddha’ (*sokushin zebutsu*) when the discursive mind was disengaged. Although Dōgen speaks of ‘mind’ and not body, no psychophysical dualism is implied here.

Other Buddhist reformers of the Kamakura period (1192-1333) qualified the idea that liberation was possible in this world or life. Hōnen and Shinran placed this possibility in the Pure Land, which they usually considered as immediately accessible if intermediate between this world and the realm of final enlightenment. Even where it was imagined as a different world, this Pure Land was not nearly so remote a goal as Indian views of *nirvāṇa*, and was sometimes in effect made immanent in this world. Ippen explicitly stated that the Pure Land was indeed identical with this world. Nichiren too emphasized this world as the locus of salvation.

The affirmation of this world in Japanese thought is often called phenomenalism (see Phenomenalism), but this description neglects the principle or absolute said to interpenetrate all phenomena. One tenet of Kegon philosophy was that ‘principles are not impeded by things’ (*rijimuge*). Tendai Buddhism stressed the Mahāyāna doctrine of the ‘identity of the phenomenal and the real’ (*genshōzoku jissō*), and proposed that the phenomena of the world are aspects of Buddha. Dōgen wrote that the ‘true reality’ (*jissō*) is in fact all things, and that birth and death (impermanence) (see Mujō) is Buddha or *nirvāṇa*. To understand these developments in Japanese Buddhism, however, one needs to consider the question of the actuality of liberation.

4 Universal and particular (cont.)

Many Indian Mahāyāna *sūtras* teach that all sentient beings possess the nature of Buddha. The *Lotus Sutra* proclaims further that the historical Buddha is not a man who attained awakening but rather is a manifestation of the universal buddhahood that is available to all. It rejected schemes that differentiated levels of potential in beings and that excluded the lowest level from eventual enlightenment. Saichōadvocated universal buddhahood, based on the language of the *Lotus Sutra*. Universal buddhahood and ‘becoming Buddha in this very body’ are ideas based on the notion of *hongaku*, the Chinese doctrine that all beings are ‘originally or inherently awakened’. Inherent enlightenment, in contrast to ‘acquired enlightenment’, is timeless and independent of spiritual development. For some contemporary scholars such as Tamura Yoshirō, the *hongaku* idea is definitive not only of Buddhism in medieval Japan but of Japanese culture in general, since it underlies the ideals of equality, harmony and conformity (Tamura 1987).

The ideas of inherent and acquired enlightenment do not form logical contraries, since both depend upon the buddha-nature in all beings, but rather pose a practical question: how is this innate enlightenment related to practice? Legend has it that Dōgen encountered this question in his boyhood Tendai training and made it an existential problem: why undergo rigorous practice when we are endowed with ‘*dharma* nature’ by birth? Dōgen’s answer is thought to be a criticism of the *hongaku* idea, but can also be seen as its limit. He proposed ‘the unity of practice and realization’: ‘The *dharma* [truth] is not manifested unless one practices; it is not attained unless there is realization’ (*Shōbōgenzōbendōwa*). The practice of concentrated mind-body, epitomized in *zazen* or seated meditation, is a way to actualize our inherent nature. In §1 above, Dōgen’s words were quoted: ‘As for the Buddha Way, not to voice it is impossible… ’ and this sentence concludes: ‘not to study [practice] it is remote.’ Dōgen thus collapses the distinction between practice as means and enlightenment as end. Instead, *zazen*, the practice of awakening, becomes the manifestation of enlightenment.

Like Dōgen, other Kamakura Period Buddhist reformers reacted against the complacency encouraged by the idea of original enlightenment, but modified rather than rejected it. For Hōnen and Shinran the only ‘practice’ that counts is the *nembutsu* or invocation of the Buddha Amida. In his form as the Bodhisattva Dharmakara, Amida enunciated a primal vow that made his enlightenment contingent on that of all sentient beings. Those with sincere

faith in Amida’s vow were assured of rebirth in the Pure Land, where final enlightenment will be possible. In the original story, countless lifetimes elapse before Dharmakara becomes Amida Buddha, but the logic of the conditions may suggest a non-dual, timeless relation: since Amida Buddha is indeed here to save us, our liberation need only be actualized in this moment. Some writings of Shinran explicitly suggest that to recollect Amida Buddha with a believing mind (*shinjin*) is already to actualize buddhahood, without waiting to be reborn in the Pure Land. Moreover, this entrusting invocation is strictly speaking not a practice at all; that is, it is not accomplished through one own efforts or ‘self-power’ but rather is a gift of Amida, a result of Amida’s ‘other-power’. Ippen stated that ‘the *nembutsu* is what recites the *nembutsu*’. Although faith in personal effort is considered futile, as in some interpretations of inherent enlightenment, true reality must be activated by personal faith. This again is a variation on the theme of the actualization of reality (see Faith; Salvation).

5 Universal and particular (cont.)

The idea of universal buddhahood supported both syncretistic tendencies in Japanese Buddhism and the equality of all beings. The first undermined any ultimate difference between Buddhist and Shintōobjects of veneration, and the second any difference between the human and natural worlds, or what we today call culture and nature.

Syncretistic tendencies were formalized in the theory of *honji suijaku*. This theory regarded indigenous Shintōdeities (*kami*) as trace manifestations (*suijaku*) of buddhas and *bodhisattva*s, who were their original ground or true nature (*honji*). The theory appears to establish a hierarchical relationship, with the *bodhisattva*s as more basic and important than the *kami*, and thus Buddhism as more fundamental than Shintō. This interpretation implies that the Shintōgods cannot exist without the Buddhist ideal beings. It not only reverses the historical order of their appearance in Japan; it misplaces the emphasis. In fact, the *honj-suijaku* theory often worked to set the two realms and their objects of veneration on a par with one another. If a *kami* functioned as a trace or attribute of a bodhisattva, the particular *bodhisattva* was best manifested in the *kami*. The reality of the one depended upon that of the other. This interdependence was explicit in a Tendai version of *honji suijaku* theory according to which the true nature could only be perceived in its manifestations. A fourteenth-century Shintōschool simply reversed the order of *bodhisattva* and *kami*. Moreover, specific Buddhist and Shintōideal beings are sometimes identified with one another and then contrasted with other pairs. In the twentieth century, a ‘new religion’ called Gedatsukai in effect identifies the Buddha Mahāvairocana and the Shintōdeity Tenjinchigi as *honji*, and gives other Buddhist-Shintōdeities the status of *suijaku*. These examples illustrate that the accessibility of ideal beings was more important than any rank order, which was historically variable (see Shintō).

The theory of original ground and trace manifestation was developed in the late Heian Period (794-1185), contemporaneous with the idea of inherent enlightenment. Yet the underlying association of Shintōand Buddhism is evident much earlier and lasted until much later. At the very beginning of Japanese Buddhism, the *Nihon shoki (Chronicles of Japan)* report that the Emperor Yōmei (d. 587) ‘believed in the Law of the Buddha and reverenced the Way of the Gods’. Yet the name ‘Way of the Gods’ (Shintō) was a Chinese, quasi-Buddhist concept. In effect, Buddhism prevailed and was established as the state religion, at least temporarily, through the efforts of Yōmei’s sister, Empress Suiko, and especially of his son, Prince Shōtoku, who wrote commentaries on *sūtras* and built temples (see Shōtoku Constitution). In the Nara Period (710-81), Shintōshrines were incorporated into Buddhist temples in order to protect land interests, and Buddhist altars built near shrines ensured the protection of Shintō. At one locale the god of war, Hachiman, was named the Bodhisattva Daijizaiten in 783; at others he was associated with different *bodhisattva*s. In the ninth century, Kūkai proposed a ‘dual aspect’ theory that, for example, identified the sun goddess Amaterasu with Mahāvairocana, the Buddha of Great Illumination, whom Kūkai further identified with the *dharmakāya* or truth-body of Buddha. Although Tokugawa Period (1600-1868) nativists such as Motoori Norinaga reasserted the superiority of indigenous Shintō, the Buddhist inclusion of Shintōwas not effectively challenged on a national scale until the early Meiji government’s policies (in the 1870s) of ‘separating gods and buddhas’, persecuting Buddhism and establishing State Shintō. Religion and state have had separate legal status since the Second World War, but Buddhist and Shintōteachings and customs still coexist in Japanese family life.

Japanese Buddhist thought extended the idea of universal buddhahood to the equality of all beings. In particular, the idea of inherent enlightenment lent support to the doctrine of the Buddha-nature of non-sentient beings that is often alluded to in medieval Japanese literature. It was both Tendai and Nichiren doctrine that the grass and trees -

in other words, beings not possessed of a sensitive mind - can become buddhas: ‘Grasses, trees, mountains and rivers all attain buddhahood’ became a frequent saying in medieval Buddhist texts. A chapter of Dōgen’s *Shōbōgenzō* quotes the enlightenment verse of Chinese poet Su Dongpo:

> The sounds of the valley streams are His long, broad tongue;
> The forms of the mountains are His pure body.
> At night I heard the myriad *sūtra*-verses uttered
> How can I relate to others what they say?
>
> (Cook 1989: vii)

For Dōgen, this verse provides one answer to the questions, ‘where is buddha?’, ‘what is buddha?’ and ‘how does he preach?’ The preaching of nonsentient beings, a frequent theme in Dōgen, is echoed earlier in the poetry of Saigyō. It expands Dōgen’s view of ‘expression’ (discussed in §1) to the world of nature. Whether the traditional Japanese love of nature preceded or succeeded the absolute significance accorded to the phenomenal world cannot be determined.

6 Theodicy and ethics

Japanese Buddhist treatments of theodicy and ethics also reveal ways in which Buddhism was transformed in Japan. Theodicy is meant here in Max Weber’s general sense of an explanation that make the injustices of life intelligible and accounts for evil in the world (see Weber, M.). In classical Indian thought, the notion of *karma* answers the problem of both moral and natural evil. Karmic retribution means that every deed or action has consequences and evil deeds bring about suffering. Suffering is not punishment by a God who is free to punish or not, but rather is an inevitable consequence of evil actions. There are accordingly practical reasons to avoid evil and do good. In early Indian thought the notion of *karma* entailed that of transmigration. *Karma* is, as it were, the momentum of our actions that propels us through *saṃsāra*, the continuous cycles of birth and death. This transmigration occurs through various lifetimes and life forms, mythologized as the six realms of hell, hungry ghosts, animals, fighting demons, humans and gods. The Buddha taught a way of liberation that is a release from transmigration and its cause, *karma*, whether good or evil (see Karma and rebirth, Indian conceptions of). In later Japanese Buddhist philosophy, attachment to self and the concomitant ignorance of the reality of no-self were stressed as the root cause of *saṃsāra*.

After Buddhism was introduced to Japan, people easily accepted the notion of karmic retribution but not the literal belief of rebirth as animals or lower life forms. Transmigration through the six realms of *saṃsāra* played a larger role in Japanese literature and theatre than in philosophical discussions, which focused more on the practical path to liberation. Good deeds were not the means to liberation; they did not, for example, ensure rebirth in the Pure Land, whether taken as the physical abode or spiritual state wherein final liberation is possible. Hōnen, and later Shinran in his *Tannishō(Lamenting the Deviations)* went so far as to state that: ‘If a good person attains birth in the Pure Land, how much more so the evil person’.

The apparent incompatibility between any notion of rebirth and the Indian Buddhist doctrine of no-self or no-soul was not an issue in traditional Japanese Buddhist thought. Moreover, even after the Japanese understood this doctrine they, like the Chinese, continued to believe in the spirits of ancestors who remain somehow present among the living. That folk belief has played a stronger role in everyday life and religious practices than has Buddhist doctrine. Logically, the disassociation of good deeds and liberation would seem to compromise the theodicy offered by the notion of karmic retribution, and ancestor veneration to compromise the doctrine of no substantial self which is the basis of compassion with all living beings. In effect, however, the compromises have meant little more than finding a middle course, or superimposing the two metaphysically incompatible beliefs. Belief in karmic retribution has encouraged the avoidance of deeds conventionally deemed evil, and thus supported conventional ethics; but karmic retribution does not entail any final resolution to misery. Only religious practice, whether conceived as self-power or other-power, holds out the prospect of final liberation, or at least the actualization of one’s inherent enlightenment. In the meantime, one is to do good and avoid evil; more specifically, one is to adhere to conventional Buddhist precepts such as not killing, stealing, lying and so on. Similarly, veneration of ancestral spirits, including Buddhist patriarchs, has encouraged a respect for tradition and social order, while non-ego has been extolled as the basis of right action in both Japanese Buddhism and Confucianism.

If we seek in Japanese Buddhist philosophy a coherent theory of ethics as a separate branch of philosophy, we find instead a variety of practical reasons; for a moral theory, we would have to refer to Confucianism (see Confucian philosophy, Japanese).

This general description receives closer definition in the views of Shinran and Dōgen. Dōgen's ethical views reflect both the penchant to practical reasoning and the transcendence of ethics in the realization of enlightenment. Dōgen's sermons to monks training under him admonish them to keep the precepts while recognizing that their content is relative to the situation. Ultimately, the practice of keeping precepts is subsumed into *zazen* or the practice of realization. Dōgen's more philosophical writings transform practical admonitions such as 'do good' and 'do no evil' into proclamations of the realized state: 'the non-production of evil, the performance of good'. Ultimately, both Dōgen and Shinran would have us transcend the duality of good and evil to manifest, through uncontrived actions, absolute non-dual reality or 'suchness', which is perfect as it is. There is no cause-effect relation between morality and enlightenment, and so the issue is not the situational relativity of morality but, once again, the problem that the absolute is not complete without its manifestation in the phenomenal. Here ethical issues would give way to the problem of inherent enlightenment. The contemporary interpreter D.T. Suzuki advocated Zen enlightenment as the solution and simply proclaimed it to be 'beyond good and evil' (Suzuki 1964). On the other hand, the idea of inherent enlightenment has come under attack in the 1990s as perpetuating the status quo of society and blinding Japanese Buddhism to the need for reform guided by a social ethics.

Buddhist philosophy, Korean

Buddhism was transmitted to the Korean peninsula from China in the middle of the fourth century AD. Korea at this time was divided into three kingdoms: Kokuryô, Paekche and Silla. Both Kokuryô and Paekche accepted Buddhism as a state religion immediately after it was introduced, to Kokuryô in 372 AD and to Paekche in 384 AD. However, it was not until two centuries later that Silla accepted Buddhism as a state religion. This was because Silla was the last of the three kingdoms to become established as a centralized power under the authority of one king.

It is not coincidental that Buddhism was accepted by these three states at the very same time that a strong kingship, independent of the aristocracy, was created. These newly established kingships needed a new ideology with which to rule, separate from the age-old shamanistic tradition which had been honored among the previous loose confederations of tribes. Buddhism fulfilled this need. It became a highly valued tool which kings used shrewdly, not only to provide their societies with a political ideology but to give them a foundation from which to build a viable system of ethics and philosophical thinking. Given this historical legacy, Korean Buddhism came to possess a feature which set it apart from the other East Asian traditions: it became 'state-protection' Buddhism. Although this was not a particularly sophisticated phenomenon on a philosophical level, this feature had a lasting influence on all aspects of Buddhist thought in Korea. In general, Korean Buddhism has followed a course of development more or less parallel to that of the greater East Asian context, although with notably closer ties to China than to Japan. There is no historical evidence which indicates any direct intellectual transmission from India, Buddhism's birthplace; rather, most of the philosophical development of Buddhism in Korea occurred as Korean monks travelled to China to study and obtain Buddhist texts which had either been written in or translated into Chinese. Despite such close ties to China, however, Korean Buddhism has developed its own identity, distinct from that of its progenitor.

Compared to Indian and Central Asian Buddhism, which developed along clear historical lines, the development of Buddhism in China was largely dependent on the personalities of individual monks, and was thus affected by such factors as their region of origination and the particular texts which they emphasized. Thus, in the process of assimilating Indian Buddhism, the Chinese created and developed a number of widely varying schools of Buddhist thought. In Korea, however, such a diverse number of philosophical traditions was never established. Rather, one of the distinct features of Korean Buddhism has been its preference for incorporating many different perspectives into a single, cohesive body of thought.

1 Three Kingdoms period (372-668 AD)

When Buddhism arrived on the Korean peninsula, Korea was in a period of transition, changing from loose tribal societies to states ruled by centralized kingships. Buddhism was strongly patronized by the kings, as it provided them with a valuable political ideology, but nevertheless it had to face the challenge of countering the indigenous belief system based firmly on shamanistic ritualism. In response to this challenge, certain Buddhist doctrines which tended to undermine animistic beliefs received special emphasis in Korea. An example of these is the doctrine of *karma*, which asserts the importance of ethical action by humans and denies the power of gods and spirits in shaping human destiny. However, Buddhism also resorted to the tactic of assimilation. The heavenly being Hanunim, a shamanistic deity, was absorbed into the Buddhist conception of heaven. Similarly, the indigenous shamanistic worship of mountains, earth deities and dragons all became integrated into the Buddhist religious system.

Only fragmentary bits of information are available concerning Buddhist philosophy during its early existence in Korea. As previously discussed, the development of Buddhist studies in Korea ran almost parallel to that in China. Both Mahāyāna schools, such as Tientai, Huayan and Dilun, as well as Hīnayāna schools, including Abhidharma and the Sarvāstivāda and Vinaya traditions, were introduced. However, it seems that Mādhyamika philosophy formed the mainstream of Buddhist doctrinal thought during this period. Names of Korean monks from the Kokuryô and Paekche kingdoms are often mentioned, particularly in Japanese records, as masters of Mādhyamika theory or as founders of the Sanron (in Chinese, Sanlun) school in Japan (the Sanlun school was based on the sinicized interpretation of the Indian Mādhyamika).

We can learn much about the Korean interpretation of Mādhyamika theory by investigating the contributions of Sûngnang, an eminent Korean monk. Although we have no exact record of his date of birth, according to the Biography of Fadu in the *Liang Gaosengzhuan (The Liang Biographies of the Eminent Monks)*, Sûngnang succeeded to the lineage after the Master Fadu passed away in 500 AD. Sûngnang's unique interpretations represented a turning point not only for Sanlun studies but for Chinese Buddhist studies as a whole. Through the decisive contributions of Sûngnang, Sanlun was established by Jizang (549-623 AD) as one of the major schools in Chinese Buddhist history. Sûngnang's own works have not been transmitted, but his philosophical ideas are cited throughout Jizang's writings.

During Sûngnang's time, Chinese Buddhist studies were divided into Northern/Abhidharma and Southern/Satyasiddhi. Sanlun was considered part of the Satyasiddhi school, whose doctrine was based on Abhidharma theory and centered around the Hīnayāna concept of the Four Noble Truths. Sûngnang, however, made a distinction between Satyasiddhi and Sanlun, and he demarcated a boundary between the Old and New Sanlun. He is best known for his two-truth theory, in which he distinguished between conventional and ultimate truth. In his view, these are not ontological truths, but represent rather a convenient pedagogical device for teachers. In discussions concerning truth, some say that it is existence, some say that it is nonexistence, others say that it is either existence or nonexistence, while still others say that it is neither existence nor nonexistence. Sûngnang claimed, however, that none of these statements represent the complete truth, but merely indicate one aspect of it. Thus, in his view, the two truths represent different expressions of the excellent teaching of the Middle Path.

For Sûngnang, the Middle Path was not a state situated between existence and nonexistence, or duality and non-duality. Rather, he saw it as consisting of three levels: on the first level, the existence of all beings is considered as conventional truth, and the emptiness of all things is regarded as ultimate truth. Here, emptiness is called ultimate truth in response to the followers of Abhidharma who advocated the existence of *dharmas*. On the second level, the existence and emptiness of the first level are both viewed as conventional truth while the denial of both is seen as ultimate truth. This is Sûngnang's rebuttal to the Satyasiddhi school, which admits the dualism of existence and emptiness, positing emptiness as ultimate truth. Finally, on the third and last level, it is recognized that both truths as well as all three levels, are merely teaching devices. Thus, the three gates or three levels are expounded only in order to realize the truth of not three. This non-acquisition of, and non-abiding in, one level or one truth is initially named the ultimate.

The structure of Sûngnang's theory indicates a process of continuing dialectics to a level of infinity. As such, it negates any fixed concepts which regard the ultimate as a state arrived at through progression. For Sûngnang and his followers, a highest level does not exist; rather, this dialectic method of denial continues endlessly. The ultimate truth, then, cannot be the ultimate; it is not an absolute reality. This is why Sûngnang asserted that the two-truth theory was not a principle but only a pedagogical tool. He showed clearly that it is not possible to verbalize or conceptualize about ultimate truth. Any attempt to do so will only bring one back to the level of conventional truth. This unique philosophy marked the beginning of the New Sanlun school and was elaborated on first by Zhouyong and then by Jizang, who finalized its ideas in the latter half of the sixth century.

2 Unified Silla period (668-935 AD)

This period was one of religious maturity and innovation; as such, it represented the culmination of Buddhist influence in Korea, both culturally and doctrinally. Buddhism fully blossomed and flourished at this time, reaching heights that it would never see again. On the one hand, influences from China were still felt, as new schools of thought were introduced by Silla monks returning from the Tang dynasty. On the other hand, Korean Buddhist scholarship by such eminent monks as Wônhyo (617-86) played an important role in the development of Chinese Buddhist thought as well. However, unlike the Tang tendency towards sectarianism, Unified Silla leaned towards a synthesis of various aspects of Buddhist thought into a type of interdenominational philosophy, the so-called *t'ong pulgyo*, or Buddhism of total interpenetration. The syncretic approach of Korean Buddhist philosophy can be best understood under the following headings: the reconciliation of doctrinal disputes, the Silla Hwaom School, the Silla Vijñānavāda School, and the introduction of Sôn (Chan) Buddhism from China.

3 Unified Silla period: reconciliation of doctrinal disputes

One of the most important proponents of this syncretic approach was the noted monk and scholar Wônhyo. In his view, the various disputes which arose among Buddhist scholars were similar to the story of the blind men's description of an elephant: each man was only defining one aspect of the animal. In one sense, they were all wrong, because each failed to fully describe the elephant. In another sense, however, they were not entirely wrong, as what they were describing was not something other than the elephant.

Wônhyo was not interested in merely partial or incomplete understandings, however; rather, he focused on integrating a variety of doctrines into one complete view, as seen from a higher perspective. This view has been termed *hwajaeng*, or the 'reconciliation of doctrinal controversy'. The hermeneutical device used in this doctrinal reconciliation is well represented in his unique genre of Buddhist commentarial work, *chong-yo*, as well as in his concepts of *kae* (unfolding or opening) and *hap* (folding or sealing) the truth. Wônhyo is believed to have composed approximately seventeen of these *chong-yo*, of which only five are extant. *Chong* translates as doctrine or theme, and *yo* means essence. Thus, for example, one of his works, the *Yolban'gyong chongyo*, translates as the 'Doctrinal Essentials of the Nirvāṇa Sutra'. Here, 'doctrine' refers to the various ideas which are discussed, and 'essentials' integrates them into one primary framework of thought. Similarly, by his usage of the word 'unfolding' (*kae*), Wônhyo indicates a variety of ideas and analyses, while through 'folding' (*hap*) he denotes how these themes may be synthesized into one cohesive unit of understanding. Doctrine, then, reflects the unfolding of the one into the many, whereas essence refers to the folding of the many back into the one.

Another device which Wônhyo used in order to reconcile opposites and thus denote their non-duality was his theory of essence-function (Korean: *ch'e-yong*) (see Ti and yong). In his *Taesung kisillon so (Treatise on Awakening Mahāyāna Faith)* he asserts that Mahāyāna is a synonym for One-Mind. This One-Mind represents essence, or *ch'e*, while the variety of mental and physical states, or the arising of *dharmas*, represents function, or *yong*. In terms of its internal logic, essence-function is no different from the *kae-hap* (folding and unfolding) formulation. According to Wônhyo, when the essence of Mahāyāna, or One-Mind, is unfolded, immeasurable and limitless meaning can be found in its doctrine. Conversely, when the doctrine is folded, it returns to its essence, which consists of two aspects: the absolute and the phenomenal. The limitless meanings of One-Mind are identical to this essence and are completely amalgamated within it. Therefore, One-Mind unfolds and folds freely, and establishes and refutes without restrictions.

In this way, the myriads of sensory impressions are brought to a permanent end and return to the source of One-Mind. Thus, there is nothing that is not advocated and nothing that is not refuted. Wônhyo calls the advocacy concession or acceptance (*hwanho*), and he labels the refutation variously as deprivation (*t'al*), negation (*kyon*), return (*wang*) or prohibition (*purho*).

Wônhyo was particularly concerned with using his hermeneutic tools to reconcile the Mādhyamika and Yogācāra doctrines. In his view, Nāgārjuna's *Mūlamadhyamakaśāstra* and *Dvādaśanikāyaśāstra* offer a thorough dialectic critique of all views which a person might advocate, to the extent that they abolish both the views refuted and the act of refutation (see Nāgārjuna). However, because Mādhyamika dialectics do not affirmatively acknowledge both the subject and object of this refutation, the approach is purely negative, and thus nothing is established. On the other hand, the Yogācāra school accomplishes a thorough analysis of all mental states and accordingly establishes both the shallow and profound teachings. However, because the Yogācārins do not continue on to refute what they have established, theirs is a purely positive approach, and thus, nothing is refuted. Doctrinal controversy arose between the two schools due to the fact that the Mādhyamikas attached to refutation and deprivation, whereas the Yogācārins attached to establishment and acceptance. Each recognized only a part of the truth; although neither was entirely wrong, at the same time neither was altogether correct.

Wônhyo was able, based on his unique usage of unfolding and folding, to reconcile these differences by including them into a single Buddhist teaching, that of One-Mind, which allows for both affirmation and negation. According to Wônhyo, the *Taesung kisillon*, a noted Mahāyāna text upon which he based his well-known commentary, is a syncretic work which embraces the positions of both Mādhyamika and Yogācāra (see Awakening of faith in Mahāyāna). He asserts that while it refutes all relative views (as represented by the two above-mentioned schools), it also embraces them comprehensively within the all-encompassing One-Mind.

4 Unified Silla period: Silla Hwaôm school

Another vital contribution to Korean Buddhist thought was made by Ûisang (625-702), who was a contemporary of Wônhyo and is known as the founder of the Korean Hwaôm school (Huayan in Chinese) based on the *Avatāmsaka Sūtra*. Unlike Wônhyo, who had never been to China, Ûisang spent almost ten years there and studied under Zhiyan (602-68), the second patriarch of the Chinese Huayan school. The *Hwaôm ilsung popke to (Diagram of the Dharmadhātu of the One Vehicle of Hwaôm)* is Ûisang's only major extant work, and is comprised of his *Haein sammae to (Diagram of Ocean Seal Samādhi)* and an autocommentary.

The *Ocean Seal*, as it is commonly known, written while Ûisang was in China, is a poem consisting of 210 characters. It opens with the word *pop* (*dharma*) and closes with *pul* (Buddha), thus signifying the cause-and-effect relationship between the two. By placing both of these characters in the centre of a diagram in the form of a maze, Ûisang articulated the basic theme of Hwaom philosophy which asserts that beginning and end, or cause and effect, occupy the same position while still retaining their own distinctive characteristics. In this way, he depicted Hwaôm philosophy as a mystery of simultaneous mutual penetration. In addition, he pointed to the Hwaôm soteriological position that within the fifty-two stages of a *bodhisattva*'s career, the first stage of initial faith itself embodies all fifty-two stages, including the final stage of marvellous enlightenment. Of this position, a well-known Hwaôm aphorism states, 'The moment one arouses an enlightenment thought (*bodhicitta*), instantly perfect enlightenment is attained.'

Although Ûisang's expression of Hwaôm theory in the *Ocean Seal* was not his own creation, it succeeded in ably representing the main ideas of the school, both symbolically and graphically. The *Ocean Seal* is traditionally presented to monks upon completion of their course of study, a mark of how highly esteemed it is in the Korean Buddhist tradition. It is also chanted in Korean Buddhist ceremonies as a *dhāranī*, having been endowed with a special mantric power. Along with Wônhyo's philosophy of the reconciliation of opposites, Ûisang's contributions to Hwaôm theory helped to create the Korean tradition of *t'ong pulgyo* and provided the foundation for the synthesis of the doctrinal or scriptural schools (Kyo) and the meditational schools (Sôn) by Chinul in the following Koryô dynasty.

5 Unified Silla period: Silla Vijñānavāda school

There were actually three different systems of Yogācāra (or Mind-Only) philosophy which were transmitted into Korea from China during the Unified Silla period. The first can actually be traced back to the Three Kingdoms period, when Won'gwang (d. 630) returned to Korea after studying the *Mahāyānasanùgraha* (in Chinese, *Shelun*) in China. However, it was not until Wônch'ūk (612-96) arrived on the scene that any significant study of Yogācāra was undertaken in Korea. Wônch'ūk is considered the major figure among Silla monks studying Yogācāra doctrine. His system is classified as the Old Yogācāra, founded by the Indian monk Paramārtha (499-569). This is in order to distinguish it from the New Yogācāra, which was founded by the Chinese monk Xuanzang (602-64). Xuanzang translated Dharmapāla's *Vijñāptimātratāsiddhi* into Chinese and his new school, which was established on the basis of this text, became known as the Faxiang (Dharma Characteristics) school.

The two Yogācāra schools, Old and New, differed in their theoretical approaches and there were conflicts between them. Wônch'ūk and his disciples eventually established their own school, called the Ximing school. This was followed by the Silla Vijñānavāda school, which included such noted monks as Tojung and T'aehyon. Vijñānavāda theory in Silla developed its own unique characteristics quite distinct from those of Xuanzang's school in China. The Silla school not only effected a synthesis of the various Vijñānavāda schools in China, but it also adopted theories from other Chinese schools, such as Tientai and Huayan. It achieved this synthesis through its understanding of the term 'One Vehicle', an approach made possible by the work of Wônhyo. Like Wônhyo, the Silla Vijñānavāda school attempted to reconcile the teaching of Mādhyamika with that of Yogācāra, but by using the concept of one sound as its reference point. Here, Wônch'ūk was referring to the Buddha's teaching, which has one meaning but is given different explanations depending on one's level of understanding. Wônch'ūk's concept of 'one sound' is, of course, comparable to the concept of the One Vehicle, as both are nothing but teaching devices used to comprehend various understandings from a higher vantage point.

6 Unified Silla period: introduction of Sôn

A new epoch occurred in Korean Buddhism upon the transmission of Sôn (Chan) Buddhism from China. This new movement, with its strong emphasis on meditational practice, entered Korea not long after it was introduced into

China. According to traditional accounts, it was Pômnang (*fl.* 632-46) who first introduced Chan Buddhism to Korea, following his study under Daoxin (580-651), the fourth patriarch of the Chinese Chan school. His lineage was passed down through Sinhaeng, Chunbôm and Hyeûn until it reached Chisôn Tohon (824-82), who founded the Mount Huiyang school, the oldest Sôn lineage in Korea, in 879. Within a hundred-year period, from the eighth to the ninth centuries, eight other mountain schools were founded. From this time onwards, the term Nine Mountains has come to represent Korean Sôn schools in general, and this number remained unchanged during the early Koryô period.

In contrast to the Chinese Chan schools, which were categorized as the Five Schools and Seven Orders and which maintained sharp sectarian distinctions, the Korean Nine Mountain schools were classified according to the identities of their founders. Only a monk who had originally studied in China was entitled to be the founder of a new school. Furthermore, in the Korean tradition, the relation between teacher and disciple was considered more important than the philosophical doctrine espoused. This differed sharply from the Chinese Chan tradition, in which lineage affiliation was based directly on doctrine. The Korean approach was to regard what they called the Five Schools and Seven Orders not as different schools, but rather as different families of the same school. For this reason, the Nine Mountain schools, regardless of their founders, were all considered to belong to the Chogye order. The name Chogye (in Chinese, Zaoxi) was taken from the mountain associated with Huineng, who was regard as the progenitor of Chan before its division into five schools and seven orders.

Eight of Korea’s nine mountain schools (the exception was the Mount Sumi school) were derived from or related to the Chinese Hongzhou school. As noted by Zongmi (780-841), the noted Chinese Buddhist commentator and philosopher, the Hongzhou school had a close doctrinal affiliation with Huayan. Most of the Korean monks who came to China to study Buddhism were already familiar with Hwaôm philosophy, as it was the predominant school in Korea at that time. Therefore it is not surprising that they were attracted to the Hongzhou school. However, the fundamental difference between Huayan and Chan must not be overlooked: while the former emphasizes scriptural study, the latter rejects it, choosing rather to espouse ‘a separate transmission outside the scriptures’. This crucial difference may also have attracted the Silla monks, who were perhaps frustrated with the philosophically elaborate and priest-centred Hwaôm school.

Immediately upon Sôn’s introduction to Unified Silla, an antagonistic tension was created between the new Sôn and the old doctrinal schools, particularly Hwaôm. Sôn masters perceived the scripture-based Hwaôm school as antithetical to their practice-oriented mission. Later, however, they altered their approach in an effort to synthesize the messages of the two schools.

7 Koryô period (918-1392): parallel cultivation of doctrinal study and contemplation

Upon the collapse of the Silla dynasty, the Korean peninsula reverted back to three kingdoms, until King T’aejo unified the country and subsequently founded the Koryô dynasty. Under the Koryô, Buddhism was fully supported not only by the royal family but by the entire apparatus of the Korean government. The price, however, was tight government control.

Despite these controls, discord between the radical Sôn schools and the more conservative doctrinal proponents continued, and it was not till Ûich’ôn (1055-1101) that a serious attempt was made to reconcile these conflicts. Although his background was in Hwaôm, Ûich’ôn studied various schools of Buddhist thought throughout his career. Most notably, he travelled to China in 1085 and studied with renowned teachers of the Huayan, Tientai, Pure Land, Vinaya and Chan sects there. Upon returning to Korea, he attempted to incorporate Sôn into the system of Tientai (in Korean, Ch’ônt’ae). He felt that meditation was essential not only for followers of Sôn but for members of all Buddhist schools, and he criticized the polarization of the two approaches, doctrinal and meditational. From his perspective, which favoured scriptural study yet also emphasized meditational practice, although *dharma* is devoid of words and appearances, it is not separate from them. Similarly, doctrinal study and meditation do not oppose each other but should be seen as complements; each is a requisite tool for the attainment of awakening.

Yet Ûich’ôn was unable to accept the radical doctrine of the Sôn of his time. He acknowledged the validity of Sôn only on the condition that it remained based on scriptural teachings. For him, the Sôn dictum of ‘transmission outside the scriptures’ was not acceptable as a valid Buddhist teaching. He believed that the practitioners of his

time, by abandoning the scriptures, were veering dangerously towards heresy. He felt that his own *kyogwan kyomsu*, or 'parallel cultivation of doctrinal study and contemplation', was the correct approach. Viewing the system of Ch'ônt'ae as one which harmonized Sôn and scriptural study, Ûich'ôn attempted to consolidate the Sôn school into the Ch'ônt'ae order. However, he was unable to accomplish this, thanks not only to his early death, but also to of his narrow understanding of Sôn.

It was Chinul (1158-1210) who effectively assimilated Sôn into the mainstream Korean Buddhist tradition, if not in its entirety, at least in the area of doctrine. Chinul lived during one of the most difficult times in the history of Koryô Buddhism. Having become dependent on the support of the government, Koryô Buddhism had lost most, if not all, of its earlier spiritual vitality; corruption was at its peak and discipline in the monasteries was increasingly lax. Chinul perceived the Buddhism of his day as subject to 'ten kinds of disease', and his endeavours to effect a rapprochement between the Sôn and doctrinal schools were founded on his deep concern about this decline.

If Wônhyo's philosophy of harmonization was aimed at ending the doctrinal disputes among the various schools, Chinul's intent was to provide a theoretical scheme for harmonizing Sôn with the scriptural schools, and to offer a radical approach to the issue of final enlightenment based on the doctrinal teachings of Mahāyāna. He attempted ultimately to provide a systematic, theoretical framework which would incorporate both theory and experience. Being a Sôn monk, he was deeply aware that only through one's own experience can one attain final, ultimate liberation. The primary value of his theory, then, was that it clearly displayed an understanding of the necessity of practice.

Unlike Ûich'ôn, whose viewpoint was rooted in the doctrinal teachings, Chinul's foundation was in Sôn. His syncretic vision was therefore to establish a new Sôn school which would incorporate not only various teachings of the traditional Chan schools in China, but various doctrinal teachings as well. His primary intent was to systematize a comprehensive soteriological scheme for Sôn which would be pertinent to practitioners of various levels of capacity. He was inspired in this task by the great Chinese Buddhist thinker Zongmi, a patriarch of both the Huayan and the Heze school of Chan. Chinul, deeply frustrated with the deterioration of Sôn in his time, was especially attracted by the balanced approach of the Heze school, which encompassed both the intellectual understanding of the scriptural teachings and the radical, anti-intellectual spirit of Chan. Chinul's soteriological scheme of sudden enlightenment followed by gradual self-cultivation reflects the Heze approach.

In an inscription written by Kunsu Kim (*fl.* 1216-20), it is said that Chinul established three main approaches to Sôn practice, directly reflecting his own enlightenment experiences: the balanced practice of meditation and wisdom, inspired by the *Platform Sutra* (see Platform Sutra); faith and understanding according to the complete and sudden teachings, inspired by the Li Tongxuan's *Exposition of the Huayanjing* (*Avatamsaka Sūtra*); and finally, the shortcut approach of *hwadu* (in Chinese, *huatou*) investigation. We can elucidate Chinul's philosophical system by examining these three approaches.

8 Koryô period: balanced cultivation of meditation and wisdom

In his *Susim kyol (Secrets on Cultivating the Mind)*, Chinul elucidates a method for cultivating the mind after a sudden, initial enlightenment experience. According to him, sudden enlightenment represents a realization of the nature of true mind as having two aspects: voidness and calmness in its essence, and numinous awareness in its function. These in turn correspond to the two aspects of *dharma*, immutability and adaptability. Mind is in its essence originally void and calm, and yet at the same time it adapts freely in infinite ways, depending on one's level of consciousness. Thus if one's consciousness is deluded, Mind appears ignorant, while if it is awakened, Mind manifests a numinous awareness.

In Chinul's system, gradual practice should follow after the sudden, initial awakening to the nature of True Mind. Chinul correlates the essence and function of Mind with meditation (*samādhi*) and wisdom (*prajñā*), respectively: in the task of cultivation, meditation is the essence and wisdom is the function of Mind; they are inseparable, nondual aspects of the same thing. This dynamic concept of the interrelationship of meditation and wisdom further entails that in cultivating Mind one should be alert in the void and calm mental state, and calm in the state of numinous awareness: calm and alertness represent meditation and wisdom, which are inseparable and nondual, and thus must be practiced simultaneously in cultivation.

Even if one attains a sudden awakening to the nature of Mind and thus realizes the identity of meditation and

wisdom, the balanced cultivation of meditation and wisdom is still important: due to the residue of defilements and the karmic force deriving from long-standing habits, one's mind-nature does not always have its original harmony. The two nondual, inseparable aspects of mind, essence and function, can become bifurcated, as if they were two different, separate entities. An excess of essence can produce too much calmness, which in turn leads to dullness, while an excess of function can produce over-alertness, thereby easily causing distraction.

Since Chinul follows the sudden approach to enlightenment, in which enlightenment precedes cultivation, his interpretation of meditation and *samādhi* as essence and function differs from that of the gradual school of Sôn. In the latter, where practices are centred on the gradual removal of defilements in order to achieve perfect Buddhahood, meditation is used to counter the defilements in the conditioned realm, and wisdom is used thereafter to counter discriminative thinking. These two different methods are intended to ultimately achieve a penetrating insight into the nature of reality. However, although Chinul does not exclude the possibility that the gradual approach to meditation and wisdom may be used as an expedient means for counteracting defilements, he felt it should be allowed only after the experience of sudden awakening. In fact, Chinul urges that at all levels of practice, as well as at all stages of a practitioner's development, both meditation and wisdom should be combined, just as the principle of balance, that is, of calmness and alertness, must be maintained in order to access the enlightenment experience.

9 Koryô period: faith and understanding according to the complete and sudden teaching

More often than not, the doctrinal teachings based on scriptures were considered by Sôn masters as a grave fallacy, an impediment to attaining final enlightenment. From their perspective, this is especially true because the conceptual or discriminatory nature of doctrinal teachings cannot invoke the Absolute, which is ineffable. On the other hand, Hwaôm, as one of the doctrinal schools, considered Sôn as merely representing the sudden teaching, which they considered a lesser teaching than the final, complete doctrine of Hwaôm. These two main branches of Mahāyāna Buddhism thus seemed to contradict each other, not only in terms of doctrinal framework, but also in their soteriological schemes.

Chinul believed that Sôn and Hwaôm were not necessarily contradictory, but could serve to complement each other. He felt that the conceptual framework of Hwaôm could help to enhance practitioners' understanding, especially those with a lesser capacity, of the mind-to-mind transmission of the esoteric teachings of Sôn. He was especially concerned about the Sôn practitioners of his time, whom he felt had strayed from correct practice due to their lack of a proper understanding of scriptural teachings. He feared that they were meditating in a state of ignorance and thus in vain. Chinul felt that proper guidance in the scriptural teachings was necessary for them to achieve final enlightenment

However, it was not an easy task to synthesize the two, thanks to their different orientations. Hwaôm philosophy systemized the path to enlightenment into fifty-two stages, beginning with the ten levels of faith and ending with the stage of Buddhahood. Often a temporal scheme was assumed, such as a period of three incalculable aeons, or more than several lives, from the initial stage of faith to the final attainment of Buddhahood. Within this progressive scheme, Hwaôm soteriology postulated a process of learning, practice and realization, in which each stage proceeds sequentially in a causal relationship. Chinul thus incorporated the soteriology of Hwaôm, which assumes a progressive development within a temporal scheme, into the sudden teaching approach of Sôn. It was in Li Tongxuan's *Exposition of the Avatamsaka Sutra* that he found a means of incorporating the two systems into a viable soteriological scheme.

Inspired by Li Tongxuan's unique interpretation of the Huayan soteriological structure, and recapitulating the latter's essential message, Chinul was able to propose, as another possible approach to Sôn practice, the method of faith and understanding as detailed in his *Wondon Songbullon (Complete and Sudden Attainment of Buddhahood)*. Chinul noted that unmoving wisdom, or the wisdom of universal brightness, is essentially identical with the deluded mind. Through a sudden awakening to this essential identity, one can enter directly the initial abiding stage, the stage of the arising of *bodhicitta*, in which one may directly experience the fact that one is a Buddha. From this stage onward, the subsequent stages of the *bodhisattva* path can be instantly achieved because of the functioning of inherent Buddhahood. Such a soteriological structure is possible due to the fact that unmoving wisdom is not merely a fruit to be attained at the final stage, but also a cause for the final attainment of buddhahood. Moreover, from the initial stage of faith to the final attainment of buddhahood, it is the unmoving

wisdom of Buddha which operates unceasingly.

10 Koryô period: shortcut approach of *hwadu* investigation

Although Chinul incorporated the theoretical framework of Hwaôm into Sôn practice, he did not forget to indicate that theories and conceptual frameworks need to be abandoned at a certain stage. In their place, Chinul proposed his method of *hwadu* investigation, which is like a finger pointing to the moon.

Chinul never lost sight of the fact that the goal of Sôn practice is to transcend conceptual understanding, thus leaving behind all discriminatory thoughts. As a means of achieving this goal Chinul found the investigation of *hwadu* most effective, a method, which in his words, cuts through iron and split nails.

Hwadu is often considered a synonym for *kongan* (in Chinese, *gongan*). More precisely, however, the *hwadu* is the essential point of the *kongan*, which is used as a topic of meditation in the Sôn school. The purpose of *hwadu* investigation is to help practitioners break through views based on their conceptual understanding of the *dharma* and to ultimately return them to the source of all discriminative thought. Thus, Chinul referred to the function of the *hwadu* as one of cleansing knowledge and understanding.

The *hwadu* method is also called the shortcut approach, as it involves no conceptual descriptions but rather points one directly to the truth right from the inception of practice. In his *Kanhwa Kyorui Ron (Resolving Doubts About Observing the Hwadu)*, Chinul discusses the three mystery gates, or three different methods, differentiated according to one’s capacity for attaining the ultimate teaching of the Sôn school: (1) the mystery of essence, which involves the conceptual understanding of the Buddha-*dharma*, such as the doctrine of the unimpeded interpenetration of all phenomena of the Hwaôm school; (2) the mystery of the word, which helps one eliminate the defects of conceptual understanding and ultimately destroy it; and (3) the mystery of mystery, in which practitioners abandon the interpretive analytical approach altogether and investigate the word itself. This method transcends any trace of a sign which a word may signify and finally results in the awareness of the noumenal state, that is, the void and calm state of mind.

In making *hwadu* the cardinal approach of Sôn practice, Chinul was influenced by Dahui Zonggao (1089-1163), a disciple of Yuanwu Gejin of the Linji school in China. Inspired by the *Dahui yulu (The Records of Dahui)*, Chinul was the first Korean Sôn master to introduce the *hwadu* into Korean Sôn practice. *Hwadu* became a hallmark of Korean Sôn and, combined with the concurrent cultivation of meditation and wisdom, and the doctrine of sudden awakening and gradual practice, represents the essence of Korean Sôn.

In summary, Chinul systematized a Korean approach to Sôn practice which stood apart from all other schemes. Its uniqueness lay in the fact that it synthesized the doctrinal teachings into Sôn practice, provided a theoretical framework for Sôn practice, and maintained the fundamental spirit of Sôn teaching by postulating *hwadu* investigation as a shortcut to the final attainment of enlightenment. With only slight variations through the ages, this structure has been maintained by Korean Sôn practitioners ever since.

After Chinul’s time, Koryô Buddhism began to gradually decline. This was primarily due to the political instability of the Koryô court after the Mongol invasion, but it was caused in part by the corruption of the Buddhist monasteries and monks. However, there were still contributions made by such monks as Kyônghan Paegun (1290-1374), T’aego Pou (1301-82) and Naong Hyegûn (1320-76), who tried to restore the strength of Buddhism in the latter Koryô. All three had returned from Yuan China after studying under the Linji (in Korean, Imje) school, which places a strong emphasis on *hwadu* practice. The most radical and confrontational methods of the Linji school became very popular in Korea and had a great impact on Korean Sôn practice. However, due to the general social instability of the times, there was insufficient support for a sustained reinvigoration of Buddhism.

In this period of decline the Korean literati, whose official education was grounded in neo-Confucian philosophy, succeeded in supplanting Buddhism as a state-sponsored ideology (see Confucian philosophy, Korean). Chinese philosophies, such as Daoism and neo-Confucianism, became increasingly influential, and monks like Kyônghan and Naong began to study these schools of thought. This represents the beginning of another unique trend in Korean Buddhism, as monks began to emphasize the study of non-Buddhist philosophies. Korea became more and more Confucianized, first in a political sense and later throughout society as a whole. This move toward Confucianism began gradually in the latter period of Koryô and accelerated with the beginning of the Chosôn

dynasty, which was founded in 1392.

11 Chosôn period (1392-1910)

The Chosôn dynasty was founded on the basis of neo-Confucianism, which combined a strong political ideology with a practical ethics emphasizing the importance of the family. Neo-Confucianism was strongly antagonistic towards Buddhism, as Buddhist monks left their families and maintained strict celibacy. During the Chosôn dynasty Buddhism was not only suppressed by those in political power but also largely ignored by intellectuals. In terms of social stratification, monks were ranked in the same class as the servants and were not allowed to enter the capital city. Amidst such harsh circumstances, Buddhism became completely marginalized.

The Buddhists of this period used their adverse circumstances as an opportunity to systematize a harmonized perspective which reconciled the philosophical conflicts among neo-Confucianism, Buddhism and Daoism (the three systems were often called *samgyo* or the Three Religions.) This synthesis in turn served once again to set Korean Buddhism apart as a unique system of thought.

Kihwa (1376-1433), otherwise known as Hamhô Tûkt'ong, continued the syncretic view of Korean Sôn systematized by Chinul, and was also the first Buddhist monk to advocate Buddhism against the neo-Confucian attack. He was also the first Buddhist monk to assert the intrinsic unity of the three religions, Buddhism, Confucianism and Daoism. Kihwa's life and times are reflected in his philosophical system. He was a prolific writer of Buddhist exegeses, in which he freely used Confucian concepts as well as citations from Confucian texts in order to clarify Buddhist ideas: he saw Buddhism and Confucianism as supplementary and not contradictory systems. He objected not only to the exclusivist attitude of Sôn practitioners toward the doctrinal schools, but also of Confucianism toward Buddhism. Before he studied Buddhism he was educated, like most sons from upperclass families, in the Confucian classics. He often used poetry, both from his own pen and from the classics, as a means of elucidating Buddhist texts (see Chinese Classics).

His syncretic approach is well demonstrated in his *Hyônjông non (Treatise on Manifesting Righteousness)*. In this apologetic essay on the unity of Buddhism and Confucianism, he not only defends Buddhism using the language of Confucians, but he goes one step further and advocates Buddhism using scriptural evidence from the Confucian classics. In this treatise, Kihwa identifies the various mental functions, which he termed usually as the arising of *dharma*, with emotions, often described as the obstruction of the true nature of mind in neo-Confucianism. In so doing, he is pointing out the similarities between Buddhism and Confucianism in the sense that both attempt to eliminate the arising of *dharma* or obstructions of the mind so that the true nature will be manifested. Buddhists call this the 'enlightened state', while Confucians call it 'being a saint'. Kihwa stressed that in terms of the final goal there is no discrepancy between them, and in fact there exists an intrinsic unity between the two. Further, as the title *Treatise on Manifesting Righteousness* implies, Kihwa saw that both ultimately reveal the truth. He also demonstrated that Buddhist cultivation does not differ from the Confucian principle of cultivating the mind, step by step, beginning with cultivation of the personal life, continuing with regulation of the family and national order, and finally ending with world peace (see Daxue). Moreover, he claimed that the Buddhist teaching allowed people to pursue different levels of practice according to their capacity, from the *bodhisattva* path to the merit-making of ordinary people. With this, Kihwa intended to demonstrate the superiority of the Buddhist teaching, which in his view embraces a universality that includes all kinds of people, in contrast to the soteriology of Confucianism, which is often limited to the highly educated.

Regarding the social aspect of the two systems, Confucianism was often considered to be superior to Buddhism. Kihwa believed otherwise. He felt that the Confucian system, by using tactics of reward and punishment in governing the people, enforced a mere superficial obedience. In contrast, as Buddhism based its teachings on the law of cause and effect, and as it further propagated the value of silence through meditation, it promoted a more spontaneous response.

Kihwa also developed the issue of social ethics, including filial piety, the most important aspect of Confucian ethics, into the greater context of truth itself, which he termed *to* (in Chinese, *dao*), or the Way. He defined the Buddhist perspective of the truth, the Way, as consisting of two aspects, the unchangeable principle and temporary expediency. According to him, only by both maintaining principle and adapting to change through the use of expedients can one achieve completion of the Way. However, the formalistic and family-centred ethics of

Confucianism cannot achieve both of these goals. Similary, he felt that one who is still subject to passions is not able to be loyal to the state and, at same time, to be filial at home. Only when one becomes free from one's own passions and conceptual boundaries can one extend oneself to universal altruism, as represented in the Confucian concept of humanity, *in* (in Chinese, *ren*), or the great compassion of Buddhism. Residing in the mountains away from home is neither unfilial nor disloyal, but is a greater form of filial piety and loyalty to the state, unimpeded by any particular phenonema. The Buddhist aim of achieving an unimpeded state between principle and phenomena, as well as among phenomena, was focused not on leaving society or the world, but rather on realizing the perfection of society.

Unlike the fourth and fifth century Chinese apologetic defenses of Buddhism, Kihwa defended Buddhism more positively and often advocated its superiority. However, before he became a Buddhist he was well known as a promising young Confucian scholar. One of his biographical accounts tells us that his interest in Buddhism was motivated by the sudden death of a friend, and also by a monk who questioned him about the Confucian practice of encouraging people to serve their parents meat, yet espousing universal affection toward all living beings. As this account illustrates, his spiritual and intellectual quest was more concerned with ontological and soteriological issues. Although he seems to have found some insight through Sôn meditation, his quest did not stop there, but further impelled him to discern an intrinsic unity among the various philosophical and religious teachings of his time. His pseudonym was Tûkt'ong, which means attainment of interpenetration; it is an apt title, as he diligently pursued this goal not merely in regard to Sôn and the Buddhist doctrinal teachings, but also in connection to all the existing teachings of his time. Dismissing the question as to which of the three teachings, Confucianism, Buddhism or Daoism, was superior, he instead felt that they were intrinsically identical. For Kihwa, the Daoist teachings of non-action and the Confucian teachings of being responsive but always calm were no different from the teaching of Sôn Buddhism, which espouses being: 'Calm but always illuminating; illuminating but always calm.'

Wônhyo's synthesis of the various doctrinal disputes was succeeded and developed by Chinul's syncretic view attesting to the unity of Sôn and scriptural teaching; this in turn was followed by Kihwa's harmonization of the three religious teachings. This tradition of the syncretic perspective in Korean Buddhism was further developed by Hyujông (1520-1604), known as Sôsan Taesa (Great Master of the Western Mountain) (see Sôsan Hyujông).

Hyujông was not only the central Buddhist figure during the Chosôn period, but also one of the most influential figures in the entire history of Korean Buddhism. He not only continued to propagate the syncretic perspective of the unity of Sôn and doctrinal teachings as formulated by Chinul, but he also attempted to reconcile the three teachings in terms of their ultimate message of truth.

By Hyujông's time, the various doctrinal schools had been reconfigured into one unified school, called Kyo, or scriptural teaching, while the Sôn schools were categorized under the single, unified name of Sôn. The conflict between Sôn and the doctrinal teachings still existed as an active point of controversy among Korean monks. As the titles of his major works, such as *Sôn'ga kwigam (The Mirror of the Sôn school), Sôn'gyo sôk (An Interpretation of Sôn and Kyo)* and *Sôn'gyo kyôl (The Secret on Sôn and Kyo)*, illustrate, Hyujông's major concern was to reconcile Sôn and the scriptural teachings by incorporating the doctrinal schools into Sôn. While generally agreeing with Chinul's syncretic teachings, Hyujông contrasted Sôn practice more sharply with Kyo and ultimately espoused Sôn's supremacy. He felt that since the intrinsic unity of Sôn and Kyo had already been clarified by the efforts of Chinul, his mission was not to reassert this point, but rather to establish a correct relationship between the two in terms of the means of attaining ultimate enlightenment.

According to Hyujông, the source of both Sôn and Kyo are the Buddha, but one refers to his mind and the other to his words. Regarding the relation between Sôn and Kyo, he asserted that Kyo is what reaches wordlessness from the word, while Sôn is what reaches wordlessness from wordlessness itself. Wordlessness means here the true nature of mind or the enlightenment state which cannot be reached through any verbal, logical description. By saying that both Kyo and Sôn reach wordlessness, however, Hyujông did not mean that one can reach the ultimate state through Kyo. Rather, he meant that Kyo, beginning with the word (that is, scriptural teaching), should be applied and then continued ultimately for the purpose of attaining the state of wordlessness. In other words, one may begin practice by studying Kyo, but in the process of attaining enlightenment, Kyo must be discarded and Sôn must be practised. This relation between Sôn and Kyo is well elaborated in his theory of *sagyo ipson*, the principle of abandoning Kyo and entering Sôn, which is still followed in present day Korean Buddhism. In this way,

Hyujông acknowledged the efficacy of Kyo as a part of Buddhist practice, yet he also asserted the supremacy of Sôn practice by postulating the limitations of intellectual understanding. Thus, he refused to recognize the possibility of attaining enlightenment through the use of Kyo alone. Of course, not every practitioner needs to follow both Kyo and Sôn practices successively. According to Hyujông, the person of high capacity may not find it necessary to follow both practices, but the person of middle or low capacity cannot omit doctrinal study, Kyo.

In his other work, *Samga Kwigam (Mirror of the Three Teachings)*, Hyujông's purpose was to demonstrate that all of the three East Asian intellectual traditions, Confucianism, Buddhism and Daoism, ultimately lead to the truth, *to*, or the Way. The intrinsic unity of the three teachings was first expostulated by his predecessor, Kihwa. However, while Kihwa's approach can be said to incorporate Confucianism and Daoism into Buddhism, especially Sôn Buddhism, and thus ultimately to advocate the superior position of the Buddhist teaching, Hyujông's approach was different. He shows us the core or the essentials of the three teachings, and by doing so he reveals the similarities among the three, although he does not ignore their differences. He felt that to espouse the superiority of one teaching over another was to be guilty of sectarianism. In interpreting each teaching of the three religions, he used a higher perspective to reconcile their minor differences into the greater context of their intrinsic unity. His approach, the synthesis of discrepancies into a higher perspective, immediately reminds one of Wônhyo's method of *kae* (unfolding) and *hap* (folding): by unfolding discrepancies, the various functions of the truth are displayed, and by folding them, the discrepancies are reconciled into the essence of the truth itself. In the epilogue of the *Samga Kwigam*, he mentions that his intention is to provide a communication channel while overcoming the limits of sectarian views. He called the three teachings 'three gates', indicating his perception of them as different means of attaining the ultimate goal. This goal, which is the realization of the ultimate truth, has often been termed *to*, or the Way, in the East Asian tradition, and carries no sectarian connotation. To realize this *to*, one's mind-eye, or wisdom, is the key. Hyujông's all-inclusive spirit, which perpetuates the long syncretic tradition of Korean religious thought, continues to have a great impact on contemporary Korean Buddhism.

12 Conclusion

Since Buddhism was introduced into the Korean peninsula during the latter half of the fourth century, Korean Buddhism has undergone three major paradigm shifts. The first occurred as a response to Korea's indigenous belief system, which may be characterized as shamanistic animism; this period extends from Buddhism's incipient stage to the Three Kingdoms period. The second shift represents the Korean effort to understand various doctrines and corresponds to the Unified Silla and Koryô periods. The third shift involved the defense of Buddhism from the criticisms of neo-Confucianism during the Chosôn period. Each paradigm shift represented a Buddhist response to challenges from either within or outside itself; in this way, Korean Buddhist philosophy developed continually. The new understandings which occurred at each shift did not disappear with the next shift, but rather remained as integral aspects of the Korean Buddhist tradition.

Buddhism's first challenge came from the indigenous shamanistic beliefs which had helped to consolidate the various tribes of the peninsula into unified kingdoms. The Korean Buddhist response was *hoguk pulgyo*, or state-protection Buddhism. Lectures on Buddhist *sūtras* as well as ceremonies to ensure national security were held regularly during the Koryô period. Even during the Chosôn period, when Buddhism was suppressed, the tradition of *hoguk pulgyo* continued in modified form as armed monks organized into armies to resist the Japanese invasion. Although the concept of *hoguk pulgyo* was never elaborated into a sophisticated philosophy, it is nevertheless a pervasive element in the development of Korean Buddhism.

In the second shift characterizing the Koreanization of Buddhism, both Wônhyo and Chinul played pivotal roles. By Wônhyo's time, the major Buddhist texts, as well as the doctrines of the numerous Chinese Buddhist schools, had been introduced to Korea. Wônhyo, using his own hermeneutics of *kae* (unfolding) and *hap* (folding), and his *hwajaeng* (reconciliation of disputes) theory, attempted to reconcile the various doctrinal disputes. In doing so, he neither accepted nor denied any one sectarian perspective. While refusing to accept any one particular doctrine as the whole truth, he recognized all doctrines as the unfolding of one mind, or the Buddha-nature. On the other hand, by 'folding' the various disputes, he synthesized them into a higher perspective of the truth. This approach reflected the fundamental spirit of Korean Buddhism, which preferred to emphasize the similarities rather than the discrepancies among Buddhist schools and among other religions. Thus the primary characteristic of Korean Buddhism, *t'ong pulgyo*, the Buddhism of total interpenetration, began with Wônhyo. It was Chinul, during the

Koryô period, who attempted to reconcile the disputes between Sôn and Hwaôm, the latter representing the scriptural tradition in Korean Buddhism. To establish a new approach to Sôn, he assimilated the theoretical framework of Hwaôm, long considered to be the anithesis of the Sôn approach.

The third shift came from the challenge of neo-Confuciansm, which became the new state ideology of the Chosôn dynasty. Kihwa, and later Hyujông, attempted to maintain the tradition of Chinul's syncretic approach to Sôn while at the same time creating the theoretical framework for the intrinsic unity of the three major intellectual traditions of Korea and all East Asia: Confucianism, Buddhism and Daoism. Continuing the approach, begun by Wônhyo and Chinul, of reconciling disputes by way of a higher perspective, Hyujông suggested that each of the three teachings is a gate leading to the same goal, that is, the *to*, or Way.

In the early twentieth century Korean Buddhists, together with the rest of their countrymen, suffered from colonization by Japan. During this time, from 1910 to 1945, many Korean Buddhist monks such as Master Yongsông (1864-1940), Master Hanyông (1870-1948) and, most notably, Master Manhae (1879-1944) became engaged in a variety of political activities. These worldly involvements, which pulled them away from their practice in the mountains, were undertaken in the *bodhisattva* spirit, that is, as a means of helping to directly alleviate the suffering of others. Due to their participation in these activities, philosophical study was also undermined. Those monks who wished to study Buddhism on a scholarly level travelled to Japan and enrolled in universities there. Japanese Buddhists in turn left their own country for Europe and absorbed the Western perspective from such countries as England, Germany and France. They gradually incorporated this new knowledge into their previous systems of understanding, and in the process Japanese Buddhist philosophy was significantly altered. The Korean monks who visited Japan were exposed to this new perspective and dutifully introduced it to their fellow Buddhists upon returning to Korea. From this time also, Buddhism began to be taught in the universities. This period marks the beginning of a bifurcation between monks and scholars, the significance of which became increasingly reflected in Buddhist scholarship.

In the 1970s and 1980s the philosophical study of Buddhism began to re-appear with renewed interest and energy. This was due to both external and internal factors: externally, Korean Buddhism faced new challenges from the West, primarily in the forms of Christianity and Western philosophy, while internally, the division between monks and scholars had become even more pronounced. In the 1980s a debate arose among monks and scholars over the issue of 'sudden' versus 'gradual'. Although this debate centred around the age-old conflict between direct experience and intellectual understanding, and thus between Sôn and doctrinal schools, due to the above-mentioned influences the conflict has become a new focus for modern Korean Buddhist thought. The debate itself has become well known not only throughout Korea but internationally as well. Yet to this day, no satisfactory resolution has been reached: some emphasize the importance of direct experience while others stress the necessity of intellectual understanding. Perhaps the conflict cannot be resolved, and this may be a reflection of our modern times. Yet what seems to be called for is a new methodology with which to consider the problem. The *t'ong pulgyo*'s perspective is unique to Korea and has served well in the past. Can Korean Buddhists find another way to embrace the understanding which it signifies, or do they need to discover an altogether different means of confronting the issue, one that stands outside of *t'ong pulgyo*? The times are unique; certainly any approach towards resolving the difficulties must be unique as well.

Büchner, Friedrich Karl Christian Ludwig (Louis) (1824-99)

Ludwig Büchner wrote one of the most popular and polemical books of the strong materialist movement in later nineteenth century Germany, his Kraft und Stoff (Force and Matter) (1855). He tried to develop a comprehensive worldview, which was based solely on the findings of empirical science and did not take refuge in religion or any other transcendent categories in explaining nature and its development, including human beings. When Büchner tried to expose the backwardness of traditional philosophical and religious views in scientific matters, his arguments had some force, but the positive part of his programme was not free of superficiality and naivety. Büchner's writings helped to strengthen progressive and rational traditions inside and outside philosophy, but they can also serve as the prime example of the uncritical nineteenth-century belief in science's capacity to redeem humankind from all evil.

Büchner is commonly grouped together with Karl Vogt and Jacob Moleschott as one of the classical triumvirate of materialist philosophers in nineteenth-century Germany. Their special variant of materialism is often distinguished from other brands as 'mechanical', 'bourgeois', 'scientific' or 'vulgar' (see Materialism §3). Büchner's *Kraft und Stoff (Force and Matter)* became the most popular and enduring work of the materialist movement. Up to the First World War, it went through twenty-one editions and was translated into seventeen foreign languages, where it often saw numerous editions of its own.

Ludwig Büchner was born in Darmstadt, Germany. Like his brothers and sisters, he had a predilection for literary and journalistic activity and was engaged in republican and revolutionary opposition against the oppression of the *Vormärz* era. Büchner took up medicine at the university of Gießen in 1843 and became active in the revolutionary democratic movement of the time. In 1848 he entered his father's medical practice. In 1852 he became lecturer in medicine at the university of Tübingen, but soon lost his post when *Kraft und Stoff* appeared. He returned to Darmstadt where he stayed for the rest of his life, practising medicine, popularizing science and writing on materialist philosophy, political and social issues.

In *Kraft und Stoff*, Büchner set out to formulate the philosophical consequences which he saw in the science of his day. He propagated a thorough empiricism, rejected metaphysics and speculative philosophy and every aprioristic tendency. No supranaturalism or idealism was to be allowed in the explanation of natural events and processes.

The arguments of the book are more or less all derived from its central claim, taken from Moleschott, that there is 'no matter without force and no force without matter'. Force is inseparably bound to a material substrate and thus cannot be regarded as a kind of supernatural, transcendent entity. All changes and events follow mechanical laws. These laws are not imposed on nature from outside, but are built into matter itself. Matter is eternal and has no bounds, neither on a microscopic nor on a macroscopic scale. It is ruled by rigid and universal laws which do not allow for miracles. Soul or mind, as well as organic life, are the product of specially combined materials that are endowed with special mechanical forces. There is neither an immaterial spiritual substance, nor a vital force, nor an externally set purpose of nature.

Neither Büchner's claims nor his supportive arguments can be said to be original. *Kraft und Stoff* was less an elaborated philosophical essay than a racily written summary of the materialistic trends of his time which did not mince its words and was intelligible to the layperson. At the same time, it carried a strong political significance. The flourishing of research in the natural sciences and technology was seen as a new and effective form of opposition against the reactionary political powers which had defeated all liberal-republican and national aspirations by suppressing the revolution of 1848. The growing labour movement took Büchner's materialism as a refutation and exposure of the ideology of the ruling classes and devoured his book. This sort of writing also quenched the thirst for knowledge of several generations of students at the *Gymnasium*. By appealing to the impartiality and the common sense of the autonomous reader and leaving the intricacies and obscurities of German speculative philosophy behind, Büchner's work gave rise to a new genre of popularizing literature in which a rational and empiricist *Weltanschauung* is developed on the basis of natural science. Ernst Haeckel, Wilhelm Ostwald, Wilhelm Bölsche, the early Vienna Circle and to a certain extent even Ludwig Wittgenstein in his *Tractatus* all continued this tradition. As Büchner put it: 'Philosophical elaborations not accessible to every educated person are not worth the printer's ink used for them. What is thought out clearly can be said clearly and

plainly' (1855).

In the course of time Büchner enlarged the topics of his writings mainly in two respects. After the rise of Darwinism he emphasized its intimate relation to or even virtual identity with materialism and tried to show its positive implications for a general theory of progress. The other attempt at expanding the realm of his philosophy was to erect a humanistic and rational sociopolitical theory on his materialism which still owed very much to his liberal ideas of 1848. After the foundation of the new *Reich* he did not succumb to the temptations of nationalism, although his social and political ideals started to become obsolete and did not find a large number of supporters. His considerations included a far-sighted condemnation of the anti-Semitism of his time.

Büchner's work met with harsh opposition from many different quarters. From a philosophical point of view, the most important and momentous criticism was expressed by Friedrich Albert Lange (§2) in his *Geschichte des Materialismus und Kritik seiner Bedeutung in der Gegenwart (History of Materialism and Criticism of its Present Importance)* (1866). While standing up for Büchner against the accusation that materialism leads to immorality, and conceding a materialist methodology as even a necessity for the working scientist, Lange gave a penetrating analysis of the internal difficulties, weaknesses and inconsistencies of the philosophy of Büchner and other materialists.

This kind of criticism formed a crucial motive for rising Neo-Kantianism and led to a general recovery of philosophy's standing in Germany. Even among those who admitted the centrality of science for modern society and saw much truth in materialism, the conviction arose that philosophy had more to say than is contained in *Kraft und Stoff* and that it had not lost the right of autonomy *vis-à-vis* science.

Buffier, Claude (1661-1737)

A French Jesuit who flourished in the early eighteenth century, Buffier developed an outlook that he referred to as common-sense philosophy. While deeply influenced by the philosophies of Descartes and Locke, he saw their reliance on the testimony of inner experience to be conducive to scepticism concerning the external world. In reaction to this, he sought to establish the irrevocable claims of various 'first truths', which pointed towards external reality and qualified it in various respects. His work anticipates certain themes that surfaced later in the common-sense philosophy of Thomas Reid.

Buffier was born in Poland to French parents. He pursued his studies in the Jesuit college at Rouen, and entered there as a novitiate at the age of 18. His career was spent almost entirely at the college of Louis-le-Grand in Paris, first as a teacher then, after 1699, as 'scriptor', a position that enabled him to devote all his energies to writing. He wrote extensively on philosophy, geography, history, and grammar (often in verse, to facilitate memorization) and made important contributions to the *Dictionnaire de Trévoux* and the *Mémoires de Trévoux*.

Buffier's philosophical writings provide little indication of his Jesuit commitments - perhaps it was this that led Voltaire to refer to him as 'the only Jesuit to have put forward a reasonable philosophy in his works'. It is Descartes and Locke who emerge as principal sources of Buffier's thinking, though he was no slavish disciple of either. To both of these thinkers he owed the belief that inner experience (*le sentiment intime*) provides the strongest possible certification for truth, and that any logically correct inferences based on such experience are equally incontrovertible. Yet he realized that if we take such evidence to be the only philosophically legitimate evidence, solipsism and scepticism follow immediately. And these positions he regarded as absurd.

Rather than call into question the Cartesian premises, as some later thinkers were to do, Buffier sought to establish that various propositions pointing towards the external world and indicating something of its nature are every bit as acceptable, philosophically, as the claims of immediate experience. These propositions he termed the first truths of common sense (*le sens commun*), and he held that they reflect certain dispositions that nature has placed in us all in order to bring unity to what would otherwise be a heterogeneous mass of idiosyncratic judgments springing from the immediate experience of each of us.

First truths are not established by any straightforwardly deductive process, for they are only to be reasoned *from*. They reveal themselves instead through their clarity and universality: no propositions offered to support or supplant them could be formulated more clearly than they are; and they show themselves either to be explicitly acceptable to all sane persons who have reached the age of reason, or to be embedded in the conduct of all, even of those who might indulge in their denial. Some examples of these first truths are:

Bodies exist;
There are other beings and other people than myself in the world;
I possess something I call intelligence and something independent of this intelligence that I call my body;
The presence of design, such as we find in a watch, requires an intelligent designer;
The self or soul is absolutely one;
I possess a free will.

While Buffier does recognize certain differences between the claims of outer and inner experience, he refuses simply to place them on the same scale and declare the former to be weaker than the latter. Instead, he will say that both are equally 'certain', although through inner experience we grasp truths with greater 'vividness'; or that to deny inner experience would take one out of 'oneself', while to deny our outer experience would place one outside 'reason' (by leaving one with no ultimate premises to reason from); or that denial of the former might lead to contradiction, but denial of the latter would indicate some form of madness (taking one outside the domain of reasonability). The exigencies of life, in short, require us to accept and live in accord with the dictates of common sense.

Buffier accepts calling such truths innate ideas, if we mean by this that they constitute certain dispositions by which the mind grasps reality. However, he rejects any belief in innate ideas (see Innate knowledge) if these are construed as particular items standing permanently before the mind for contemplation. In fact Buffier rejects the

very conception of ideas as ‘things’ that stand before the mind, regarding them instead purely as modifications of our soul in so far as it is thinking, which suggests that the mind, when it receives an idea, is no more distinguishable from that idea than a ball set in motion is distinguishable from the motion it receives. This point, touched upon but lightly by Buffier, was to become the very focus of Reid’s critique of the ‘ideal system’ (see Reid, T.).

Noticeably absent from Buffier’s list of first truths is any that makes mention of God’s existence. He believed, rather, that this particular truth followed reasonably from the first truth by which we infer the existence of an intelligent designer from the observation of design in an object. Quite generally, where philosophical and scientific questions are concerned, Buffier maintains an empiricist’s reserve, deploring such speculative excesses as one finds in Descartes’ physics or Malebranche’s metaphysics. And while his principal philosophical priority involves overcoming the hyperbolic scepticism associated with solipsism, he freely affirms our ignorance of the ultimate causal forces at work in the universe. The essences of things that we can know are but nominal essences, while real essences stand beyond our reach - real essences being understood by Buffier not as those that ground the qualities of a given substance, but as those that render an individual truly unique. Out of this ignorance, however, emerges an emphasis on the important position occupied by probability (*vraisemblance*) in forming sound opinions and making judicious decisions.

Buffon, Georges Louis Leclerc, Comte de (1707-88)

Both as a scientist and as a writer, Buffon was one of the most highly esteemed figures of the European Enlightenment. In depicting the perpetual flux of the dynamic forces of Nature, he portrayed the varieties of animal and vegetable species as subject to continual change, in contrast with Linnaeus, whose system of classification based on physical descriptions alone appeared timeless. But Buffon's definition of a species in terms of procreative power excluded the evolutionary hypothesis that any species could become transformed into another. Hybrids, as imperfect copies of their prototypes, were in his scheme ultimately destined to become sterile rather than to generate fresh species. By virtue of the same definition, he judged that the different races of mankind formed family members of a single species, since the mating of humans of all varieties was equally fertile.

1 Career

In his own lifetime among the most highly esteemed of all the *philosophes* of the age of Enlightenment, Buffon achieved eminence within the intellectual and political establishments of his day rather than, like either Diderot or Voltaire, as an independent writer outspokenly critical of prevalent orthodoxies. Born in Montbard, he first gained distinction and early admission to both the Académie des Sciences and the Royal Society for his work on mathematics. By 1739 his writings on organic nature had won him sufficient renown to secure his appointment as keeper of the Jardin du Roi in Paris, which formed both a botanical garden and a zoological museum. From that base until his death, he became one of the most celebrated men of science and letters in France. On account of its being published by the Imprimerie Royale, his massive *Histoire naturelle (Natural History)* (1749-88) largely escaped the clutches of censorship and official criticism which befell so many of his prominent contemporaries. In 1753 he was elected a member of the Académie Française, and he was to become a corresponding member of more scientific and learned societies than perhaps any other figure of the eighteenth century. Hume remarked of him that he seemed less like a writer than a marshal of France.

2 His *Histoire naturelle*

Buffon conceived his *Histoire naturelle* principally as an account of the generative and degenerative properties of Nature, along lines which contrasted with the descriptive taxonomy of Linnaeus, and it was set within an even wider cosmology opposed to the mechanistic philosophy of Newton. As distinct from the Linnaean system of classification based upon observable similarities of organic structure, Buffon's causal and developmental scheme of Nature addressed its procreative powers and variable manifestations through time and space. Through his reading of such works as Madame Du Châtelet's *Institutions de physique (Instruction in Physics)* of 1740, he was persuaded that Christian Wolff's conception of Nature as a set of dynamic forces of impulsion which engendered the life-forms of matter was more plausible than Newton's notion of inert Nature framed by absolute time and space (see Wolff, C.; Newton, I.).

Supposing that the planets had been formed from the impact of comets with the sun, he argued that the topography of the earth was attributable to the effects of erosion. Just as civil history records the epochs of the revolutions of human affairs and the occurrence of moral events, so does natural history record the physical development and transformations of the world, he claimed. In his creation of heaven and earth, God had made only the matter of the universe. The earth's consolidation, with the introduction of water, the birth of volcanoes, the separation of continents, the generation of animals and the emergence of the human race, constituted the history of all organic substance, which Buffon was to term *les époques de la nature* in the most celebrated volume of his work, bearing that title, published in 1778. From his manuscripts it appears that he supposed the earth might be 3 million years old, but in print he allowed only a total of around 75,000 years.

3 His notion of a species

Buffon's early interest in mathematics had included research in infinitesimal calculus, a subject which accorded well with the ancient doctrine to which he subscribed, of a natural chain of being, or *scala naturae*, linking all vegetables and animals by a series of gradations of their physical form. In part because he accepted that Nature's ladder consisted of unbroken steps, each in its place from the start, Buffon doubted the central premise of what

would become evolutionary or Darwinian biology, according to which one species generates another. Along lines corresponding to Plato's theory of Forms, he even maintained that, because species are perpetual and permanent, they comprise the only true beings in Nature. Each individual organism, or what is now termed a 'phenotype', he thought, was patterned by the *molécule organique* or *moule intérieur* of its prototype - which today would be termed the 'genotype' of its species as a whole.

But Buffon's conception of each species' form was more dynamic than that of any philosopher of nature before him. The most striking difference between the world's animal and vegetable matter, he claimed, is the power of movement possessed by animals alone, allowing for the fact that some animals, such as oysters, lack that power as well. Buffon noted that individual members of species may be altered or improved by climate or nourishment, and he therefore stressed that the phenotypes of organisms were marked by their differences or variability. Permanence or fixity, however, was generically inherent in every species, he insisted. Contending that Nature is in continual flux, he perceived the diverse instantiations of species as either improving or degenerating according to their circumstances, a point which he illustrated most strikingly with respect to the flora and fauna of the New World as contrasted with the Old, in so far as he deemed the North American puma to be a diminutive lion and the South American llama just a small camel.

The crucial factor which determined the nature of a species, according to Buffon, was not physical resemblance of bodily parts, as in Linnaeus' taxonomy, but procreative ability - a species being defined as a constant succession of similar individuals that can reproduce together. The sterility of hybrids - such as a mule interbred from the horse and ass - made it difficult for Buffon to lend credence to any ideas of descent with modification or the transformation of one species into another, as had been mooted by his contemporary, Maupertuis (see Species).

4 His anthropology

Buffon's definition of a 'species' in terms of its power of procreation led him to view the whole of humanity as forming only one species, whose populations were differentially tinged by the sun in higher and lower latitudes. There could be other determinants of race, he allowed, such as bile or blood, but in general he supposed that skin colour was an acquired characteristic shaped essentially by climate, thus following Montesquieu's conjectures on the climatological determinants of men's moral traits (see Montesquieu). Believing that the progenitors of the human race must have been white, Buffon held that the skin colour of blacks was merely a deformation of the archetype of humanity. This proposition excludes the evolution of mankind from the ape, since a white archetype would scarcely have arisen from a black animal without a soul, he thought. But it did permit a proposition that others would pursue to a racist conclusion - that apes might be degenerate blacks.

Buffon himself categorically rejected that hypothesis, both because he thought the human faculty of reason established an unbridgeable gulf between mankind and the rest of Nature, and because there was no evidence of viable offspring from matings between apes and humans such as were produced from the racial interbreeding of blacks and whites. Stressing that animation - or life - is a property of matter, while thought is a property of spirit alone, he was convinced that the entire human race sprang from the same family and formed only one species. A disciple, Cornelius De Pauw, nevertheless contended in his *Recherches philosophiques sur les américains* that the native inhabitants of America had degenerated to the level of orang-utans, a proposition rejected by Henry Home, Lord Kames, in the polygenist theory of multiple races which he set out in his *Sketches of the History of Man* of 1774, largely as a refutation of the monogenetic anthropology of Buffon.

Bulgakov, Sergei Nikolaevich (1871-1944)

*A luminary of the Russian Religious-Philosophical Renaissance, Bulgakov moved from Marxism, to idealism, to Christianity in the early twentieth century. He rejected historical determinism, class struggle and all theories of progress that accept the suffering of one generation as a bridge to the happiness of another. He regarded the abolition of poverty as a moral imperative, insisted that Christianity mandates political and social reform, and wanted to create a new culture in which Orthodox Christianity would permeate every area of Russian life. His most important philosophical works, Filosofiia khoziaistva, chast' pervaia (The Philosophy of the Economy, Part I) (1912) and Svet nevechernyi (Unfading Light) (1917), reflect his turn to a Solov'ëvian mysticism which apotheosized transfiguration, Sophia and Godmanhood (*Bogochelovechestvo*). Bulgakov saw the cosmos as an organic whole, animated and structured by a World Soul, an entelechy that he called Sophia, Divine Wisdom. Sophia mediates between God and his creation, working mysteriously through human beings. In emigration, Bulgakov developed new interpretations of Orthodox dogmatics and participated in the ecumenical movement. His lifelong concerns were the Church in the world and the interconnection of religion and life. His writings on contemporary political, social and cultural issues helped inspire the Russian Religious-Philosophical Renaissance.*

1 Life and early writings

Bulgakov was born in Livny, Orel province, a descendant of six generations of priests. He started out to be one, but left the seminary in 1888, studied in a secular gymnasium and then entered Moscow University's juridical faculty, graduating in 1894. He had advanced training in economics and statistics and taught these subjects at the Moscow Technical Institute. A 'legal Marxist' in the mid-1990s, Bulgakov contributed to left-leaning journals and was a progenitor of the 'back to Kant' movement, which tried to supplement Marxism with an autonomous ethic. His book, *O rynkakh pri kapitalisticheskom proizvodstve (On Markets in Capitalist Production)* (1897), which argued that Russia could achieve capitalism on the basis of its domestic market alone, brought him a national reputation. Between 1898 and 1900 Bulgakov did research for his doctoral dissertation in Western Europe, mostly in Germany. His chance discovery of Raphael's Sistine Madonna at an art gallery in Dresden made him realize, though not immediately, that he needed 'not a philosophical idea but a living faith in God, Christ, and the Church'. In 1898 he married Elena Tokmatova. They had two sons and a daughter; a mystical experience at the funeral of a third son, who died in 1909 at the age of 3, deepened Bulgakov's religiousness.

After returning to Russia, Bulgakov taught political economy at the Kiev Polytechnical Institute and Kiev University. In *Kapitalizm i zemledelie (Capitalism and Agriculture)* (1900) he argued that small farms are more productive and stable than large ones, contradicting the Marxist view. His essay, 'Basic Problems of the Theory of Progress' appeared in the symposium *Problemy idealizma (Problems of Idealism)* (1902) and in his own collection, *Ot Marksizma k idealizmu (From Marxism to Idealism)* (1903). One essay asked the question 'What does the philosophy of Solov'ëv give to the contemporary consciousness?' 'Positive all unity' and fusion of Christian theory and Christian practice (see Solov'ëv, V.S.) was Bulgakov's answer. Already critical of abstract German Idealism, he believed that philosophy must encompass 'living experience'. In 1904 he became a co-editor of Merezhkovskii's journal *Novyi Put' (New Path)* and, in 1905, of its successor *Voprosy zhizni (Problems of Life)*. During the Revolution of 1905 Bulgakov advocated a Union of Christian Politics, and helped found the Christian Brotherhood of Struggle and the Moscow branch of the Religious Philosophical Society. In 1906 he left Kiev to become Professor of Political Economy at the Moscow Commercial Institute and to teach at Moscow University. The same year, he was elected to the second Duma as a non-Party Christian Socialist on the Kadet slate. Bulgakov regarded the popularity of socialism as a punishment for the sins of historical Christianity and a call to repent for ignoring poverty and injustice. In 1908 he returned to the Russian Orthodox Church. Around the same time Bulgakov began a second intensive reading of Solov'ëv and became close friends with the philosopher-priest Pavel Florenskii. In 1909, Bulgakov attacked the revolutionary intelligentsia as egoistic and destructive in 'Geroizm i podvizhnichestvo' (Heroism and Selfless Devotion), his contribution to *Signposts* (see Signposts movement). The same year, he called for an Orthodox work ethic as part of a larger attempt to create a distinctive Orthodox culture that would permeate every area of Russian life from the most exalted to the most prosaic. In 1910, Bulgakov helped found the Orthodox publishing house Put'. In 1911, he resigned from Moscow University in protest against

the suspension of university autonomy, but resumed teaching there in 1917. As a delegate to the All Russian Council of the Orthodox Church (1917-18), he worked to restore the Patriarchate.

In June 1918 Bulgakov was ordained as a priest, losing his professorship as a result. He taught at the University of Simferopol, in the Crimea, until 1921. After being expelled from Russia on 30 December 1922, he lived in Prague for two years and then settled in Paris. He helped found the Russian Student Christian movement and the Orthodox Theological Institute, serving as its Dean and as Professor of Dogmatic Theology. In 1939, Bulgakov lost his voice almost completely as a result of surgery for throat cancer, but he continued to celebrate the liturgy and to conduct his classes.

2 *The Philosophy of the Economy* and *Unfading Light*

These works represent Bulgakov's attempt to create an Orthodox philosophy. In *Filosofiia khoziaistva, chast' pervaia (The Philosophy of the Economy, Part I)*, he discussed the meaning and significance of the economy, including its epistemology, ontology and phenomenology, and promised to discuss ethics and eschatology in Part II. His purpose was to reveal an inherent cosmic meaning in the most prosaic human actions - production and consumption - as well as the intrinsic kinship of man and the cosmos and their basis in God and in Sophia, the mediator between God and the world. Interpreting 'Marx in the spirit of Boehme and Boehme in the spirit of Marx', Bulgakov stressed the centrality of labour, the need to increase production, and the Hegelian and Marxist concepts of freedom and necessity, mingling these ideas with Boehme's concept of the World Soul (see Boehme, J.). Bulgakov taught that human labour, physical and mental, has metaphysical and cosmic significance because through it, Sophia permeates and transfigures the world. All human activity contains elements of freedom and necessity, of Sophia and anti-Sophia respectively. Explaining economic activity (activity conducted out of necessity) in terms of the Fall, Bulgakov maintained that before it, labour was disinterested and loving, but then 'nature, damned by God, became a hostile force, armed with the powers of hunger and death'. Economic activity became a struggle for survival, concealing the Sophianic significance of labour and engendering the materialistic ideology of economism, the view of life as only or primarily an economic process. Science arose as part of man's attempt to subjugate 'Tsar Nature', and therefore also contains Sophianic and anti-Sophianic elements, as does art - the most Sophian human activity. Creative activity is of divine origin, by way of Sophia, for only God can create. But God allows man to participate in his salvation and to be a co-creator. Labour is humankind's means of redemption.

Objecting to the Kantian bifurcation of subject and object, Bulgakov maintained that man is the subject *and* the object of the economy, and stressed the former, the active subject, the proprietor (*khoziain*) of a farm or a business. He described economic creativity as a primarily psychological phenomenon, 'a phenomenon of [internal or] spiritual life', and associated creativity with individuality and freedom. An Orthodox economy would be characterized by *sobornost'*, unity in love and freedom, not impersonal collectivism or egoistic individualism. Egoism was a result of the Fall, which shattered the wholeness of the cosmos, and separated people from one another.

Bulgakov looked forward to a new era when the tyranny of nature would be overcome, when man would rule the economy instead of being ruled by it. Labour would again be voluntary and joyful, and would merge with artistic creativity. This 'leap from necessity to freedom' was not foreordained, he insisted, because the principle of Sophia is freedom. But elsewhere in the book, Bulgakov explained the apparent discord and chaos of economic life as the workings of a superpersonal force, a mystical version of Hegel's 'cunning of reason' and suspiciously akin to 'necessity'.

Bulgakov never wrote Part II. He considered *Svet nevechernyi (Unfading Light)* the continuation of Part I, but it was more theological in nature. Bulgakov argued that God created the world out of nothing as an emanation of his own nature, not as something alien or external to him, and then pronounced his creation 'very good' (Genesis 1.31). This means that Christians must not reject the world, or nature, or 'the flesh'. Bulgakov also argued that God created the world as dynamic becoming, not as eternal being. Therefore, the world is not evil but incomplete. In the section titled 'The Sophianicity of the Creature', Bulgakov described Sophia as the living link between God and the creature, as a kind of fourth hypostasis outside and different from the Trinity, and as the object of God's love. He was ambiguous on whether Sophia is a person or a force, but he did say that Sophia is revealed to the world as beauty. In later works, Bulgakov distinguished between the 'divine Sophia' and the 'created' or

'creaturely Sophia', but he continued to emphasize their ultimate metaphysical identity and hence the consubstantiality of God and the cosmos. In *Svet nevechernyi*, Bulgakov attacked Boehme's mysticism as pantheism or 'immanentism' and declared that this 'heresy' became the basis of subsequent German thought. But Bulgakov also argued that pantheism contains a grain of religious truth and must be absorbed into an Orthodox cosmology which does not negate the world. In later works he distinguished panentheism from pantheism. Apropos of the promised treatment of ethics and eschatology, Bulgakov attributed evil to the nothingness or non-being that is the substratum of the cosmos and that erupts in human wilfulness, but he provided no guidelines for conduct except to condemn egoism and individualism and praise humility and love. Bulgakov's eschatology featured the transfiguration of the world through art, which he called 'Sofiiurgy', not 'theurgy', as the Symbolists did, and the divinization of all humankind, that is, Godmanhood. Resurrection would be a universal phenomenon, for man is 'one Adam' and the cosmos is 'one corporeality and one body'.

3 From Orthodox philosopher to dogmatic theologian

Svet nevechernyi, *Die Tragödie der Philosophie (The Tragedy of Philosophy)* and *Filosifiia imeni (The Philosophy of the Name)*, the latter two written between 1919 and 1921, mark Bulgakov's transition from Orthodox philosophy to dogmatic theology, and his rejection of philosophic idealism. In *Die Tragödie der Philosophie*, Bulgakov declared that philosophy must be the handmaiden of religion, not just of theology; that is, philosophy must encompass religious experience, ritual, and personal revelation. He criticized Kant, Fichte, Hegel and Spinoza extensively, partly because they dichotomized consciousness into 'I-not I'. Bulgakov posited a dialogic consciousness - 'I am thou, he, you, and we' - relating this conception to a triune theory of human relations which he in turn related to the Holy Trinity. *Filosofiia imeni* was Bulgakov's response to a dispute in the Orthodox Monastery of Mount Athos about whether the name of God was itself divine and also to Symbolist writers' debates on the nature of the Word. Bulgakov argued that the name of God was inseparable from the divinity but not identifiable with it, and that the very act of naming connects God and man. Words are living symbols that connect the empirical and the invisible worlds.

In emigration Bulgakov turned to patristics as part of a heightened emphasis on Orthodox tradition and on the Church as an institution. He described the Church as a living body, the Body of Christ, and maintained that tradition, including dogma, encompasses 'the new in the old and the old in the new'. Bulgakov interpreted Orthodox dogmatics in this spirit. Sophiology, treated somewhat differently, remained his central theological concept. The émigré Church in Karlovtsi, Serbia, and the Moscow Patriarchate alike accused him of heresy. Underlying their attack was hostility to any reinterpretation of dogma at all. Bulgakov's dogmatic works are not available in English. To date, they have not been reprinted in Russia, but his earlier writings are available and are attracting a great deal of attention.

Bultmann, Rudolf (1884-1976)

Rudolf Bultmann was one of the most influential Protestant theologians of the period that immediately followed the Second World War. A founding member of the school of dialectical theology in the 1920s, he was a major New Testament scholar, who refined the method of form criticism. He argued that the Synoptic Gospels reveal not the historical Jesus, but the Christ of faith, the Christ-myth developed by the early church. The existentialist philosophy of Martin Heidegger was a major influence, and he adapted it to the needs of Christian theology, devising an existential access to faith. He contrasted Historie - *objective, factual accounts of historical events* - *with* Geschichte - *the meaning that people choose to give to those events. One must demythologize the New Testament* - *strip it of its prescientific imagery* - *before one can interpret its significance for oneself. Bultmann defined biblical hermeneutics as an inquiry into the reality of human existence and proposed a new understanding of the person and teaching of Christ. Central to this is the concept of the* kerygma, *the proclamation of the salvation-event focused on Christ. It is in response to the* kerygma *that a human being can actively opt for faith. Bultmann reinterpreted the Lutheran doctrine of justification and the theology of the cross in the light of this.*

1 Life

Rudolf Bultmann was the son of a minister of the German Evangelical Lutheran Church. At Oldenburg he attended the same gymnasium as Karl Jaspers. He read theology at Tübingen, Berlin and Marburg. Karl Müller (Church history), Adolf von Harnack (history of dogma), Hermann Gunkel (Old Testament), Adolf Jülicher and Johannes Weiss (New Testament), and Wilhelm Herrmann (systematic theology) were among his teachers. He graduated in New Testament studies in 1912. His teaching activity began at the University of Marburg, where he spent a lot of time in the company of Martin Rade, whose theological journal *Die christliche Welt* had a wide audience. In 1916 he was invited to teach at Breslau and received a call to a chair at Giessen in 1920. A year later, he was offered a chair at the university of Marburg. Meanwhile he had released *Die Geschichte der synoptischen Tradition (The History of the Synoptic Tradition)* (1921).

At Marburg, Bultmann taught New Testament for thirty years. There he became acquainted with Rudolf Otto and Martin Heidegger. During the National Socialist dictatorship, he courageously joined the Confessing Church and spoke openly against the ‘Aryan Paragraph’. In 1941, he delivered a highly influential lecture to a circle of ministers: ‘New Testament and Mythology: The Problem of Demythologizing the New Testament Revelation’. Bultmann’s demythologizing programme aroused ecclesiastical indignation which resulted in its official rejection at the General Synod of the German Evangelical Church in 1952. His years at Marburg were among his most creative: *Jesus* (1926), *Das Evangelium des Johannes (The Gospel of John)* (1941), *Theologie des Neuen Testaments (Theology of the New Testament)* (1948-51), *Das Urchristentum in Rahmen der antiken Religionem (Primitive Christianity in its Contemporary Setting)* (1949) and *History and Eschatology* (1957) were among the works he wrote. Most of his articles were collectively published in *Glauben und Verstehen (Faith and Understanding)* (1933-65). Bultmann retired in 1951.

2 History and myth

As a member of the school of dialectical theology that Karl Barth (§§1-2), Eduard Thurneysen and Emil Brunner (§1) had started in the early 1920s, Bultmann rejected the liberal way of treating Christian faith as a phenomenon of the history of religion. However, unlike Barth, he carried forward the tradition of biblical criticism. In spite of the acknowledgement of the paradoxical nature of revelation and faith in Barth’s *Der Römerbrief (The Epistle to the Romans)* (1919), Bultmann did not surrender the method of history of religion that he had successfully applied in his doctoral dissertation. He was interested in understanding early Christianity within the wider religious and cultural context of its time, and endeavoured to retrace the influence of pre-Christian Gnosticism, Jewish apocalyptic and Manicheism on the New Testament writings. This orientation led to the later theory of demythologization. Like David Friedrich Strauss (§1) and the School of Marburg, Bultmann had a modern worldview and wanted to cleanse the New Testament of its naïve prescientific one. His exegetical research primarily concerned the pre-literary traditions of the New Testament. He investigated the internal development of the text, its ‘setting in life’ (*Sitz im Leben*) and its literary genres. In this way, he made significant contributions to form criticism.

What are the results of Bultmann's historical investigations? *The History of the Synoptic Tradition* (1921) provides an analysis of the origin and the redactorial process of the traditions underlying the narrative of Jesus' life. In the Synoptic Gospels, the original proclaimer, Jesus, has become the Christ, the one proclaimed as God's decisive act for human beings. The Synoptic Gospels offer an extended picture of the faith of the early Church in Jesus the Christ. They do not proclaim the historical Jesus but the Christ of faith (*der Christus des Glaubens*), the *kerygma*, the Christ-myth. Bultmann unveiled a process in Christology whereby Jesus the historical being developed into the mythical idea of a celestial being, a God-elected king of the eschaton, the pre-existing *logos* and co-begetter of the universe. In a famous monograph (1926), Bultmann characterized this process as a transformation of the Gospel of Christ into the Gospel about Christ. He claimed that the supernatural events in Jesus' life, including the miracles attributed to him, were legendary, mythical accounts. Jesus probably was a disciple of John the Baptist, an eschatological prophet. He created his own community of followers which rivalled that of the Baptist. But unlike the Baptist, Jesus was both a rabbi who taught the Law of God and a prophet who proclaimed the imminent end of the world. Jesus died as a messianic prophet.

Throughout his work, Bultmann thoroughly respected the principles of positivist historiography. In his view, there is only one historical method, common to both the believer and the unbeliever. Against Nietzsche, who claimed that there are only interpretations, he maintained that historical events are knowable objectively. He was aware of the historian's subjectivity, but subjectivity is not subjectivism. In this respect, the most subjective history is the most objective. Bultmann, however, did not confine himself to the quest for the historical Jesus. The meaning of the Christ-event for the believer, its significance for the individual, was of crucial importance to him. Owing to the adoption of Heidegger's existential analysis, Bultmann was able to draw an all-important distinction between *Historie* and *Geschichte*. *Historie* concerns objective, factual accounts of past events, whereas *Geschichte* points to the intentionality or the meaning of events for the people who encounter them. Historical facts are neutral, but *geschichtliche* events concern people's existence and prompt a for-or-against decision on their part. In order to discover the response of Christian faith to the Christ-event, one must divest the New Testament of the prescientific imagery in which it has been cast; one must 'demythologize' its message. This was the purpose of Bultmann's demythologizing programme.

3 Existential interpretation

Once demythologized, theological doctrines such as virgin birth, pre-existence, resurrection, ascension, original sin, miracles, angels, demons, and so on must be interpreted in order to attain their significance for the individual. In accordance with the early Martin Heidegger (§§2-3), Bultmann put forth an existential interpretation. Heidegger's *Sein und Zeit (Being and Time)* (1927) phenomenologically describes the existential structure of the human being. In this analysis of the ontological constitution of *Dasein* (being-in-the-world), existence is understood as a special mode of being independent of natural determination. Fundamental ontology is related to, but not identical with, anthropology. As Bultmann retained from Barth a trans-subjective understanding of revelation and faith, so he borrowed an existentialist ontology from Heidegger. Bultmann's concern for existence derived from a need to secure a realm of freedom in a world of causality and necessity. Contrary to the rational being, who is confined to objectivity, the free and volitional being exists in and through their decisions. For, by its essence, will is intentionality, project and decision; freedom is openness to the future. According to Bultmann, a human being's existence is realized in life acts, in the intentionality of decisions which are made ever anew and involve the whole being. A human being may exist either authentically or inauthentically. Inauthentic existence is the search for satisfaction and security in tangible reality, whereas authentic existence is life based on intangible realities, in free and responsible openness to the future, in faith.

Bultmann repeatedly claimed that Heidegger's fundamental ontology was neutral. It therefore can profitably be used to interpret any biblical text, and does not imply a subordination of the Bible to a philosophical framework. For the historian cannot investigate *for me* what that text means about God and his action, nor answer the question of the meaning of a given biblical text *for me*. For any understanding presupposes a prior understanding of the subject. A prior understanding or prior knowledge of the possibilities of one's life is the presupposition for the understanding of any biblical text. Bultmann also adopted Heidegger's idea of a hermeneutical circle. But he further drew a distinction between the existentialist understanding of philosophical analysis, which he called *das Existentiale*, and the pre-philosophical, concrete and ontic self-understanding that he labelled *das Existentielle*. Only the latter clears the way for the understanding and the appropriation of the revelatory action of God.

Consequently, biblical interpretation involves more than linguistic, grammatical and historical research. It implies both an ontology and an anthropology. The connection of text and interpreter, which is founded on the relationship of the interpreter to life, is a further presupposition for the understanding of any biblical text. I can recognize God's action only if I already have an existential (*existentiell*) knowledge of God. I can understand the *kerygma* when it speaks to me of God because I have an existential self-understanding. Thus biblical hermeneutics is understood as an inquiry into the reality of human existence. However, Bultmann did not substitute the existential-eschatological for the historical-objective, but established an authentic relationship instead of the perversion of objectivization or mythologization.

4 *Kerygma* and eschatology

In his early writings, Bultmann established a relationship between theology and anthropology. Theology is a discourse based on divine revelation. However, such a discourse is only possible if it concomitantly speaks about human beings. Thus theology is dialectic on two accounts: the dialectic of the hidden god and the dialectic of human existence. According to Bultmann, theology is the conceptual description of the existence of human beings as being determined by God. God should not be objectified or mythologized; God is the *eschaton*. Revelation is not the disclosure of a set of objective or objectifiable truths, but is God's judgment on the world; it concerns human existence at its deepest. As anthropology is existential (*existentiell*), so theology is eschatological.

The *kerygma*, or proclamation of the salvation-event, is the focal concept of Christian theology. According to the New Testament, Jesus Christ, the Crucified and Risen One, is the eschatological event, the action by which God has set an end to the old world (see Eschatology §1). The *kerygma* is message, testimony and proclamation; preaching is part of the essence of the Word. As eschatological event, the proclaimed *kerygma* is not only the occasion for the decision as to faith, but also the condition for faith. Jesus Christ is present in the *kerygma* and encounters human beings through the *kerygma*. Preaching is in itself an eschatological event prompting an eschatological decision on the part of the hearer.

Bultmann was a Lutheran. The doctrine of justification and the theology of the cross receive a special emphasis in his eschatological theology. The God that human beings encounter through justification by faith is no object of knowledge and thought; it is the acting, transcendent and hidden God. Thus, to have faith is to believe in spite of experience. In faith, a human being surrenders all human securities and overcomes the predicament of human existence, the despair in which human existence is thrown, by choosing freely in favour of authentic existence. Under God's grace, a human being acknowledges a new self-understanding, embraces a new life and accepts a new responsible mode of action born of love. Through the human response to the *kerygma* the 'old man', torn by sin and anxiety, is transformed into a 'new man', freed from this world and rooted in the world beyond. The demythologizing programme that Bultmann launched in the 1950s is fundamentally related to the Lutheran doctrine of justification (see Justification, religious §4). The programme was a radical implementation of the doctrine of justification by faith in the field of knowledge and thought.

The cross of Christ is the salvation-event proclaimed by the New Testament. By the cross, Bultmann does not mean the historical-objective (*historisch*) fact of the crucifixion, but the historical-personal (*geschichtlich*) faith-event that the early Church experienced in relation to the crucifixion. The cross is God's liberating judgment on the world. Because Christ was crucified *for us*, the cross creates a new situation between God and human beings. The cross is not a mere event in the past which can be objectively contemplated. The cross is an occurrence of faith. To the believer, it is an ever-present and repeatable reality, in the sacraments as well as in daily life. Regarding the resurrection, which is inseparable from the cross, Bultmann taught that it was a further proclamation of the eschatological meaning of the cross. The resurrection is no historical fact, but an occurrence of faith. The Easter faith of the early Church was a faith in the glorified Christ. The resurrection is the main eschatological event, the salvation-event that signifies the believer's newness of life. The preached word renders the cross and the resurrection, or the *kerygma*, repeatedly present for all to hear.

In Bultmann's theology, ecclesiology is not less important than Christology. Because God and the Word are eschatological, God's revelation in Christ is not merely a past occurrence to be historically traced. The Word is an ever-living reality which is encountered where it is preached, and among those in which it is alive. Since justification by faith is not only freedom from sin but also freedom for obedience, Christians are called to an

exemplary ethical life and to responsible action in political life. The living Christ reveals himself to the world through the work of salvation that is constantly operating in and through the Church. The end of the world and the coming of the kingdom of God are proclaimed to the world only through the Church. From there the Word calls today's humanity to experience crucifixion and resurrection; the eschatological event is continued in the Church. The Church is the eschatological community, and, like Jesus Christ, the incognito of God.

Buridan, John (*c.*1300-after 1358)

Unlike most other important philosophers of the scholastic period, John Buridan never entered the theology faculty but spent his entire career as an arts master at the University of Paris. There he distinguished himself primarily as a logician who made numerous additions and refinements to the Parisian tradition of propositional logic. These included the development of a genuinely nominalist semantics, as well as techniques for analyzing propositions containing intentional verbs and paradoxes of self-reference. Even in his writings on metaphysics and natural philosophy, logic is Buridan's preferred vehicle for his nominalistic and naturalistic vision.

Buridan's nominalism is concerned not merely with denying the existence of real universals, but with a commitment to economize on entities, of which real universals are but one superfluous type. Likewise, his representationalist epistemology accounts for the difference between universal and singular cognition by focusing on how the intellect cognizes its object, rather than by looking for some difference in the objects themselves. He differs from other nominalists of the period, however, in his willingness to embrace realism about modes of things to explain certain kinds of physical change.

Underlying Buridan's natural philosophy is his confidence that the world is knowable by us (although not with absolute certainty). His approach to natural science is empirical in the sense that it emphasizes the evidentness of appearances, the reliability of a posteriori modes of reasoning and the application of certain naturalistic models of explanation to a wide range of phenomena. In similar fashion, he locates the will's freedom in our evident ability to defer choice in the face of alternatives whose goodness appears dubious or uncertain.

1 Life and work

It is testimony to Buridan's stature and influence that many of the events traditionally associated with his life are the stuff of legend. The stories that the King of France ordered that he be thrown into the Seine in a sack because of a scandalous affair with the Queen, or that, after being driven from Paris for his nominalist teachings, he went on to found the University of Vienna, cannot be verified. What we do know of his life is derived from the facts of his academic career (Faral 1950; Michael 1985). From these it can be inferred that Buridan was born shortly before 1300, probably in Béthune in northwestern France. He served as rector of the University of Paris in 1328, and again in 1340. University documents indicate that he received several benefices to support his work, and that he was much esteemed by his colleagues. He is last mentioned in a document of 1358, and probably died a short time after.

Buridan's academic career was unusual in two respects. First, he spent his entire career as a Master of Arts, without ever seeking an advanced degree in theology. He accordingly produced no commentary on the *Sentences* of Peter Lombard, one of the main genres of philosophical writing in the fourteenth century. Almost all of his written work is based on the Parisian arts curriculum, and reflects his pedagogical concerns as a member of the arts faculty. Second, he remained a secular cleric rather than joining an order such as the Dominicans or Franciscans. This freed him from the doctrinal disputes which often arose between religious orders, something which can be seen in the eclectic character of his work.

Buridan's logical writings are in the form of handbooks and commentaries intended for use by students of logic. Most of his non-logical works appear as short commentaries (*expositiones*) or longer critical studies (*quaestiones*), usually in several versions, based on his lectures on the works of Aristotle. In addition to the entire Organon, these included lectures on the *Metaphysics*, *Physics*, *On the Heavens*, *On the Soul*, *Parva naturalia*, *Nicomachean Ethics* and *Politics*. Only a few of these works are available in modern editions, and none can be dated precisely. However, copies and early printed versions were distributed throughout European universities, where they often served as primary texts for courses in logic and Aristotelian philosophy. As a result, Buridan's teachings continued to shape European thought well into the Renaissance.

2 Logic

Buridan belongs to the 'terminist' tradition of medieval logic, so called because its practitioners regarded terms as the primary unit of logical analysis. He wrote his most comprehensive logical work, the *Summulae de dialectica (Summary of Dialectic)*, as a commentary on the *Tractatus* or *Summulae logicales (Summary of Logic)*, a terminist

textbook composed by Peter of Spain almost a century earlier. However, because Buridan charged himself with ‘analyzing and supplementing’ Peter’s rather elementary remarks ‘sometimes differently’ than Peter himself had expressed them, his comments served as a forum for his own innovative ideas in logic (see Pinborg 1975).

One section of Peter’s text rewritten entirely by Buridan is the treatise on supposition, which deals with the referential function of significative terms in propositional contexts. In this section, Buridan presents a revised account of the divisions of supposition that better expresses his nominalist ontology. He rejects in particular the notion of ‘simple supposition’, by which some logicians held that common terms such as ‘man’ could refer to ‘universal natures… distinct from singulars outside the soul’ (*Summulae* IV, 3). In Buridan’s view, terms refer only to particulars, although they can do so in different ways depending upon their semantic function. Buridan also rejects as superfluous the idea of his Parisian contemporary Gregory of Rimini that what propositions signify, or ‘make known’, is an abstract object that is ‘complexly signifiable’. Further expression of Buridan’s nominalism can be found in the *Tractatus de consequentiis (Treatise on Consequences)*, an advanced study of the theory of inference, in which he argues that one need posit no additional cause for the falsity of a sentence beyond what makes its corresponding negation true.

Buridan moved the Parisian tradition in new directions by developing and then systematically applying semantic theory to solve philosophical problems (Klima 1991, 1992). As well as characterizing his revision of the doctrine of supposition, this emerges in his analysis of the meaning of propositions containing intentional verbs (for example, ‘you know the one approaching’), in which he appeals to the counterpart doctrine of appellation to show how we can ‘understand the same thing in many different ways’ (*Sophismata* IV, seventh remark) without altering the particular denotation of the concept or term used to signify it. Buridan has also achieved some notoriety among modern logicians for his solution to the liar paradox, in part because it preserves bivalence (see Semantic paradoxes and theories of truth). This turns on his suggestion that a proposition *P* is true if and only if (1) it signifies things as they are, and (2) it entails, in conjunction with a proposition asserting that *P* actually exists, another proposition asserting that *P* is true. Buridan then argues that self-referentially paradoxical propositions (for example, ‘every proposition is false’) are false because they cannot consistently satisfy both conditions. Even if we assume that they signify things as they are, the propositions they entail are false because the subject and predicate of the entailed propositions do not ‘stand for the same’ (if *P* is ‘every proposition is false’, then *P* itself must be false, not true), thus failing the second condition (*Sophismata* VIII, seventh sophism) (for discussion see Spade 1978; Hughes 1982) (see Language, medieval theories of; Logic, medieval).

3 Metaphysics and epistemology

Like most medieval nominalists, Buridan argues that commonality is not a real feature of the world. ‘Universals,’ he says, ‘do not exist outside the soul, but are only concepts of the soul by which it conceives of many things indifferently’ (*Summulae* IV, 3). Medieval nominalism, however, was a complex and evolving doctrine whose adherents were not merely interested in the question of universals. The distinctiveness of Buridan’s nominalism consists in the way he implements the more general nominalist aim to economize on entities, of which real universals are but one superfluous type (see Nominalism; Universals).

Buridan’s contribution to the nominalist theory of universals was to develop the semantics for an intentionalist account of common concepts. In a discussion influenced by his Parisian predecessor Peter Abelard, Buridan argues that concepts such as ‘humanity’ and ‘rationality’ are best understood as ways of conceiving individual human beings, rather than as mirroring abstract entities (de Rijk 1992). Although Buridan, like William of Ockham, accepts only substances and qualities in his basic ontology, his explanation of certain kinds of physical change reflects this tendency to multiply modes or ‘ways’ of being, rather than things. Thus he regards changes in the shape or position of a physical substance as changes in the mode(s) of its qualities, that is, in *how* it is, whereas the unadorned substance-quality view would be forced to posit the generation of new qualities. Medieval nominalists also disagreed about where (and how) to use the razor, or principle of parsimony, a fact which distinguishes Buridan’s nominalism from other versions. Buridan differs from his older English contemporary William of Ockham, for example, in his willingness to embrace quantitative forms to explain the impenetrability of bodies.

In epistemology, Buridan is a representationalist who rejects the idea that human knowers possess any intuitive modes of cognition, that is, those which (following William of Ockham and John Duns Scotus) involve the direct and unmediated awareness of some present object (Zupko 1993a) (see Perception, epistemic issues in). Buridan

maintains that on the contrary, all cognition, including singular cognition, occurs when the intellect apprehends an object by means of a particular species or concept representing it. How we use the concept in our act of apprehension determines whether we cognize singularly or universally: singularly, if its object appears to us 'in the manner of something existing in the presence of the person cognizing it'; universally, if we focus on certain features of the concept to the exclusion of others, for example, if we use Socrates's humanity to understand 'all human beings, indifferently' (*Quaestiones super De anima*, third redaction, III, q.8).

Buridan touches on the issue of epistemic justification in the course of rebutting certain sceptical objections to the possibility of scientific knowledge (some of which are associated with his Parisian contemporary, Nicholas of Autrecourt) with naturalistic arguments based on the reliability of human cognitive processes. Thus, he contends that induction and sense perception are justified on the a posteriori grounds that both tend to produce beliefs that are free from doubt and error (although not infallible), and have verifiable results (Zupko 1993a). In general, however, Buridan is much more interested in explaining how we come to have knowledge than he is in exploring the grounds for knowledge claims, an orientation his work shares with most pre-Cartesian epistemology.

4 Natural philosophy

Historians of science have long recognized Buridan's contributions to the field of mechanics, most notably his development of the theory of impetus, or impressed force, to explain projectile motion (Grant 1977). Rejecting the discredited Aristotelian notion of antiperistasis, according to which the tendency of projectiles to continue moving is due to a proximate but external moving cause (such as the air), Buridan thought that only an internal motive force, transmitted from the original mover to the projectile, could explain its continued motion. His account of impressed force differs from others in that he did not see it as self-dissipating: '[this] *impetus*,' he says, 'would be of infinite duration, were it not diminished and corrupted by a contrary which resists it, or by something inclining it to a contrary [motion]' (*In Metaphysicam Aristotelis quaestiones* XII, q.9). He also views impetus as a variable quality whose strength is determined by the speed of and the quantity of matter in its moving subject, so that the acceleration of a falling body is understood in terms of its accumulation of successive increments of impetus. Buridan did not himself use the concept of impetus to revolutionize mechanics, however, since he remained an Aristotelian in other respects, for example in his assumptions that motion and rest are contrary states of bodies, and that the world is finite in extent.

Buridan's explanation of motion is a product of his approach to natural science, which is empirical in the sense that it emphasizes the evidentness of appearances, the reliability of a posteriori modes of reasoning and the application of certain naturalistic models of explanation to a wide range of phenomena. Against the notion that scientific knowledge must be demonstrative and its truths absolutely certain, Buridan argues that natural science, at least, concerns only what happens assuming the common course of nature. This stems from his theological assumption that it is always possible for an omnipotent deity to deceive us in ways we could never detect, tempered by his confidence (for which he often cites empirical evidence) that our powers of perceptual judgment and inductive inference are reliable enough to make 'the comprehension of truth with certitude possible for us' (*In Metaphysicam Aristotelis quaestiones* II, q.1). Likewise, Buridan is confident that certain models of explanation can be used to grasp a whole range of natural phenomena. Thus, the concept of impetus re-emerges in his psychology to explain the difference between occurrent and dispositional modes of intellectual cognition, as well as in his ethics where it is used to account for the relative ease with which virtuous people are able to perform good actions.

Buridan also made an important contribution to the fourteenth-century debate on infinity and continuity, arguing for the divisibilist view that continuous magnitudes are composed not of indivisible atoms but of parts divisible without end, and that the parts of a continuum constitute a potentially infinite set. Again, what is distinctive about Buridan's divisibilism is the way he defends it, by using semantic theory to explain the truth conditions of propositions containing (apparently non-referring) terms such as 'point', the meaning of the term 'infinite' in categorematic and syncategorematic contexts, and the use of the term 'possible' as a modal operator to express the notion of potential infinity (Thijssen 1985; Knuuttila 1992; Zupko 1993b). The mathematical and physical considerations prominent in other medieval discussions of continua occur secondarily for Buridan, almost as an afterthought (see Natural philosophy, medieval).

5 Ethics

Among the most influential of Buridan's commentaries on Aristotle was his *Quaestiones super decem libros ethicorum Aristotelis ad Nicomachum (Questions on the Ten Books of the Nicomachean Ethics)*, a work containing sophisticated accounts of the structure of the will, the nature of human freedom and the phenomenon of *akrasia*, or weakness of the will (see Akrasia). In moral psychology, Buridan appears to effect a compromise between the 'intellectualist' or 'naturalist' tradition associated with Aristotle (§§21-5) and Thomas Aquinas (§13), and the 'voluntarist' tradition of Augustine (§§12-14) and Franciscan thinkers such as Duns Scotus (§14) and William of Ockham (§10). Thus he contends (with the former) that human happiness ultimately consists in an intellectual act, 'the perfect comprehension of God', rather than in a volitional act such as willing or loving, although (with the latter) he emphasizes the role of the will as a self-determining power in achieving that end. The compromise appears to turn on Buridan's innovative concept of free choice, which builds upon Albert the Great's notion that moral certainty admits of degrees (Saarinen 1993) (see Albert the Great §5). Buridan's idea is that even if the will cannot choose evil as such, it still has the power to defer its choice whenever the goodness of the alternatives presented to it remains doubtful or uncertain: a move which, given our poor epistemic position in this life, seems to guarantee the will a certain amount of freedom in practice. The compromise is only apparent, however, because Buridan also insists that deferment is possible only if 'the intellect would judge it to be good to consider the matter further' (*Quaestiones super decem libros ethicorum* III, q.5), a claim which, together with his assumption that the will can choose non-optimally only through ignorance or impediment (q.3-5; 9), places deferment squarely in the province of the intellect, which weighs the relative goodness and badness of possible courses of action, including deferment. The voluntarist language Buridan appropriates to describe the will's freedom is thus used in an intellectualist sense, perhaps to dispel the cloud of heterodoxy that had surrounded several of the main principles of intellectualist moral psychology since the condemnations of 1277 (Zupko 1995).

Buridan's peculiar conception of freedom also provides the most plausible explanation of the use of his name in the example traditionally known as 'Buridan's ass', in which a donkey starves to death because it is unable to choose between two equidistant and equally tempting piles of hay. This particular example is unknown in Buridan's writings, although there are similar cases. The example probably originated as a parody of Buridan's theory introduced by later authors, who perhaps found absurd the idea that the will's freedom could consist in inaction, that is, in its ability to defer the act of either accepting or rejecting some proposed course of action (see Free will).

Burke, Edmund (1729-97)

Edmund Burke's philosophical importance lies in two fields, aesthetics and political theory. His early work on aesthetics, the Philosophical Enquiry into the Origin of our Ideas of the Sublime and Beautiful (1757), explored the experiential sources of these two, as he claimed, fundamental responses, relating them respectively to terror at the fear of death and to the love of society.

Active in politics from 1759, and Member of Parliament from 1765, he wrote and delivered a number of famous political pamphlets and speeches, on party in politics - Thoughts on the Causes of the Present Discontents (1770), on the crisis with the American colonies - On Conciliation with America (1775), on financial reform and on the reform of British India - Speech on Mr Fox's East India Bill (1783). While clearly informed by a reflective political mind, these are, however, pièces d'occasion, *not political philosophy, and their party political provenance has rendered them suspect to many commentators.*

His most powerful and philosophically influential works were written in opposition to the ideas of the French Revolution, in particular Reflections on the Revolution in France (1790), which has come to be seen as a definitive articulation of anglophone political conservatism. Here Burke considered the sources and desirability of social continuity, locating these in a suspicion of abstract reason, a disposition to follow custom, and certain institutions - hereditary monarchy, inheritance of property, and social corporations such as an established Church. His Appeal from the New to the Old Whigs (1791) insisted on the distinction between the French and Britain's revolution of 1688; while his final works, Letters on a Regicide Peace (1795), urged an uncompromising crusade on behalf of European Christian civilization against its atheist, Jacobin antithesis.

1 Early work

Edmund Burke was born on 12 January 1729, of Anglo-Catholic parents, in Dublin. As a young man at Trinity College his early aspirations were literary. He produced a periodical - *The Reformer* - devoted, in the manner of Addison and Steele's *Spectator*, to the reformation of taste as part of a self-conscious moral and political programme, and he retained a concern with the role of manners and taste in sustaining a viable and stable political society. Leaving Dublin to read law at the Temple Inn, he settled in London. There he published a philosophical satire, *A Vindication of Natural Society* (1756), followed a year later by *A Philosophical Enquiry into the Origin of our Ideas of the Sublime and Beautiful*. This achieved prominence for him both in London society, where he moved in the literary and artistic coterie of Samuel Johnson, David Garrick and Joshua Reynolds, and abroad. He was contracted to edit the *Annual Register* from 1758, for which he also wrote an annual political survey and the book reviews.

Burke's conservatism was founded on a deep and often explicit mistrust of metaphysics and abstraction, which for some commentators has rendered doubtful his status as a true political theorist, and even more so as a philosopher. The description of his writings as philosophical is further called into question by their occasional, polemical and often party-political character. However, these early mature writings - and a surviving notebook - reveal a pervasive sceptical epistemological position which is entirely consistent with, and arguably underpins his later political theory. In *A Vindication of Natural Society* Burke satirized the confident rationalism which the First Viscount Bolingbroke, in his posthumously published *Philosophical Works* (1755), had applied critically to religion. The *Vindication* was an ironic 'defence' of the state of nature, exercised through a hyperbolically rationalist critique of existing society, in a kind of *reductio ad absurdum* of Deist arguments (see Deism). A preface to the second edition clarified his concern to warn against the terrible consequences of applying human reason to areas beyond its very limited competence.

A year later his *Philosophical Enquiry* was published; seventeen English editions were produced in Burke's lifetime and the work was an important influence on European aesthetics. It was translated and discussed by Gotthold Ephraim Lessing in his *Bemerkungen über Burkes philosophische Untersuchungen (Remarks on Burke's philosophical enquiries)* (1758), absorbed by Denis Diderot, and was a significant influence on Immanuel Kant (see Beauty; Sublime, The). French and German translations were published in 1765 and 1773 respectively. The work was a resolutely empiricist enquiry into the experiential sources of our responses to the sublime and the beautiful rooted in Lockean sensationist psychology (see Locke, J.). Burke rejected the Third Earl of

Shaftesbury's claim to be able to derive moral or aesthetic standards from empirical observation, and implicitly criticized Francis Hutcheson in rejecting the ascription of a new 'sense' for each dimension of human response (see Shaftesbury, Third Earl of; Hutcheson, F.). He allied himself methodologically to Isaac Newton in seeking only to describe the phenomena actually observed or experience gained through introspection, and not going beyond that to hazard underlying general principles or forces at work.

Burke saw the sources of the beautiful in the social and pleasurable, those of the sublime in a vicarious appreciation of that which threatens self-preservation, and pain. It was thus, in an important sense, as Burke claimed, a 'theory of the passions' rather than a narrowly aesthetic work, and he stressed its relevance for all persons concerned with 'affecting the passions'. Burke was critical of a number of contemporary theories of beauty, including those neoclassical, utilitarian or Platonic theories which related it to 'proportion', 'fitness' or 'goodness'. Beauty was evoked by the soft, the smooth, and the delicate, and its affective power was by far the weaker of the two responses. Unsurprisingly, as has been pointed out by critics since Dugald Stewart, 'the idea of female beauty was uppermost in Mr Burke's mind when he wrote', and a particular conception of female beauty too: Burke's aesthetic is heavily gendered, a source of comment both for the modern psychobiographer and for feminist critics.

Burke's greater originality lay in his account of the much stronger principle of the sublime. Here, controverting established neoclassicism, Burke stresses the greater power of ideas that are obscure, indistinct and infinite. He anticipates romanticism in stressing the more intense emotional effects produced by imprecise images - and therefore by words, rather than painting, which suggest without delineating. He explains this power through the sublime's capacity to 'over-take our reason', which in turn derives from the inability of reason, on a Lockean account conceived of as the comparison of ideas, to operate where ideas are not (as the sublime never is) 'clear and distinct'. The power of the sublime is linked to religion and politics. Burke follows Hutcheson in drawing attention to the sublime effects produced by the obscurity of 'heathen temples' and the social distancing of political leaders, but goes beyond him in developing a distinction between the social virtues, which are associated with the beautiful response, and the political virtues, linked to austerity, power and the sublime.

2 The party-political pamphleteer

Burke's commitment to a political career began when he entered the service of Lord Rockingham, the opposition Whig leader, in 1765 and took a seat in Parliament later that same year. His most famous political pamphlets and speeches from that period include *Thoughts on the Causes of the Present Discontents* (1770) on party in politics; *On Conciliation with America* (1775) on the crisis with the American colonies; and *Speech on Mr Fox's East India Bill* (1783) on financial reform and on the reform of British India.

The political pamphlets are extremely issue-oriented, and invoke, rather than articulate, a conception of politics. Joining a century-long debate, Burke defends embryonic party association - 'when bad men combine, the good must associate' - on the basis of principled opposition, against the ministerial view that opposition parties were at the least 'factious', and possibly disloyal. His defence of party grouping *within* Parliament contrasts with his deprecation of it outside. In a famous speech to his Bristol constituents he rejected their right to organize so as to 'instruct' MPs, articulating a famous distinction between a representative and a delegate. Here as elsewhere Burke is looked back on as a founder or contributor to a Whiggish developmental account of constitutional practice, which it is not clear the historical record will sustain. In his speeches and writings on America he pursued a policy of reconciliation that stressed the futility of making stands on issues of principle which might never emerge, and could in any case never be enforced. His Economical Reform Bill of 1780, on the other hand, did pursue a principled distinction - between the King's private household finances and those of the Exchequer - seeking, for reasons widely urged, to extinguish the public financial sources of the Crown's influence and patronage threatening parliamentary independence.

These works fit broadly within an ideological position which derives in part from moderate oppositionist thought and Court Whig sentiments. Burke accepted the institutions of political and economic modernization, the importance of safeguarding credit and the moral and political role of a state Church - more especially in times of crisis. However, like opposition Whigs he wanted to limit the Crown's control of patronage through places and supply beyond parliamentary control, and he was anxious about the moral and political effects of Empire - especially where, as in the case of India, through enabling the creation of large fortunes which could be used to

buy political influence, and providing the experience of unconstitutionally restrained power, it threatened liberty at home. Another source of political destabilization in this political orthodoxy was insecurity of property. Despite Burke’s acceptance of modernizing Whig institutions - the Bank of England, a national debt and a market in stock and bonds - he was acutely aware of the potentially destabilizing effects of property speculation. The image of gambling as destructive of both individual rationality and social coherence haunted the eighteenth century since at least the South Sea Bubble, and Burke draws on all these resources when he comes to denounce in *Reflections on the Revolution in France* (1790) the Revolutionaries’ political economy and for their having reduced France to ‘one great play table’ and produced a people whose ‘impulses, passions, and superstitions [are] of those who live on chance’.

Despite their congruities with well-established patterns of argument, neither these, nor the works of his later, French revolutionary period, are in any sense works of systematic philosophy, as the *Philosophical Enquiry* is. Burke’s wider political position emerges episodically in parenthetical observations, epigrams and observations, which engage and resonate with a number of important political languages and issues of his time, and which only contentiously, and with some effort at reconstruction, constitute a political philosophy. One consequence of this is a considerable diversity of interpretation about Burke’s precise - or even general - theoretical location. Within the last hundred years Burke has been characterized as a utilitarian, a radical Lockean, a Court Whig, a natural law theorist, a common law theorist, and a proto-romantic.

3 Philosophical orientation

Even in the more theoretically-oriented political works is a series of issues of philosophical significance and in the treatment of which a broad continuity can be seen with Burke’s earlier works. Central among these are his fear of atheism; his conception of the political order as resting on an ‘opinion’ which is potentially unstable and a product of cultural and practical experiences; and a defence of tradition, both in substance, and on grounds sceptical of other sources of knowledge. In each of these cases it is an abstract ‘reason’ which Burke sees as the threat. Pride in the power of abstract reason fuelled the deist attacks on Christianity both in his youth and in Jacobin France. Philosophical speculation, especially when taken up by the politically inexperienced, detached people from valuable socialized dispositions and created political expectations and opinions which were not only unrealistic, in the sense of being cut adrift from the empirically validated institutions, practices and customs of the society, but positively harmful. For such abstract principles seemed to justify not merely the adjustment of institutions and practices to circumstance - a necessary condition, he recognized, for a tradition to incorporate and accumulate experience - but their reconstruction *de novo*. Such rationalist appraisal of tradition undermined the presumption in its favour necessary for its preservation, for although tradition provided real benefits in terms of social continuity and stable expectations, Burke believed that such a defence could be articulated with only the greatest of difficulty to the enthusiastic rationalist mind.

Burke’s response to the French Revolution (1790) was directed in particular at the language of radical natural rights, and the fear of its being imported to England. But the occasion of that fear was the Unitarian Richard Price’s sermon ’On the Love of our Country’, in which Price compared the deficiencies of Britain’s Glorious Revolution of 1688 to what the French were succeeding in achieving. Price’s religious rationalism was of the stamp Burke had attacked in his early *Vindication of Natural Society*. Radical deists (which Burke judged Unitarians to be) were now applying in earnest to politics those very arguments of religious rationalists which Burke had attacked in his youth when he had applied them ironically to politics. Natural right, far from providing a continuing standard of probity in political society, was inconsistent, Burke urged in Hobbesian fashion (see Hobbes, T.), with its very existence - the inconsistency being amply demonstrated by the fact that it is only in virtue of surrendering our natural rights that we can enjoy our civil rights. Conversely, in reasserting the former we effectively dissolve the social bonds. While this account seems to entail some version of social contract theory, Burke’s conception of the emergence of society is so historicized that such a contract cannot be the act of any one set of natural agents, but is rather a partnership across time and between generations. The corollaries drawn are that no one generation has the right to abrogate the contract, and exclude future generations from benefiting thereby, and moreover, that if such an abrogation were to occur, the re-establishment of society would be not an act, but a long and hazardous historical process.

Burke’s response to Price’s invitation to imitate France comprised, as well as an attack on radical natural rights

doctrine, a more general attack on abstract theory in politics, and an argument about English historiography and the status of 1688 - continued at some length a year later in his *Appeal from the New to the Old Whigs* (1791). To natural right, Burke opposed tradition; to rationalism, sentiment; and to the interpretation of 1688 as a failed revolution, the view of it as a desperate bid to sustain continuity - ‘a revolution not made but prevented’.

Burke had a complex conception of tradition owing much to Edward Coke, Hale and the English common law tradition. Custom - and even ‘prejudice’ - comprising the accumulated adjustment to circumstance of many generations, represented a kind of collective rationality which individuals cannot create. There was also, for Burke a sense in which, rational or not, the sustenance of such collective practices over time - or even the belief that they have been so sustained - constitutes the identity of the society.

Burke’s more general arguments against attempts to use rational criteria for social criticism focus on a number of deficiencies he had long identified in rationalism. A major feature was the indeterminacy of reason when not embedded in social practice. This insistence on social embeddedness has been a feature of much recent political debate, not only about values and principles but about personality itself. Burke here presages Hegel, as well as modern communitarians such as Ernest Mandel and Alasdair MacIntyre (see Community and communitarianism). For Burke, assessing the consequences of any social institution apart from an actual practice in its historical context is extremely hazardous, since its consequences and those of its fit with other institutions are unpredictable. The presumption in favour of natural right over positively existing institutions is a recipe for anarchy, for it represents an attempt to dissociate individuals from those shared beliefs and conventions which alone make social life possible. Even the assumption of majority decision-making, Burke points out, so far from being natural is a ‘violent fiction of positive law’. The indeterminacy of rationalism was psychological as well as logical: at an individual level moral rationalism left the individual perplexed as to how to apply a rule, whereas ‘prejudice renders a man’s virtue his habit’ and so provides an unhesitating and culturally appropriate response.

A second deficiency in reason - already famously stressed by Hume - was its ineffectual properties as a motivator. To replace traditional institutions and beliefs with rationalist schemes, however good, risked the failure of a people to adhere to them. The prejudicial partiality for one’s immediate family and locality, for known and accepted patterns of life, was the basis of any moral or political reality, both psychologically and in extent. The love of family and the ‘little platoon’ was the affective basis of ever-widening social circles through which we ultimately conceived affection for our country. By contrast, Price’s conditional patriotism, and the internationalism of the revolutionaries, Burke characterized as cold and ultimately ineffectual, leading to a love of humankind but not of any individuals. Moreover, the political consequences of abandoning custom and the motivating sentimental attachments to it would, Burke thought, be the increasing need to resort to coercion.

Burke identified British political culture as peculiarly suited to avoiding the intrusion of a-prioristic reasoning; it is praised as comprising a proper and continuing predisposition to conserve. The events of 1688 thus represented the successful avoidance of constitutional discontinuity at the price of some minor deviation in the line of descent. The principle of inheritance - in the monarchy and the Lords, as well as in the private property of family estates - links an important natural process - that is, reproduction - and natural sentiments - that is, family affection - to social practices conducive to continuity, and so to the epistemological collective benefits outlined above. Religion plays an important role in underpinning respect for these institutions, which might not otherwise be forthcoming, or might otherwise be undermined by a variety of processes at work in society, including moral or religious scepticism.

The French Revolution thus not only promulgated a political doctrine which Burke believed to be fundamentally flawed, but its actions - in undermining the Church and destabilizing property and even the currency - were destroying those institutions participation in which sustained shared patterns of belief and knowledge that comprised the community. Burke successfully predicted that a dictatorship would emerge from the atomized, institutionally dislocated or uprooted society.

Crucial to Burke’s pessimism is an Augustinian sense of humankind’s fallen and imperfect nature, from which we are preserved only by the painfully acquired veneer of civilization, which can be very quickly lost. Rejecting the Rousseauean art-nature polarity (see Rousseau, J.-J.), Burke affirms that ‘art is man’s nature’. It is nevertheless a second nature that is only acquired with care over a long time, and failure to acquire or sustain it reveals a savage and violent nature of a Hobbesian kind, which, Burke insists, will result from the reassertion of natural right.

Throughout the mid twentieth century Burke's thought was regularly appealed to by practising conservative politicians in Britain, and by American Cold-War ideologues. While much recent conservative thought has been so organized around the role of the market, as, in Burke's terms, to be the application of 'abstract' principle, a thinker such as Michael Oakeshott can be seen as operating in a recognisably Burkean intellectual environment.

Burley, Walter (*c*.1275-*c*.1345)

Active in the first half of the fourteenth century, Burley received his arts degree from Oxford before 1301 and his doctorate in theology from Paris before 1324. At one time a fellow of Merton College, he - along with Thomas Bradwardine, Richard Kilvington and others - became a member of the household of Richard de Bury, Bishop of Durham and served several times as envoy of the King of England to the papal court. Despite his extra-university activities, Burley continued to compose Aristotelian commentaries and to engage in disputations to the end of his life. A clear and prolific writer, Burley has been labelled an 'Averroist' and a 'realist' because of his arguments against Ockham, but it would perhaps be more accurate to see him as a middle-of-the-road Aristotelian whose intellectual activity coincided with the transition between the approaches of Thomas Aquinas and Duns Scotus on the one hand and those of William of Ockham and the Oxford Calculators on the other.

Born around 1275, Walter Burley became an Oxford Master of Arts sometime before 1301. He was a fellow of Merton College, Oxford in 1305, but by 1310 he was a student of theology at Paris. A colophon dated 1324 cites Burley as a doctor of theology. In 1327 Burley was appointed King Edward's envoy to the papal court, where he was again in 1343. In between, he was a member of the household of Richard Bury, Bishop of Durham, and conducted a disputation in Bologna in 1341. He probably died soon after 1344, when he is last mentioned.

Although Burley became a doctor of theology, he continued to write philosophical works throughout his life, commenting on all of Aristotle's logical works and on many of his other works as well, sometimes more than once. He also wrote independent treatises on philosophical subjects. Of his commentary on Peter Lombard's *Sentences* there is no known copy, nor are other explicitly theological works ascribed to him (although the *Tractatus primus* probably resulted from Burley's 'Principium' on the *Sentences*). His *De puritate artis logicae (On the Purity of the Art of Logic)* exists in a shorter version written about 1324 and a longer version written in 1325-8, responding to Ockham's *Summa logicae* of 1324. His commentary on Aristotle's *Physics* survives in manuscript in a version written before 1316; revised versions were printed many times, no doubt because of the commentary's completeness and clarity. Accurate, extensive quotations from earlier commentators are included.

In natural philosophy, Burley is best known for having held the 'succession of forms' theory of intension and remission, which treats qualitative forms, such as whiteness or heat, as similar to substantial forms, such as humanity. Each form is thought of as corresponding to one degree of quality. As a body is heated, at each instant it loses the degree of heat it had and acquires a greater degree. There are infinitely many indivisible degrees of heat, and between any two degrees there are other degrees. Godfrey of Fontaines had held a similar theory in explaining augmentation and diminution. In the later fourteenth century, most natural philosophers followed not Godfrey and Burley, but Duns Scotus, who had developed the so-called 'addition theory' of intension and remission: when a quality is intensified new parts are added, which produce a higher degree. Thus the previous degree of quality is not lost, as in the succession theory, but becomes part of the new degree. However, as long as the issue of how to explain the intension and remission of forms continued to be discussed, the succession theory was nearly always taken seriously.

Burley's treatise on first and last instants represents a standard view. For Burley, as for most other fourteenth-century authors, 'permanent' entities - that is, those that are wholly existent at once, unlike motion - have a first instant of being but no last instant. When water is heated and becomes air, there is a first instant at which the air exists but no last instant of the water. On the other hand, for 'successive' entities such as motions, there is neither a first instant at which the motion exists, nor a last instant of motion before the body comes to rest. Combining his ideas of first and last instants and his ideas of intension and remission, Burley argued in the *Tractatus primus* that all degrees of heat must be of the same species, rejecting such separate, contrary species as hotness, temperateness and coldness.

William of Ockham and other fourteenth-century nominalists such as John Buridan developed physical theories that minimized the types of entities in the world, maintaining that there are only substances and qualities unless there are special reasons for relaxing this rule. Burley, on the other hand, seems not to have been motivated by any preference for ontological parsimony. Thus, for Ockham, motion cannot exist separately from the moving body. Alteration as a kind of motion is simply the body altered and the degrees of quality (*forma fluens*) that it

successively takes on. Buridan adhered to Ockham's view for alteration, but relaxed it for local motion. If local motion were not something more than the body and the places it successively takes on, Buridan argued, then if God rotated the cosmos as a whole and there was nothing at rest to act as a reference point, it would be impossible to distinguish the cosmos in rotation from the cosmos at rest. Finding this conclusion unacceptable, Buridan concluded that in local motion there must be a flux (*fluxus formae*) as well as the places occupied. Burley, when confronted with similar questions, did not even try to develop a theory of motion that did not involve a *fluxus formae* as well as a *forma fluens*, but instead easily accepted the assumption that there is a *fluxus formae*. Likewise, while the nominalists emphasized that distances can exist and be measured only on bodies, so that when bodies move, the distances measured on them must likewise change, Burley took it as unproblematic that when two bodies are at rest, the distance between them remains the same, whether or not there is an unchanging body on which to measure the distance.

Because Burley belonged to no religious order, he has had no modern confrères interested in perpetuating a knowledge of his views. In the current state of scholarship, Burley appears more often as someone holding views contrasting with those of the nominalists than as someone whose theories are of interest for their own sake. Yet Burley's works were widely used, even after the advent of printing, probably more because of their thoroughness and clarity than because of the unique positions that Burley upheld. Burley's work would repay further study as a source of information about the views that were typical of early fourteenth-century scholasticism.

EDITH DUDLEY SYLLA

List of works

For a more complete list, see Weisheipl (1969) or Wood (1988b). Wood lists 50 surviving authentic works plus 17 lost, doubtful or spurious works. Included here are longer works and works that have received modern editions. For many more details on manuscripts and early printed editions of Burley's Aristotelian commentaries, including many works not listed here, see C. Lohr (1988) 'Medieval Latin Aristotle Commentaries', *Traditio* 24: 171-87.

Burley, W. (1301) *Quaestiones in Librum Perihermeneias (Questions on the Perihermeneias)*, ed. S. Brown, 'Walter Burley's Quaestiones in Librum Perihermeneias', *Franciscan Studies* 34, 1974: 200-95.(Twenty years later, Burley composed his so-called Middle Commentary on the *Perihermeneias* (ed. S. Brown, 'Walter Burley's Middle Commentary on Aristotle's Perihermeneias', *Franciscan Studies* 33, 1973: 42-134).)

Burley, W. (*c*.1302) *Obligationes (Obligations)*, part trans. in N. Kretzmann and E. Stump, *Logic and Philosophy of Language*, The Cambridge Translations of Medieval Philosophical Texts vol. I, Cambridge: Cambridge University Press, 1988, 370-412.(Burley's treatment of the common scholastic disputational exercise called 'obligations'.)

Burley, W. (*c*.1302) *Insolubilia (Insolubles)*, ed. M.L. Roure, 'La Problématique des propositions insolubiles au XIIIe siècle et au début de XIVe, suivie de l'édition des traités de W. Shyreswood, W. Burley and Th. Bradwardine', *Archives d'histoire doctrinale et littéraire du moyen âge* 37, 1971: 262-84.(Related to the previous work and perhaps composed at about the same time, this work treats those propositions that seem to falsify themselves, such as 'I am telling a lie.')

Burley, W. (early version pre-1316; later versions 1324-7 and 1334-7) *In Physicas Aristotelis. Expositio et Questiones (On Aristotle's Physics: Exposition and Questions (various revisions and titles))*, Pavia, 1488; Venice, 1482, 1491, 1501 (repr. Hildesheim: Olms, 1972), 1508; Bologna, 1589.(Existing in several versions, Burley's exposition of and questions on Aristotle's *Physics* combined a detailed passage-by-passage explanation of Aristotle's text, and often of Averroes' commentary on it, with occasional digressions to answer questions or doubts.)

Burley, W. (before *c*.1316?) *Tractatus expositorius super libros posteriorum Aristotelis (Expository Treatise on the Books of Aristotle's Posterior Analytics)*, Venice, 1497, 1504; Oxford, 1517; repr. of edition with Robert Grosseteste's *In Aristotelis Posteriorum analyticorum libros*, Frankfurt: Minerva, 1966.(Burley's commentary on the *Posterior Analytics*.)

Burley, W. (before 1320?) *Tractatus de suppositionibus (Treatise on Supposition)*, ed. S. Brown, 'Walter Burleigh's Treatise *De Suppositionibus* and its influence on William of Ockham', *Franciscan Studies* 32, 1972: 15-64.(Burley's work on a central concept of the new logic.)

Burley, W. (1320-3) *Tractatus de formis (Treatise on Forms)*, ed. F.J.D. Scott, Veröffentlichungen der Kommission für die Herausgabe ungedruckter Texte aux der mittelalterlichen Geisteswelt, Bd. 4, Munich: Verlag der Bayerischen Akademie der Wissenschaften, 1970.(One of Burley's shorter works that has received

a modern edition, this provides a general overview of Burley's theory of forms. Various other short, mostly logical works have been edited by H. Shapiro and various collaborators; see Murdoch and Sylla (1970) for details.)

Burley, W. (1320-7) *Tractatus primus* or *Tractatus de activitate, unitate et augmento formarum activarum habaentium contraria et suscipientium magis et minus (First Treatise, or Treatise on the Activity, Unity and Augmentation of Active Forms Having Contraries and Undergoing More or Less)*, MSS Bruges, Stadsbibl. 501, 70r-105r; Vat. lat. 817, ff. 203-223r.(Exists only in manuscript form. Contains Burley's theory of the succession of forms in its formative stages.)

Burley, W. (after 1327?) *Tractatus secundus or Tractatus de intensione et remissione formarum (Second Treatise, or Treatise on the Intension and Remission of Forms)*, Venice, 1496.(The mature statement of Burley's succession of forms theory and of its justifications. For a discussion, see Maier (1968).)

Burley, W. (1320s?) *Utrum contradicto sit maxima oppositio (Whether Contradiction is the Maximum Opposition)*, ed. R. Palacz, 'Gualterii Burleii Quaestio: Utrum contradicto sit maxima oppositio (MS. Vat. Ottob. 318, f. 141va-145vb)', *Mediaevalia Philosophica Polonorum* XI, 1968, 128-39, 152-6; ed. L.M. de Rijk, 'Burley's So-called *Tractatus Primus*, with an Edition of the Additional Quaestio "Utrum contradicto sit maxima oppositio"', *Vivarium* 34, 1996: 161-91.(Brief logical work.)

Burley, W. (1320s?) *De exclusivis (On Exclusions)*, ed. L.M. de Rijk, 'Walter Burley's Tract *De exclusivis*: An Edition', *Vivarium* 23, 1984: 23-54.(Brief logical work.)

Burley, W. (1320s?) *De exceptivis (On Exceptions)*, ed. L.M. de Rijk, 'Walter Burley's *De exceptivis*, an Edition', *Vivarium* 24, 1986: 22-49.(Brief logical work.)

Burley, W. (shorter version before 1324; longer version 1325-8) *De puritate artis logicae (On the Purity of the Art of Logic)*, ed. P. Boehner, St. Bonaventure, NY: Franciscan Institute, 1955; section on consequences trans. in N. Kretzmann and E. Stump, *Logic and the Philosophy of Language*, The Cambridge Translations of Medieval Philosophical Texts vol. I, Cambridge: Cambridge University Press, 284-311.(A typical fourteenth-century textbook of new logic, which may be compared to Ockham's logical works to see the points on which fourteenth-century logicians tended to agree or disagree with each other.)

Burley, W. (before 1327) *De primo et ultimo instanti (On the First and the Last Instant)*, ed. H. Shapiro and C. Shapiro, *Archiv für Geschichte der Philosophie* 47, 1965: 157-73.(This is a working rather than critical edition of Burley's ideas concerning first and last instants.)

Burley, W. (*c*.1333-41) *Exposition super libros Ethicorum Aristotelis (Exposition of the Books of Aristotle's Ethics)*, Venice, 1481, 1500.(Towards the end of his life, Burley continued to compose commentaries on the major works of the Aristotelian corpus.)

Burley, W. (final version 1337) *Expositio super artem veterem Porphyrii et Aristotelis (Exposition of the Old Art of Porphyry and Aristotle)*, Venice, 1481, 1497 (repr. Frankfurt: Minerva, 1967), 1519 and many others.(A commentary on the old logic.)

Burley, W. (1340-3) *Expositio super librum Politicorum (Exposition on the book of Politics)*.(Exists in many manuscripts, though relatively neglected by recent scholars.)

pseudo-Burley (?) *De vita et moribus philosophorum (The Lives and Customs of the Philosophers)*.(Previously thought to be by Burley; see J. Prelog (1990) 'De Pictagora phylosopho. Die Biographie des Pythagoras in dem Walter Burley zugeschriebenen Liber de vita et moribus philosophorum,' *Medioevo. Rivista di storia della filosofia medievale* 16: 191-251.)

Burthogge, Richard (*c.*1638-*c.*1704)

Richard Burthogge, perhaps the first but certainly not the least interesting modern idealist, was a minor philosopher who responded to a variety of English and Dutch influences. His epistemology, constructed as an undogmatic framework within which to debate theological and metaphysical issues, contains remarkable resemblances to later, even recent idealism. He argued that, since our faculties help to shape their objects, we never know things as they are in themselves: all the immediate objects of thought are appearances. 'Metaphysical truth' is therefore beyond us, but we approach 'logical truth' in so far as our notions harmonize or cohere with one another and with experience. In this spirit, Burthogge advocated a tolerant reasonableness in religion, while in metaphysics he postulated a universal mind, united with matter, of which individual minds are local manifestations.

1 Life

Richard Burthogge was born in Plymouth, England, and educated at Exeter Grammar School, at Oxford (B.A. 1658) and at Leiden in Holland (M.D. 1662). He returned to his native Devon and became a prosperous medical practitioner. His first theological works, *Divine goodness* (1672) and *Causa Dei* (1675), wrestled with the problems of evil, grace and divine justice. *Organum Vetus et Novum* (1678) was Burthogge's epistemological response to the 'Proud *Ignorance*, Ignorant *Zeal*, and Impertinent Reasoning' of his critics. It rested on an anti-dogmatic probabilism characteristic of such advocates of toleration as William Chillingworth and the Cambridge Platonists (see Cambridge Platonism), together with a thesis which Burthogge could have heard expounded in Leiden by Geulincx, that the objects of logic and knowledge are shaped by the forms of our understanding. Between 1684 and 1691 further works called for 'a general toleration', and attempted to settle religious disputes by 'harmonious' interpretation of scripture and historical evidence. In 1694 *An Essay upon Reason, and the Nature of Spirits* set out Burthogge's theory of knowledge as prolegomenon to a theory of mind which, although dualistic, owed something to Spinoza. This work was also influenced by Locke, to whom it was dedicated and with whom a correspondence ensued. *Of the Soul of the World, and of Particular Souls* (1699), again addressed to Locke, gave further arguments for Burthogge's hypothesis. The Calvinist doctrine of predestined salvation was attacked once more in *Christianity a Revealed Mystery* (1702), an unorthodox exegesis of *Romans* VIII.28-30. In 1703 this argument was pursued in letters to Locke, who then offered the same interpretation in his *Paraphrase* of St Paul. It seems not to be known when Burthogge died.

2 Theory of knowledge

Burthogge's fundamental epistemological principle, expounded in both *Organum* and *An Essay*, is that things are known by us only as they are in our faculties (that is sense, imagination and understanding), and that 'Every Faculty hath a hand, though not the sole hand, in making its immediate Object'. Philosophers recognize that 'Colours are [not] without the Eye… although they seem so to Sense' (1678: 13-14). Yet the understanding equally 'doth *Pinn* its Notions upon Objects' (1694: 58): substance, accidents, powers, similitude, whole, part, cause, effect and so on 'own no other kind of Existence than… an Objective [that is, intentional] one'. Yet it does not follow that nothing is real, since intentional or 'cogitable' beings are characteristically grounded in realities: 'Notions of the Minde are *bottomed* on *Sentiments* of Sense; so that as Realities are Grounds to Sentiments, so Sentiments are Grounds to Notions' (1678: 15-16). The hinge here is our awareness in sensation that external realities are acting on us - just that awareness which masks the contribution of the faculty itself. Voluntary fictions obviously lack such grounding, while, although sensory illusions and dreams are both 'real' in having causes outside the mind, in the former case the causes are unusual, and in the latter they are 'Causes only, and not Objects as well as Causes' (1694: 78).

Understanding, it is explained in *An Essay*, arises from sense by means of language. Words are images which aid thought either by calling other images or notions to mind or by standing in place of them. Indeed, ideas of the understanding are nothing but definitions, both 'of words' and 'made by words'. This allows for notions of things 'perfectly intelligible and mental', but such notions are necessarily shaped by language and even further from reality than the images or sensations on which they are based (1694: 27-34).

Burthogge recurs to the traditional point that to apprehend something through an attribute is to apprehend it

imperfectly under a notion or aspect or *modus concipiendi*, and yet we can only apprehend things through their attributes. In *An Essay* this thought is developed on Lockean lines: our experience is only of qualities, but we conceive 'that other things are under them, which do uphold and support them, and consequently, that are *subjects*, or substances' (1694: 98) (see Locke, J. §§4-5). In *Organum*, Burthogge had emphasized a comparison with our imperfect knowledge of God. As to know God through his attributes is to know him only by analogy, so in general 'to us men *things* are nothing but as they stand in our *Analogie*' (1678: 12). There is, however, a difference between the Light of Faith and the Light of Reason. Revelation supplies analogies for spiritual, rather than natural things. They should be employed as such, and reason should endeavour to harmonize them, but none should be insisted on 'as if it were adequate, or just'. Still less should they be used in opposition to natural reason (1678: 26-34).

Organum also contains what is perhaps the clearest and most forthright statement of a coherence theory of truth in the seventeenth century (see Truth, coherence theory of). Because we cannot get behind our notions, 'metaphysical truth' is of no concern to us. 'Logical truth', however, when 'rightly shewn', is naturally distinguished by the understanding. The criterion of logical truth cannot be the Stoic or Cartesian clear and distinct perception, since any criterion must lie in the object, not in the way in which we perceive it. Nor does it lie in innate tendencies or principles. Truth, as the ground of assent, is the objective harmony, congruity and coherence of things 'in the Frame and Scheme of them in our Mindes'. Natural reasoning assumes a harmonious world as the object of a unified science: in 'science as it is in Arch-work, the Parts uphold one another'. To prove something is to fit it into 'a Scheme and Frame of Notions bottomed on things'. Any hypothesis is in principle vulnerable to a more coherent hypothesis, but to doubt without reason is 'unreasonable and contradictious' (1678: 47-60).

3 Theory of mind

In contrast to Locke, Burthogge argues in *An Essay* that, despite our ignorance of their real natures, we cannot suppose that mind is a power of matter; nor can we, with Spinoza, suppose them identical (see Locke, J. §5; Spinoza, B. de §§5-6). Since the attributes through which we distinguish them, extension and thought (and, with thought, agency), are mutually irreducible by us, we simply have to abide by our 'Refracted, Inadequate, *Real-Notional* way of conceiving' (1694: 107). Pure matter appears as passive; pure mind, which is God, as active. Mind as we know it in ourselves and in animals, however, appears inextricably 'concreted' with matter. Experience shows that reason itself requires a properly working organ. The best hypothesis is that everything in nature is a combination of matter with a universal spirit which activates and controls it. The species of living, sensitive and rational things are produced according to the 'Texture and Quality' of their material structure. The organs of perception and thought 'catch and retain' specific forms of cogitation as a mirror catches an image from motions in the medium, or a glass catches the vibrations of a lute-string. Without matter so in harmony with mind, there would be no individuation of thoughts or, indeed, of souls, which are 'portions' of 'the Soul of the World'. This panpsychist hypothesis allows that human souls are generated in the same general way as animal souls, a piece of common sense doubted only by the Cartesians.

Bushi philosophy

Bushi *is one of several terms for the warrior of premodern Japan;* samurai *is another. The 'way of the warrior' - that is, the beliefs, attitudes and patterns of behaviour of the premodern Japanese warrior - is commonly called* bushidō *(literally, the 'way of the* bushi*'). However,* bushidō *is actually a phrase of rather late derivation, and in premodern times was never exclusively used to describe the warrior way.*

Two of the earliest and most enduring phrases for the way of the warriors who rose in the provinces of Japan in the late ninth and tenth centuries were the 'way of the bow and arrow' and the 'way of the bow and horse'. These phrases, however, referred to little more than prowess in the military arts, the most important of which, as the second phrase clearly specifies, were horse riding and archery. For many centuries no one in Japan undertook to define systematically what the way of the warrior in a larger sense was or should be. Warrior beliefs, ideals and aspirations - including loyalty, courage, the yearning for battlefield fame, fear of shame and an acute sense of honour and 'face' - were widely recognized, but neither warriors nor others apparently felt the need to codify them in writing.

*Not until the establishment of the Tokugawa military government (shogunate) in 1600, which brought two and a half centuries of nearly uninterrupted peace to Japan, did philosophers begin to study and write about the warrior way (*bushidō*). Concerned about the meaning and proper role of a ruling warrior class during an age of peace, philosophers posited that warriors should not only maintain military preparedness to deal with fighting that might occur, but should also develop themselves, through education based primarily on Confucianism, to serve as models and moral exemplars for all classes of Japanese society.*

1 Early beliefs

A warrior class emerged in the provinces of Japan in the late ninth and tenth centuries because the court government in Kyoto, headed by an emperor but administered mainly by regents of the Fujiwara family, left local governance largely to local families. In the absence of firm control from the court, men of locally powerful families, holding offices in provincial and district governments, took up arms to maintain the peace and deal with disputes over land and other issues.

However, with few exceptions, these warriors did not seek to assert their independence from the Kyoto court. On the contrary, they often turned to the court for support in conflicts with other warriors or officials. They also greatly respected and admired court society and culture. In ensuing centuries, warriors repeatedly sought to obtain court ranks and offices, even though these might be purely ornamental, and to acquire knowledge of court culture. A distinctive feature of the warrior way as it evolved over the ages was the steady acquisition by warriors of courtly ways. As the records put it, warriors combined the *bun* (the courtly and cultural) with the *bu* (the military).

As warrior bands formed and contended for local and regional power in the middle and late Heian period (794-1185), they evolved feudal institutions very similar to the feudalism of western Europe in its medieval age. Chief among these institutions was the lord-vassal relationship. Chronicles known as war tales, records of the lives and battles of warriors, depict the intimate personal attachments that bound lords and vassals, telling of vassals prepared to give their lives for their lords at a moment's notice and of lords who bestowed upon vassals the kind of love normally given by fathers to their sons. Of course, not all warriors behaved like the idealized characters of the war tales; but the tales presented models for ages to come of how warriors ought to conduct themselves, especially in their roles as lords and as vassals.

As noted above, warriors fought primarily on horseback with the bow as their principal weapon. In battles between armies, warriors usually paired off to contend one-against-one, using their swords when they entered into close combat. Since it was difficult to kill an enemy with a sword from horseback, the warrior tried to unseat his foe, then leap down and stab him to death. Although in later centuries the sword came to be looked upon as the soul of the warrior, in this early age the warrior's great pride lay in his skill with the bow, wielded while riding a horse.

From earliest times the warrior displayed great pride in *na* (name), a term that connoted not only a sense of pride in family but also a determination to uphold personal honour and to achieve fame on the battlefield. Concern about *na*, however, had the potential to conflict with the warrior's obligation of loyal service to his lord. The warrior

anticipated reward for victory in battle; and indeed usually received from his lord a portion of the lands and other wealth seized from defeated enemies. However, if the warrior pursued his own interests too aggressively in a battle - not only in the quest for material reward but also to achieve personal fame and glory - he could be difficult to command and could even undermine his lord's battle strategy.

The converse of the warrior's pride in name and thirst for fame was his fear of shame. The warrior was of course shamed if he was perceived to be timid or cowardly, but shame could also be experienced simply by defeat in battle, no matter how well a warrior had fought. The war tales often speak of warriors driven by the single-minded desire to expiate shame, suggesting that shame was a major factor in the frequent undertakings of revenge that we find in warrior history. In later centuries, the pursuit of revenge became institutionalized in the vendetta.

2 The warrior way in the age of the country at war

One of the most important periods in the shaping of the warrior way was the *sengoku jidai*, the 'age of the country at war' (1478-1573). The Ōnin War, fought largely in Kyoto during the decade 1467-77, destroyed Kyoto and plunged Japan into a state of disunion and conflict that lasted nearly a century. Beginning about 1500, territorial domains were established by warrior chieftains whom historians call *daimyō*, and through much of the early and middle sixteenth century these *daimyō* fought fiercely among themselves. Finally, one of the *daimyō*, Oda Nobunaga, emerged as a unifier. Entering Kyoto in 1568, Nobunaga began a process of national unification that was completed in 1590 by his vassal and successor, Toyotomi Hideyoshi.

So intense and widespread was the fighting in the *sengoku* age that there were real fears it would tear apart the social fabric of Japan. Warrior values were sorely tested; indeed, some were openly abandoned. If the lord-vassal relationship, based on the vassal's loyalty to his lord and the lord's loving care of his vassal, was the essence of Japanese feudalism, then feudalism fared poorly in the *sengoku* age. This was a time of frequent, outright treachery, which witnessed *daimyō* violating treaties with impunity and vassals betraying their lords or simply abandoning them in favour of those who offered richer rewards.

It is instructive to note that, in the legal codes they compiled for their domains, the *daimyō* of the *sengoku* age said little about loyalty but a great deal about disloyalty. Hereditary (*fudai*) vassals - that is, vassals whose families had served a *daimyō* house for generations - were expected to be loyal. Non-hereditary (*tozama*) vassals, on the other hand, were not only not held to high standards of commitment and loyalty, they were scarcely criticized if they shifted from one *daimyō* to another, seeking a better (more powerful and more generous) lord.

The *daimyō* especially feared fighting between vassals, which could cause serious ruptures in both their armies and their governments. To prevent such fighting, they included in their domainal codes what can be called 'no questions asked' laws. These laws specified that, if two vassals began to fight, both would be punished without any inquiry into the cause of the clash. The more powerful *daimyō* decreed that the punishment for fighting between vassals was death. The vassal of one prominent *daimyō*, however, charged that the 'no questions asked' law went against the warrior's 'manly way' (*otoko no michi*), since it encouraged the warrior to restrain himself even if insulted or otherwise provoked. The vassal said that warriors worthy of being called warriors had to be aggressive, ready to fight whenever challenged, and predicted that the 'no questions asked' law would nurture meek, if not cowardly, vassals.

A major event during the *sengoku* age was the appearance of Europeans in Japan for the first time. The first Europeans to set foot on Japanese soil were Portuguese traders who arrived in 1543 in a Chinese junk. Soliciting trade, the Portuguese introduced the Japanese to Christianity and guns (muzzle-loading muskets); during the ensuing century, trade, Christianity and guns became the main staples of intercourse with Europeans. Japanese warriors had been exposed to the use of gunpowder during the two unsuccessful invasions of Japan by Mongol troops in 1274 and 1281. However, this exposure had not led to any significant experimentation with gunpowder by the Japanese themselves during the next three centuries. Hence, we may suppose that the Japanese were utterly astonished when they first observed the firing of guns by the Portuguese. Immediately recognizing the extraordinary value of guns for warfare, the *daimyō* of the *sengoku* age eagerly sought to acquire them. However, guns were not readily obtainable; the Portuguese could only import so many, and establishing gun foundries in Japan was expensive. Some important battles were won with guns in the late sixteenth century, but by the time guns became widely available around 1600, the fighting had ceased. Thus guns did not revolutionize warfare in

Japan during this period. Had they done so, they would surely also have undermined if not destroyed the special status of the warrior or *samurai* class. As it was, the 'way of the warrior' remained the way of elite fighters specially trained in the complex military arts of horsemanship, archery and use of the sword.

3 The Tokugawa period and the concept of *bushidō*

With the establishment of the Tokugawa shogunate in 1600, Japan's ruling warrior class lost its principal *raison d'être*, which was fighting. No one could have known at the time that peace would prevail, with few exceptions, for more than two and one-half centuries. Hence, throughout the seventeenth century at least, the rulers of the shogunate were absorbed first and foremost with security, taking measures to prevent a reversion to the bloodshed and chaos of the *sengoku* age.

One of the most important steps that had been taken to end the warfare, unify the country and make unification lasting was the separation of peasants and warriors. In the late sixteenth century, those warriors who had not already done so were obliged to move from the countryside into the castle towns of their *daimyō*; simultaneously the peasants, who were ordered to remain in their villages, were disarmed in a national 'sword hunt' that deprived them of their swords and other weapons.

Removed from the land and transformed into urban residents, warriors became stipendiaries, the recipients of regular stipends based on the revenue derived from agricultural fiefs held by them or their ancestors during the *sengoku* age. High-ranking warriors received, for the most part, generous stipends and were employed by their *daimyō* in the domainal governments. Those on the lower end of the warrior scale were usually not so employed and were obliged to get along on meagre stipends.

The existence of a large number of idle stipendiaries among the warriors troubled philosophers. Yamaga Sokō(1622-85), a Confucian scholar whose name is closely associated with the formulation of *bushidō* during the Tokugawa period (although he himself used the abbreviated term *shidō*), observed: '… the *samurai* eats food without growing it, uses utensils without manufacturing them, and profits without buying or selling. What is the justification for this?' (Tsunoda *et al.* 1958: 398). Sokō's answer was that the function of the *samurai* in society was to serve his lord loyally and to stand as an exemplar of high moral standards to the lower classes, peasants, artisans and merchants. The acquisition of high moral standards - that is, Confucian moral standards - was premised on the acquisition of education (see Confucian philosophy, Japanese).

Strongly influenced by the thought of Yamaga Sokō, *bushidō* came to comprise two parts. The first part was military preparedness and a romantic looking back to the great fighting traditions of the past. Countless editions of the war tales and other records of ancient and medieval battles, biographies of the great warrior heroes of the past and the like were published during the Tokugawa period. In addition, many schools in military tactics and the martial arts were founded, including one by Yamaga Sokō.

The second part of *bushidō* concerned the ethical training urged by Sokō. This not only resulted in the articulation of an ethical code for warriors of a kind that we do not find prior to the Tokugawa period, but also greatly stimulated education in general among warriors. Hence, *bushidō* contributed importantly to the evolution of the warrior class as an intellectual as well as ruling elite.

If the *bushidō* just described was based primarily on Confucian rationalism, there was another *bushidō* nurtured by a different, powerfully 'irrational' school of thought. This school derived from the belief, adumbrated above in the discussion of the feudal lord-vassal relationship, that vassals ought to serve their lords in a spirit of absolute self-sacrifice: vassals should, indeed, be prepared to relinquish their lives in a moment's notice for their lords. The war tales, for example, speak of vassals who considered their lives as no more important than a 'speck of dust' or a 'goose feather' in the service of their lords.

The bible of this irrational school of *bushidō* was the *Hagakure*, an early eighteenth-century compilation of the views of Yamamoto Tsunetomo, vassal to the *daimyō* of a western domain. In one of the most famous proclamations in all of Japanese literature, Tsunetomo asserts in the *Hagakure* that: 'The way of the warrior (*bushidō*) is found in death' (trans. Wilson 1979: 17). But, as Tsunetomo explains, it is not sufficient for the warrior to be resigned to the fact that he may be killed. He must be prepared at all times to face death at a moment's notice, and when confronted with a situation in which he must decide between living or dying, he should

unhesitatingly choose to die. In such a situation there can be no calculating or 'rationalizing'. The warrior must fight like a madman to his death, even though aware that others may later judge his actions to have been wrong or foolish. Utterly unconcerned about 'achieving' anything, the true warrior devotes himself single-mindedly to acting in a death-defying - or more precisely, a death-attaining - way.

The *Hagakure*, with its extreme views about proper warrior behaviour, was written after the passage of a century of Tokugawa peace and during a time (the Genroku cultural epoch) that celebrated the lives of merchants and artisans, whose chief goals in life were to earn money and enjoy the luxuries it could buy. Genroku culture was totally antithetical to traditional warrior values, at least as those values were idealized in writings like the war tales. A *cri de coeur* against what Yamamoto Tsunetomo viewed as the moral deterioration of the times, the *Hagakure* was an anachronistic attempt to rally the spirit of the warrior class, most of whose members could only have been bewildered at the prospect of rushing to their deaths in an age when warfare had been suspended for so long that no one had any experience of it.

But in fact, an incident had occurred just a few years before the publication of the *Hagakure* that seemed to suggest that the traditional warrior values centred on the selfless service of vassals to their lords, which Yamamoto Tsunetomo so admired and so yearned to revive, were still alive. One of the most famous events in all of Japanese history, this incident was the sensational revenge of the forty-seven *rōnin* (masterless *samurai*). In 1701, a *daimyō* in attendance at the shogun's castle in Edo (modern Tokyo) assaulted and wounded one of the shogun's officials. For having drawn his sword in the castle the *daimyō* was condemned to death, and that same day he disembowelled himself - that is, he committed *seppuku*, the warrior's way of suicide. Two years later, a group of the *daimyō*'s vassals, who had become *rōnin* because of their lord's death, fulfilled a secret pact by attacking the residence of and killing the official the *daimyō* had assaulted (the exact reason for the assault is not known). Seven weeks later the *rōnin,* condemned to death for violating shogunate law, themselves committed *seppuku*.

Although this act of revenge - this carrying out of a vendetta (*katakiuchi*) - has stirred the spirits of many Japanese over the years, it was in fact an isolated incident and not in any sense illustrative of the way warriors behaved or were expected to behave. Yamamoto Tsunetomo in fact criticized the *rōnin* because they did not spring into action immediately against the enemy of their lord but instead calculated and schemed for two years. More fundamentally, this vendetta was unusual because nearly all the other vendettas by warriors during the Tokugawa period were based on avenging kin rather than feudal lords.

Nevertheless, the revenge of the forty-seven *rōnin* was important in the history of *bushidō* because it drew attention to the special character of the lord-vassal relationship among warriors, reaffirming the ideal of vassals acting selflessly, even to the point of forfeiting their lives, in the service of their lord. In the modern age, after the dissolution of the *samurai* class and the establishment of a conscript army, this spirit was still held to set Japanese soldiers apart from those of other countries. Even as late as the Second World War the spirit of the Japanese soldier, prepared to die if necessary for his emperor, was exalted and accorded special consideration in the strategic planning of many Japanese commanders.

Business ethics

Business ethics is the application of theories of right and wrong to activity within and between commercial enterprises, and between commercial enterprises and their broader environment. It is a wide range of activity, and no brief list can be made of the issues it raises. The safety of working practices; the fairness of recruitment; the transparency of financial accounting; the promptness of payments to suppliers; the degree of permissible aggression between competitors: all come within the range of the subject. So do relations between businesses and consumers, local communities, national governments and ecosystems. Many, but not all, of these issues can be understood to bear on distinct, recognized groups with their own stakes in a business: employees, shareholders, consumers, and so on. The literature of business ethics tends to concentrate on 'stakeholders' - anyone who occupies a role within the business or who belongs to a recognized group outside the business that is affected by its activity - but not in every sort of business. Corporations are often discussed to the exclusion of medium-sized and small enterprises.

Theories of right and wrong in business ethics come from a number of sources. Academic moral philosophy has contributed utilitarianism, Kantianism and Aristotelianism, as well as egoism and social contract theory. There are also theories that originate in organized religion, in the manifestos of political activists, in the thoughts of certain tycoons with an interest in social engineering, and in the writings of management 'gurus'. Recently, business ethics has been affected by the ending of the Cold War, and the breakdown of what were once command economies. These developments have encouraged enthusiasts for the market economy to advocate moral and political ideas consistent with capitalism, and the handing over to private companies of activity in certain countries that has long been reserved for the state.

1 Stakeholders and the range of business ethics

The concept of the stakeholder - someone who occupies a role within the business or who belongs to a recognized group outside the business that is affected by its activity - lies at the centre of business ethics. The literature tends to concentrate on stakeholders in bigger companies on the American model: companies quoted on stock exchanges, with impressive turnovers, large numbers of employees, and several layers of management. Such companies are involved with a wide range of stakeholders, both internal and external to the organization. The 'internal' stakeholders include directors, managers, ordinary shop-floor or 'blue-collar' employees, and shareholders. Outside the company there are customers, suppliers, competitors, local communities, and one or more levels of government. Business ethics as a whole may be regarded as a unified understanding of the obligations of those who run a business - directors or top managers - to the rest of a business' stakeholders. Alternatively it may be seen as a unified understanding of the typical ethical risks or problems facing the internal stakeholders in their dealings with one another and outsiders. Both conceptions are well represented in the literature, and both accommodate the central issues of business ethics.

2 Internal stakeholders: the case of employees

Perhaps the leading 'internal' stakeholders of a firm are its employees, whose fortunes depend on those of the firm in the most direct way. The firm may be the only source of income for each of its employees, and the income may be used to support many others. Employees may depend on their job for a considerable proportion of their social life and their most rewarding activity. Having a particular job, or having a job at all, may be an important source of self-esteem (see Work, philosophy of). With so many connections to the good things in life, the role of employee cannot fail to matter morally. Equal opportunity and employment protection legislation reflect the importance of having and keeping a job. In many industrialized countries discrimination in recruitment on the grounds of race or sex or religion is against the law. In western Europe dismissal from a full-time job can be legally challenged, and redundancy can be accompanied by significant financial compensation. Different types of employee have different sorts of stake in different businesses, and businesses have different stakes in different employees. A worker on the factory floor and the manager above him are both employees, but their roles in the firm are likely to make different moral demands on them and their employers. It may fall to the manager to sack factory workers for some offence or to make them redundant during a recession. It may fall to a worker to make known a costly production defect or to complain of harassment by someone higher up in the organization. The manager may strongly disagree with the

decision to sack the workers, and yet be responsible for carrying it out. The worker may wonder whether making known the defect will indirectly cost them their job: putting right the defect may be expensive, and redundancies may be the firm's way of covering its losses. On the other hand, if the defect is not made known, perhaps the safety of a very large number of consumers will be threatened. Serious consequences may also attend the report of harassment. The complainant risks not being believed, and probably the embarrassing details will be made the subject of gossip. Perhaps the person complained about will retaliate in some way. And the firm may be forced to decide between two employees, neither of whose talents it can afford to lose.

Not every moral theory is suited to weighing what is at stake in such cases, and several different theories may be required to do justice to all stakeholders in business ethics. Utilitarianism and Aristotelianism have resources for capturing the value of employment in general, since each works with a concept of wellbeing or welfare which embraces many different goods, including those associated with having a job (see Utilitarianism; Aristotle §21). Kantianism is able to give weight to the way in which consumers are put at risk by not publicizing the production defect, and the way in which the wellbeing of employees can be sacrificed for a short-term reduction in the costs of a business (see Kantian ethics). Kantianism is also able to make sense of the wrong of harassment, and therefore to justify a decision to press a complaint against harassment. In all of these cases, albeit in different ways, persons are treated as means, and Kantianism highlights such treatment as a kind of immorality. Aristotelianism is sometimes thought to be able to coordinate the moral demands that fall on people in their role as manager or worker with the moral demands that fall upon them in the rest of their lives. The manager who is uncomfortable with sacking people may be someone who tries to pursue a policy of benevolence or charity whenever possible. The worker who balks at overlooking the production defect in the factory may be in the habit of being honest and open away from work.

Aristotelianism prescribes the cultivation of patterns of behaviour that serve one in one's private as well as in one's public life, and that cannot be abandoned without a morally significant loss to the agent. Utilitarianism and Kantianism, on the other hand, sometimes diagnose the reluctance to depart from characteristic patterns of behaviour as a kind of squeamishness or self-indulgence. Sacking the workers may be unpleasant, according to these theories, but it may be best on balance for everyone, or necessary if one is to honour promises to shareholders or creditors.

3 External stakeholders: social responsibility

It is not only Kantianism, utilitarianism and Aristotelianism which are invoked to deal with the obligations of a firm to the wider world. Sometimes the firm is said to be party to a social contract which confers a duty to transfer profits or services to the communities in which it operates, in return for the good will or custom or labour of members of those communities (see Contractarianism). Sometimes it is said to be in the firm's self-interest to benefit communities. These things are said, at any rate, by those who think that businesses have obligations to external stakeholders at all. There are well-known advocates of the view that company philanthropy within a host community violates a prior and overriding obligation of a firm to its shareholders. The more profit or employee time is diverted to noncommercial and non-profit-making activity, so it is argued, the less there is to redistribute to shareholders, who after all own the company and invest in it usually on the understanding that the company will maximize returns to them.

The view that firms have no business helping the community is now widely contradicted by the behaviour of large commercial enterprises themselves. The directors of such enterprises accept that philanthropy is often expected by local communities and shareholders alike, and sometimes endorsed by consumers in the form of greater approval for, and loyalty to, firms that go in for it. In the UK retail sector, for example, market research has confirmed the commercial benefits of a caring public image.

If it is in the interest of firms to give money or time to helping the community, and if they give the help because of the commercial benefits, is the help morally creditable? Much depends on whether the help is given only for the commercial benefits. If it is only for the commercial benefits, then probably only egoism - the theory that something is right if and only if it serves one's own interest - makes the act moral, and egoism is strongly counterintuitive as a moral theory (see Egoism and altruism). On the other hand, although business people see the value of self-interest, it is uncharacteristic for them to say or think that acts of corporate charity serve only self-interest. Perhaps they would not go in for donations of money or time if they were not going to pay the firm in

some way; this does not mean that nothing else matters. The motivation can be mixed, as it is when directors of enterprises themselves have strong philanthropic impulses, but can also see that the philanthropy will be good for public relations. In the case where the motivation is mixed and the benefits to the community are real, then several theories assign moral credit to corporate giving, including utilitarianism, different versions of theories that say that businesses are parties to a social contract, and Aristotelianism. Even a Kantian theory can assign considerable positive value to company philanthropy with a mixed motivation, so long as it is the right sort of mix. The action that is in accordance with duty but motivated by extra-moral forces can still be honourable, beautiful, and so on according to Kant.

What are the appropriate forms of corporate philanthropy or ‘social responsibility’? The question has an edge in places where the private sector is increasingly expected by government to pay directly for, or sponsor programmes in, schools and hospitals, and when businesses are partners with the state in big transportation and housing projects. Does a firm go beyond what can reasonably be demanded of it when it takes over responsibility in one place for a service or institution that the state is responsible for elsewhere? Should it help only with public services or institutions, refraining from taking a leading role? And if it gives help, should the help have some relation to its business activity? Should a construction firm donate construction advice or labour for a public housing scheme; or should it lend the scheme one of its accountants? Should a supermarket take charge of recycling packaging on the goods it sells rather than lending its property-buying expertise to the public sector? Here a version of social contract theory, according to which business has an obligation to fulfil the expectations it creates in society, provides a clue to the answer. The closer a firm’s philanthropy to its public business activity, the less the risk of creating new, perhaps over-demanding, expectations among the public and confusion among internal stakeholders.

Many questions about the obligations of businesses to the wider world are less tractable than those we have been pursuing. For example, what are the obligations of transnational firms in societies with very different levels of prosperity? In what special circumstances are the assets of firms open to expropriation in the name of the public interest? To what extent is the law rather than corporate policy the best medium for stipulating the limits of corporate obligation?

4 Conflicts between obligations to stakeholders

Fulfilling obligations to one set of stakeholders can involve a firm in conflicts with another set. A policy of reducing costs may be pursued to maximize returns to shareholders, and yet it may involve the dismissal of productive and loyal employees. Recalling faulty goods for the sake of consumer safety may similarly conflict with the duty to maximize returns. Keeping suppliers waiting for their money may be justified by a duty to manage the liquid assets of a firm as profitably as possible, but it may drive the supplier into bankruptcy; and so on. The existence of these conflicts does not show, as might be thought, that it is unprofitable to gear obligations in business ethics to stakeholders. But it does raise the question of whether there is a pecking order among stakeholders, so that obligations to one group typically outweigh obligations to another. The literature sometimes suggests that one or another group of internal stakeholders is pre-eminent: sometimes it is employees and sometimes it is shareholders. Neither group is uncontroversially the pre-eminent one, and much depends on facts about the firm with the conflicting obligations. It may be that for some firms at some times meeting obligations to employees makes the difference between staying in business and bankruptcy; for other firms it may be shareholders. Either way, considerations about the requirements of staying in business at a given time seem relevant to the pecking order; and when the survival of the business is not in question, it may be considerations about which group is the more important to the growth of the business.

5 Further questions

Not all questions in business ethics can be resolved into questions of what a business owes to its stakeholders. Questions can be asked about the morality of the market economy or of pursuing profit in general (see Market, ethics of the). Capitalism as an economic system, or democratic capitalism as a politico-economic system, can be subjected to moral appraisal. Occasionally the large question of the morality of capitalism is pursued in the literature without an enthusiastic audience among business people. Yet the relevance of the question has increased with the collapse of the command economy and the communist state. A market economy may be a condition for membership in the community of nations for countries once within the orbit of the Soviet Union, just as it has become the unquestioned condition for aid to the developing countries of Africa and Asia. On the other hand, it

may be that a bias in some places towards a ‘social market’ and in others towards a purer form of the market will simulate the old rivalry between capitalism and socialism.

The collapse of the Soviet bloc has put one sort of gloss on the question of the desirability of capitalism; the Green movement is responsible for another (see Green political philosophy; Environmental ethics). An economic system predicated on the possibility of indefinite growth, and the satisfaction, no questions asked, of a very wide variety of consumer demands, seems to many to be immoral in its profligacy and its relentless draining of natural resources. The Green complaint against capitalism goes far deeper than a protest against pollution and the loss of wilderness. It is a protest against the picture of technological and economic progress that both market and command economies have in common. More generally, it is a protest against the idea that nature is an economic resource, and that the human ability to produce by transforming nature is a good thing. Perhaps more fundamentally still, it is a protest against the identification of the good with the satisfaction of human desire. Business ethics has yet to confront these protests.

Butler, Joseph (1692-1752)

Joseph Butler the moral philosopher is in that long line of eighteenth-century thinkers who sought to answer Thomas Hobbes on human nature and moral motivation. Following the Third Earl of Shaftesbury, he rejects any purely egoistic conception of these. Instead, he analyses human nature into parts, of which he notices in detail appetites, affections, and passions on the one hand and the principles of self-love, benevolence and conscience on the other. His ethics consists in the main in showing the relation of these parts to each other. They form a hierarchy, ordered in terms of their natural authority, and while such authority can be usurped, as when the particular passions overwhelm self-love and conscience, the system that they constitute, or human nature, is rightly proportioned when each part occupies its rightful place in the ordered hierarchy. Virtue consists in acting in accordance with that ordered, rightly proportioned nature.

As a philosopher of religion, Butler addresses himself critically to the eighteenth-century flowering of deism in Britain. On the whole, the deists allowed that God the Creator existed but rejected the doctrines of natural and, especially, revealed religion. Butler's central tactic against them is to argue, first, that the central theses associated with natural religion, such as a future life, are probable; and second, that the central theses associated with revealed religion, such as miracles, are as probable as those of natural religion. Much turns, therefore, on the success of Butler's case in appealing to what is present in this world as evidence for a future life.

1 Life

For more than a century following the death of Thomas Hobbes in 1679, philosophers, theologians, and thinking men generally felt obliged to address his alleged reduction of morality to self-interest and his alleged banishment of God from the universe. Both views represent misreadings of Hobbes, but both quickly settled into received interpretations of him. The first view provoked an outpouring of moral philosophy that today, still, we associate with the work of the Cambridge Platonists, the Third Earl of Shaftesbury, Bernard Mandeville, Francis Hutcheson and, eventually, David Hume and Adam Smith. The second became allied with the claims of the British deists and so with the writings of men such as Herbert of Cherbury, John Toland, Anthony Collins, Matthew Tindal, Thomas Chubb, and, later, Hume, Edward Gibbon and Thomas Paine. The two views were connected, since religious scepticism was widely thought to be destructive of morality.

No figure is more central to these intellectual currents of the period than Joseph Butler. With *The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature* (1736), he dealt Deism a serious blow. Though one of the chief monuments of English philosophical theology, the *Analogy* was a topical work, directed against Tindal and the deists, and today, since the disputes to which it is a response have died out, it is little read. With Butler's other major work, matters are quite different. His *Fifteen Sermons Preached at the Rolls Chapel* (1726) is one of the enduring classics of British moral philosophy, and parts of it, such as the refutation of psychological egoism, are widely celebrated. To the *Analogy*, Butler appended two indices - one on ethics, the other on personal identity, which mounts a lasting criticism of John Locke on the subject.

Butler was born in May 1692, in Wantage, Berkshire. The son of a dissenter, he was sent to Samuel Jones' academy in Tewkesbury, from where he corresponded with Samuel Clarke about several matters arising out of Clarke's Boyle Lectures (1704-5) on the being and attributes of God (see Clarke, S.). (Today, this exchange is little read.) Butler impressed Clarke and subsequently enjoyed his support. At Tewkesbury, Butler converted to the established Church and so was able to enter Oriel College, Oxford, in 1714, where he again made important and powerful friends. Upon his taking his degree in 1718, Butler's supporters secured his appointment as Preacher at the Rolls Chapel in London, and his rise in the Church began. In time, he would become Bishop of Bristol, Dean of St. Paul's, and Bishop of Durham. That he enjoyed royal favour was obvious from his appointment as Clerk of the Closet, first to Queen Caroline in 1736, then to George II himself in 1747. Shortly after his assumption of the See of Durham in 1750, Butler fell ill and eventually took himself away to Bristol and then Bath, where he died in June 1752.

2 Moral philosophy

In the *Sermons* (preface: 8), Butler's aim is to explain 'what is meant by the nature of man, when it is said that

virtue consists in following, and vice in deviating from it' and to show that this claim about virtue or morality 'is true' (1765: 8). Everything turns, therefore, upon what this nature is taken to be. Over this matter, however, commentators do not agree.

According to Butler, human nature is a system of parts - these are the particular passions, benevolence, self-love and conscience - and of the relations of these parts. In this last regard, Butler makes several points. Some parts of human nature are superior to others in terms of natural authority, which in turn orders the system; natural authority is to be distinguished from actual strength; and all cases of the usurpation of authority by strength are violations of human nature. The usual interpretation of Butler can now be stated. Virtue consists in acting in accordance with the nature of man, when the parts of that nature and system are in right proportion. These parts are in right proportion when our inward principles (whereby he means general principles of action or motives) exhibit their ordered authority, and these principles exhibit their ordered authority when the particular passions are controlled and regulated by benevolence and self-love and when conscience or the principle of reflection controls and regulates benevolence and self-love, as well as the particular passions, and so reigns supreme over the system. Human nature is thus a three-level affair: the particular passions; the principles of benevolence and self-love; and conscience.

A more radical interpretation is possible. This takes seriously passages in which Butler marks off the authority of self-love from that of benevolence, as when he remarks that 'reasonable self-love and conscience are the chief or superior principles in the nature of man' (*Sermons*, III: 13) as well as the fact that his examples of benevolence almost invariably involve particular passions. It also takes seriously Butler's claim about self-love and conscience that 'an action may be suitable to this nature, though all other principles are violated; but becomes unsuitable if either of those are'(*Sermons*, III: 13). Accordingly, human nature can appear to be a two-level affair, with the particular passions and benevolence on one level and self-love and conscience, now reigning jointly over the system, on another. Plainly, on this interpretation, the role of self-love in Butler's ethics is much more enhanced than on the usual interpretation.

When the inward principles in man exhibit their ordered authority, the system of human nature is in harmony, balance, and right proportion. Acts may be proportionate or disproportionate to man's nature; when they are proportionate, they are natural, when disproportionate, unnatural. An act is unnatural or disproportionate, not because it fails to be in accordance with the strongest principle in one at the time, but because it involves the usurpation of authority by strength. If hatred overwhelms self-love, then even though hatred is as much a part of our nature as self-love, the resultant action is unnatural. Thus, virtue consists in acting in accordance with the constitution of man, when the parts of this constitution are in right proportion; the act in question, natural and proportionate to human nature, is right. Vice consists in allowing a lower part of our constitution in terms of authority to predominate over a higher one and acting accordingly; the act, unnatural and disproportionate, is wrong. Thus, rightness and wrongness are matters of proportion, and the disproportion that a wrong or unnatural act involves is determined, not by its consequences, but by comparison of it with the nature of the agent, with, that is, whether it is suitable to the ordered system that is our nature. Thus, Butler is no consequentialist.

Particular passions. We have all manner of appetites, affections, and passions, from hunger, thirst, and bodily needs generally to compassion, love, and hate. Butler normally lumps all these together in order to contrast them with self-love and conscience, so that he usually writes as if the passions formed a single principle of action or motive. With regard to the particular passions, Butler emphasizes three points. First, we have all kinds of such passions or desires, and every one of them is 'a real part of our nature' (*Sermons*, III: 1). Second, some of our passions seem 'to respect self, or tend to private good'; others seem 'to respect others, or tend to public good' (*Sermons*, I: 6). That we have other-regarding passions, such as love, pity and compassion, Butler never doubts, and he castigates Hobbes for holding otherwise. These other-regarding passions are as much a part of our nature as our self-regarding ones. Third, our self-regarding and other-regarding passions are not to be identified with self-love and benevolence, respectively. For example, we cannot equate satisfied desire with self-love; for the gratification of a particular desire is often at the expense of self-interest.

Self-love. Self-love is a general desire for one's happiness, and it is 'inseparable' from any creature 'who can reflect upon themselves and their own interest or happiness, so as to have that interest an object to their minds' (*Sermons*, XI: 3). It is thus, unlike passion, a reflective or rational principle. As such, it provides us a measure of

control and regulation of the passions, in which task it is assisted by conscience, and it is a calculative principle, ranging over the likely consequences of acts to determine which are likely to be in our (long-term) interest. Butler's emphasis is always on restraining the passions, else they usurp the authority of self-love and conscience and so motivate us at the expense of our interest and judgment. Significantly, too, whereas the passions are occurrent - particular desires for this or that thing - self-love is an abiding, general desire for our own happiness.

Benevolence. If benevolence were a general principle of action on a par with self-love, we should expect Butler to maintain that it is an abiding desire for the happiness of others and so is an independent and reflective principle that aims at their happiness and restrains and regulates the passions. But he nowhere asserts that we have any such abiding desire, especially a general desire aimed at others indiscriminately or at humanity in general. His examples of benevolence are more limited - typically, confined to family and friends - and thus appear to be particular passions. He does insist that benevolence is not contrary to self-love, but this only makes the point, dubious if taken too far, that being benevolent can make us happy and serve private ends.

Happiness. Though self-love aims at happiness, it is not the same thing as happiness. Happiness consists in 'the enjoyment of those objects, which are by nature suited to our passions'; self-love simply 'helps us to gain or make use of' those objects (*Sermons*, XI: 6). We do not make things suitable to our passions; nature does this. We simply find that we take delight in certain things as a result of their engaging our passions, and self-love helps put us in the way of securing them. Without particular passions, then, happiness could not exist, since it 'consists in the gratification of particular passions' (*Sermons*, XI: 6). Thus, to aim at happiness makes no sense; one needs to aim at securing the objects of some of one's particular passions.

3 Moral philosophy (cont.)

Butler now adds an important point. Particular passions are particular desires for particular objects, and we individuate these desires by means of their objects. One is a desire for food, another for revenge, and what satisfies these desires is obtaining their particular objects. This feature of desires is quite independent of whether the desire, or its satisfaction, is to our interest or happiness. A desire for heroin is aimed at having the drug, and an injection of heroin satisfies this desire; this is true even if such a desire, or its satisfaction, is not to our interest.

Psychological egoism. The refutation of psychological egoism applies the content of the preceding discussion. For example, psychological hedonism is the view that each of us pursues exclusively our own pleasure. Were this view true, all of our desires would have the same object, pleasure, and this is plainly false. As a doctor who desires to cure my patient, I do not desire pleasure; I desire that my patient be made better. In other words, as a doctor, not all my particular desires have as their object some facet of myself; my desire for the well-being of my patient does not aim at alteration in myself but in another. My desire is *other*-regarding; its object is *external* to myself.

Of course, pleasure may arise from my satisfied desire in such cases, though equally it may not; but my desire is not aimed at my own pleasure. The same is true of happiness or interest: my satisfied desire may make me happy or further my interest, but these are not the objects of my desire. Here, Butler simply notices that desires have possessors - those whose desires they are - and if satisfied desires produce happiness, their possessors experience it. The object of a desire can thus be distinguished from the possessor of the desire: if, as a doctor, my desire is satisfied, I may be made happy as a result; but neither happiness nor any other state of myself is the object of my desire. That object is other-regarding, my patient's well-being. Without some more sophisticated account, psychological egoism is false.

Conscience. Conscience is a principle of reflection that judges acts right or wrong and characters and motives virtuous or vicious. It also, however, approves or disapproves of what it finds. Thus, in the dissertation *Of the Nature of Virtue*, an appendix to the *Analogy*, conscience is described both as a 'sentiment of the understanding' and 'a perception of the heart', and in the *Sermons*, Butler maintains that it is in virtue of conscience that man 'is a moral agent'. Thus, he gives every evidence of rejecting the view that morals are either a matter of reason or a matter of sentiment, an option upon which Hume was subsequently to insist.

As a reflective principle, conscience reflects in the case of acts upon whether they are natural and proportionate to our nature, and this brings in the authority of parts. To say of conscience that it possesses 'supreme' authority is to say that no act may violate or usurp it and remain proportionate to the system that is our nature. But this Butler says of self-love as well, and the implication seems to be that self-love and conscience are the 'chief or superior

principles' in man. Exactly in what the supremacy of principles consists is a matter of controversy, particularly as regards conscience; but naturalness and unnaturalness are crucial to its understanding.

The pronouncements by conscience of naturalness or unnaturalness are not calculative, for example, based on consequences, but immediate and, presumably, infallible. We have 'the rule of right within', and we have only to attend to it, to appreciate its authority, if not its strength, to see our way, morally (*Sermons*, III: 3). Much is unclear here, both because Butler does not give particular examples of how determinations of rightness are arrived at by appeals to naturalness and because the kind of intuitionism that seems implied by his remarks is simply assumed in its results to be uniform throughout all 'plain' and 'honest' men (*Sermons*, III: 4).

4 Moral philosophy (cont.)

If benevolence does not conflict with self-love, neither does conscience; indeed, conscience and self-love are 'perfectly coincident', if not here, then in the hereafter. They always, Butler says, 'lead us in the same way' (*Sermons*, III: 13). Apart from the invocation of God and the hereafter, there is no warrant for this claim in Butler's account of human nature, which poses a problem. If duty and interest pull us sometimes in different directions, and if we cannot violate either and remain true to our ordered nature, what do we do? A virtual guarantee of the coincidence of duty and interest seems required to avoid this impasse, and an appeal to the goodness of God is supposed to provide it.

Revelation. Curiously, this invocation of the goodness of God strikes an odd note. For Butler stresses that, exclusive of any belief in revealed religion, man is 'a law to himself' (*Sermons*, III: 3) and that one's obligation to obey this law flows from 'its being the law of your nature' (*Sermons*, III: 6). This obligation remains in force, even if 'the prospect of a future life were ever so uncertain'. But if we assume that a future life is uncertain, how can we use the hereafter to guarantee that we will not have to face a choice between duty and happiness? And if we do face that choice, Butler says that, when we 'sit down in a cool hour', we cannot justify the pursuit of virtue to ourselves 'till we are convinced that it will be for our happiness or at least not contrary to it' (*Sermons*, XI: 21). What if we are not convinced? Even treating the 'cool hour' passage as aberrant, the problem of a choice between duty and interest remains.

Strength and motivation. One of the most pronounced features of the *Sermons*, namely, Butler's repeated insistence that benevolence, conscience, and virtue are not opposed to self-love, can now be understood. Human nature may be hierarchical, based on the authority of parts, but the strength of self-love, prudence, and the self-regarding passions is great. Even if we have other-regarding passions and benevolent affections, will they be strong enough to motivate us at the expense of interest? If it could be shown that they were not at the expense of interest but actually served it, then one could hitch, for example, self-love to the cause of benevolence, and so perhaps increase the latter's chances of motivating us. Otherwise, we have to contend with the facts that (1) our other-regarding passions are rarely as strong as our self-regarding ones; (2) we have no general desire for the happiness of others; (3) our particular passions for the happiness of certain others typically do not carry us beyond the persons whose happiness is the object of those passions; and (4) prudence and self-love are powerful driving forces of our nature. What reason have we to think that we will choose benevolence over self-love?

Nor does conscience come off any better. For even if we allow it a motivational element and so regard it as more than judgment or reflection, that is, even if we allow that it can generate a desire in opposition to the desires in which the self-regarding particular passions, prudence, and self-love flow, Butler laments that its 'strength' and 'power' may be inappropriate to its authority. In fact, then, we may not be sufficiently motivated either to act benevolently or to pursue virtue. What Butler needs is a policy of insurance in these regards. That policy in both cases is to bring happiness and self-love to the rescue; hence, the repeated insistence that benevolence, conscience, and virtue are not 'contrary' to happiness or interest.

In the case of conscience and virtue, then, the motivational problem can be acute. Butler never says of actual individuals that they will come to love to be virtuous for its own sake; accordingly, it matters to his position that duty and interest or happiness coincide. But if they imperfectly coincide in this world, and if I am powerfully driven to seek my own happiness, then exactly how is the knowledge that God will rectify matters in the hereafter supposed to motivate me sufficiently powerfully to forego my happiness in this world? And even if we assume this knowledge about God gives rise to or is accompanied by a desire to forego my happiness in this world, why is this

desire assumed to be more powerful than my desire for my happiness, unless I do in fact love virtue for its own sake? An answer is required, if conscience is to be the 'guide' of our moral lives.

5 Philosophy of religion

By the time the *Analogy* was published, deism was rampant. It consisted not so much in a positive body of doctrine as in doubts about the Christian stories and the Church, and the sowing of such doubts, even when belief in God remained, was worrisome to the orthodox. For mere belief in God's existence, obviously, would not validate the specific claims of the Christian revelation. To validate these, Butler's effort is in two parts. First, he tries to show that, if the deists accept the existence of an intelligent Creator of the natural world, then when they examine God's handiwork, in order to find out what it contains and how it operates, they will find probable: (1) that there is a future life, in which 'our capacity of happiness and misery' persists; (2) that 'our happiness and misery Hereafter' depend 'upon our actions Here', in terms of God's rewards and punishments; and (3) that 'our present life is a state of probation for a future one', in that our present life exposes us to temptations that we must resist, if we have a concern for our future happiness. This material occupies Part I of the *Analogy*. Second, Butler turns in Part II to parts of the Christian revelation, and tries to show that when we look at what we find in this life, it is probable not only that there would be such a revelation, parts of which are 'imperfectly comprehended' by us and so about which we are doomed to 'ignorance', but also that many of the distinctive doctrines of Christianity, such as the coming of the Messiah and miracles by a divine personage, pass muster. His aim in this latter regard is to show that 'there is no presumption against a revelation as miraculous' and that 'the general scheme of Christianity, and the principal parts of it, are conformable to the experienced constitution of things, and the whole perfectly credible'.

While, doubtless, there are individuals who regard Part II of the *Analogy* as an integral part of their defence of Christianity, most modern readers will find Part I the more intriguing. It is there that Butler displays his argument form - analogical or inductive reasoning from what we find here in this life to what is probable in the life to come - and shows us what he is going to regard as evidence here for the probability of a claim about the hereafter. On both counts, the modern temper is likely to register deep scepticism, on the one hand about the usefulness of inductive reasoning from here to the hereafter, on the other about exactly what we will take as evidence for the probability of claims about the hereafter, for example, that God will reward and punish us for what we do here. Of course, to some extent, this scepticism and talk of evidence for claims about the hereafter get wrapped up in all the discussion since Hume's *Dialogues Concerning Natural Religion* (1779) about design and purpose in the natural world, and there is no doubt that, as far as the Christian revelation is concerned, Butler must achieve rather impressive feats with the evidence to make probable that God has 'by external revelation, given us an account of himself and his moral government over the world' (*Analogy*, II, vii: 31) (see Hume, D. §6). Then, too, general worries about induction and what it can establish are never far from the surface here, as Butler meticulously marshals his evidence in favour of the truth of natural and revealed religion.

Butler certainly believes that the evidence for natural and revealed religion is considerable and their probable truth high. But what if the deist does not go along with this, as, indeed, he might not, given that at the time what passed as evidence was being increasingly called into question? Every fresh attack on or alternative explanation of it lowered the probable truth of natural and revealed religion. Here, in a way, is the test Butler must meet. He tries to meet it with two claims. First, even if the probability of Christianity is low or slight, it does not follow that it is false. Second, even if its probability is low or slight, if we act, then we must act 'upon that presumption or low probability, though it be so low as to leave the mind in very great doubt which is the truth'. In life, probability must be our guide, and this is true even when the probability in question is slight. Put differently, if we have any regard for our own happiness, we must act on the basis of what is more probable, though this probability be extraordinarily small. This is true in the case of Christianity: if its truth be ever so slightly more probable than its falsity, then we should act upon it. In *A Charge to the Clergy of the Diocese of Durham* (1751), Butler turns this into something akin to Pascal's wager when he remarks of Christianity that, even if it were only slightly probable, 'it ought in all reason, considering its infinite importance, to have nearly the same influence upon practice, as if it were thoroughly believed' (see Pascal, B.). In the *Analogy*, Butler puts this point about conduct very emphatically: whether Christianity is true or may be true, whether it is certain or doubtful 'in the highest supposable degree', makes no practical difference. Doubting, he says, 'necessarily implies some degree of evidence for that, of which we doubt', and some, even slight evidence for Christianity 'does as really lay men under obligations, as a full

conviction that it is true'.

This argument for Christianity can appear a modest one, far removed from the ringing endorsements to which the orthodox were accustomed; in fact, this very modesty - few assumptions, few grand claims, no a priori reasoning, reliance upon evidence - would appear to be part of Butler's appeal. Yet, the argument itself seems to point the way to a beginning of criticism of it. If slight evidence in favour of Christianity should induce us (to believe it or) to act in accordance with it, should slight evidence against it induce us (to disbelieve it or) to act contrarily? If probability is the guide of life, what if there is slight probability against an afterlife, miracles, and so on? If Butler responds that there can never be such evidence or probability, this seems implausible; after all, Hume adduces at least *some* evidence for rejecting miracles. If Butler responds that such evidence or probability is never at a level to be compelling, then, even if this is true, why are his opponents forced to a level of compelling evidence, in order to have evidence enough to act upon? And if Butler responds that we have to weigh and balance the evidence in order to decide where the balance of evidence falls, then we need to be told what the principles are by which we weigh and balance. No such principles are set out, and weighing and balancing evidence is not a process on display in the *Analogy*. In short, at least one reading of Butler is that he holds that there is nothing in the natural world (and the claims of natural and revealed religion) that could give one even the slightest evidence against belief in an afterlife or miracles, so that such things can be held by him to be probable because those who oppose them are bereft, not of compelling evidence, but of evidence altogether. As it were, religion wins because there is in effect nothing to oppose it. The deists would not have accepted this, nor today, perhaps, would anyone not already religious, either in the natural or, more realistically, the revealed sense.

6 Personal identity

In the dissertation *Of Personal Identity* Butler turns to an issue of central importance to the *Analogy* - an afterlife, and whether we shall be the same person then as we are now. This leads him directly into a discussion of in what sameness of person consists, and on this score he makes (at least) four points, which in the main are with respect to Locke's discussion of personal identity in his *Essay Concerning Human Understanding* (1689).

First, 'upon comparing the consciousnesses of one's self, or one's own existence, in any two moments', there 'immediately arises to the mind the idea of personal identity'. Such a comparison shows that one is the same self from moment to moment.

Second, though this consciousness now of what is past shows our identity to ourselves, it does not constitute our identity. As Butler puts it, 'consciousness of personal identity presupposes, and therefore cannot constitute, personal identity; any more than knowledge, in any other case, can constitute truth, which it presupposes'. Trying to analyse personal identity in terms of memory, therefore, as Locke at one point is taken to have done, will not work; memory presupposes personal identity.

Third, in response to Locke's question of whether the same self is the same substance, a question that arises because consciousness of one's existence at two different times are two successive consciousnesses, Butler observes that such successive consciousnesses, while numerically different, are 'consciousnesses of one and the same thing or object; of the same person, self, or living agent'. Consciousness that one is the same person or self is consciousness that one is the same thing, which, if this thing is called substance, as in Locke, is consciousness that one is the same substance. Butler notices that Locke defines person as 'a thinking intelligent being' and personal identity as 'the sameness of rational being', and he maintains, accordingly, that the same rational being is the same substance, since being and substance here 'stand for the same idea'.

Fourth, we may distinguish between loose and strict senses of 'sameness'. In the loose sense, a tree remains the same over time even though it loses or gains parts or properties; indeed, over time, all of its parts or properties may change and it remain the same tree. In the strict sense, however, this is impossible; that is, it is a contradiction to say of the tree then and now that it is the same 'when no part of their substance, and no one of their properties is the same'. Sameness of persons refers to this second sense, so that sameness in this regard 'cannot subsist with diversity of substance'.

All four of these points have figured prominently in discussions of personal identity, and theorists even today often develop elaborate accounts of sameness of person either around or with them. *Of Personal Identity* remains very much alive (see Personal identity).

Byzantine philosophy

In Byzantium from the ninth century through to the fifteenth century, philosophy as a discipline remained the science of fundamental truths concerning human beings and the world. Philosophy, the 'wisdom from without', was invariably contrasted with the 'philosophy from within', namely theology. The view that philosophy is 'the handmaiden of theology', which the Greek Church Fathers derived from Philo and the Alexandrian school of theology, was not the dominant position in Byzantium as it was in the West; philosophy, and logic in particular, was never treated as a mere background to, or tool of, theology. By the same token, theology in Byzantium never developed into a systematic method of dialectical inquiry into Christian truths, or a science. Thus the initial distinction between philosophy and theology remained intact.

In terms of institutional practice, theological schools and studies did not exist in Byzantium and the main purpose of higher studies was to train state functionaries. This instruction, based on philosophy and the quadrivium, was mainly private, but it received support from the emperor and the church and we do hear of occasional interference by the secular or ecclesiastical authorities, perhaps because of professional or personal rivalries among the philosophy teachers. Furthermore, Byzantium had no independent universities or centers of study instituted by monastic orders as there were in the West, where social and political conditions were different.

Philosophy in Byzantium also steered clear of involvement in the theological controversies that arose from time to time. The prevalent model of the thinker in Byzantium was a sort of encyclopedic teacher of philosophy, an erudite scholar who kept in touch with the sciences of the quadrivium (arithmetic, geometry, astronomy and music) and other disciplines and set the philosophical tone of the scientific curricula. The development of philosophy in Byzantium was thus very different from that of Western scholasticism.

1 Historical outline

Although early Christian writers on the ascetic theory of life had adopted the term *philosophia*, the earliest manifestations of autonomous philosophical thought in Byzantium appeared in the ninth and tenth centuries with the 'Christian humanists' such as Photios, Patriarch of Constantinople, Arethas of Patras, Bishop of Caesarea, and Leo the Mathematician (or Philosopher). Photios elaborated the doctrine of the Trinity in the dispute over the procession of the Holy Spirit (the *filioque* dispute) using the armoury of Aristotle's theory of substances (the distinction between 'first substance' and 'second substance'). He was keenly interested in Aristotelian logic, rejecting Plato's self-existent 'ideas', and he collected works by many ancient writers. Arethas copied and commented on works by Plato and Aristotle and wrote critical notes on logic, ontology and psychology.

In the late eleventh and twelfth centuries, the growing study of philosophy reflects the great boost given to higher education and learning by the foundation in 1045 of the 'University' of Constantinople. Among the teachers known as *hypatoi tōn philosophōn* (first among philosophers) were Michael Psellos, undoubtedly the most important and most prolific of the Byzantine polymaths, Ioannes Italos, Theodoros of Smyrna, Eustratios of Nicaea and Michael of Ephesos. The last two are better known as commentators on Aristotle. The general outlook of the pre-eminent philosophers of this period, and the particular tendencies in their work, display the basic characteristics of Byzantine philosophy but with some distinctive features, such as an even stronger leaning towards the classical models of Greek philosophy and attempts to pursue a more autonomous line of inquiry into problems of knowledge, the natural world and human nature.

The temporary conquest of the Byzantine Empire by the Latin crusaders in 1204 shifted the centre of Byzantine intellectual life away from Constantinople. The flowering of literature and learning in at Nicaea, in Asia Minor, and the presence there of excellent teachers and writers of philosophy such as Nikephoros Blemmydes and Theodoros II Laskaris led to the emergence of generations of scholars well versed in philosophy and science. These men produced an impressive body of original work, especially in astronomy, during the politically troubled but culturally brilliant Paleologan period (1261-1453), the final two centuries of the Byzantine Empire. Outstanding among this group were Theodoros Metochites, Nikephoros Gregoras, Theodoros Choumnos, Georgios Pachymeres, Maximos Planoudes, Gennadios-Scholarios and Bessarion.

This splendid renaissance which coincided with the end of the empire also spread from the capital to other centres

such as Thessalonika and Mystras. Thessalonika was associated with the fourteenth-century Hesychast movement of Gregorios Palamas and his followers, a movement that had a considerable impact on Byzantine philosophy and also, more importantly, on the survival of Orthodoxy as a source and driving force of spirituality in the ensuing centuries of Turkish supremacy throughout the Balkans. Mystras, in the Peloponnese, was the home of the last great philosopher and perhaps the most original thinker of Byzantium, Georgios Gemistos-Plethon.

The awareness of Greek national identity had been cultivated, to a greater or lesser extent in earlier centuries but especially in the Palaeologan period, along with the development of Byzantine humanism. This movement had many features in common with the Italian humanism of the Renaissance. In particular, they shared a belief in the value and utility of the ancient Greek civilization with all its achievements, in the sciences no less than in other fields (see Humanism, Renaissance). There was a great surge of interest in the sciences, particularly mathematics and astronomy, and a number of major writers on these subjects emerged. Many works were also written on natural phenomena and cosmology.

2 The basic tenets of philosophical thought in Byzantium

The basic tenets that consistently characterized Byzantine philosophical thought throughout its history are first, the personal hypostasis of God as the principle not only of substance but also of being; second, the creation of the world by God and the temporal finitude of the universe; third, the continuous process of creation and the purpose behind it; and fourth, the character of the perceptible world as ‘the realization in time of that which is perceptible to the mind’, having its eternal hypostasis in the divine intellect (*nous*), the *Logos* (see Creation and conservation, religious doctrine of).

Phenomena, in Byzantine philosophy, are real hypostases to which the creator has given material existence by uniting them with the matter already created. Matter has no eternal existence: the ancient doctrine of uncreated, incorruptible matter is rejected utterly. Ideas have no self-existent hypostasis but are conceived by God and are instruments of God’s creative will and omnipotence. The general characteristics of sensible things (*universalia*) can be apprehended by the process of abstractive recognition; here the conceptual realism of the Alexandrian commentators on Aristotle is adopted and nominalism is rejected (see Aristotle Commentators; Nominalism).

Both the world and the human race are subject to divine providence, which is personal in character. Human self-determination does not conflict with the manifestation of divine providence, and Byzantine thinking on the subject presents a full affirmation of human free will. The soul as a spiritual substance, being by its very nature immortal, always belongs to one particular body. This personal soul is directly connected with the human being’s intellectual powers, which help him or her to achieve happiness by means of the freedom of decision. The relationship between God and human beings is based on love, which explains the central place of the human race in creation. Comparing Byzantine with ancient ontology, one can say in general that where the latter has ‘being’ the former has the doctrine of ‘existence’. The doctrines of the personal relationship between soul and body and the immortality of the personal soul are elaborated much more lucidly than in ancient philosophy (see Soul, nature and immortality of the).

3 General characteristics of Byzantine philosophy

The most important general characteristic of Byzantine philosophy, apparent in every period, is the absence of philosophical systems with real originality or independence. Instead, we find individual philosophers with an excellent classical education, extremely well versed in the writings of the ancient philosophers and with a discerning eye for subtleties of meaning. As far as Byzantine philosophers were concerned, the world view was fixed and crystalized and the study of philosophy was always regarded as a preparatory means to the ultimate end, which transcends the bounds of nature and cognition and consists in closer communion with God. Thus inquiry into such problems as the relation of faith to opinion and to knowledge - issues to which Christianity gave a new dimension with its concept of the individual - are the main areas in which philosophy is brought face to face with theology, and also Christianity with Hellenism.

On the one hand, therefore, Byzantine philosophers were quite familiar with the doctrines of the ancient Greek philosophers and had no difficulty in assimilating their ideas. It helped, of course, that they had a better knowledge of the language in which those texts were written than did those living outside the Greek-speaking world. A close

attunement to the Greek spirit led Byzantine philosophers to preserve the ancient philosophical texts, and to produce a fine set of commentaries on the most important of them (especially the Aristotelian and Neoplatonic writings) in the early post-classical period. In time this also generated an authentic (if unsystematic) philosophical tradition in the Byzantine world and produced some fine philosophers. Their main sources of inspiration were twofold: patristic theology (though with many of the ideas and methods of ancient Greek philosophy grafted on to it, after suitable modification) and first-hand study of Greek philosophical writings. The main purpose of studying these texts was to provide training in philosophical methods without regard to the 'rightness' or 'wrongness' of the views expressed in them, with the additional aim of resolving difficulties or rebutting theses that conflicted with the new (Christian) world view.

On the other hand, ancient Greek and Christian thought remained basically opposed to one another, despite the ever-increasing use of the ideas and methods of ancient philosophy which had helped to shape Christian doctrine in its final form. This antithesis was not all-embracing: some principles of pagan teaching in specific areas, chiefly ontology and cosmology, were rejected while others, especially in the realm of logical reasoning (for example, the apodictic syllogism, but not the dialectic method) and the natural sciences, were accepted. Moreover, the study of the ancient philosophers was not limited to commentary and interpretation but sometimes prompted critical discussion or even original elaboration of problems and the formulation of solutions. Thus for example, theological difficulties led to the clarification of philosophical concepts relating to the distinction between the essence (*ousia*) and activity (*energeia*) of God in the Hesychast controversy, where the debate was conducted using the armoury of classical metaphysics. The Byzantines always remained genuinely interested in grafting the teaching of the Scriptures and the Church Fathers onto ancient Greek wisdom, and in 'capturing concepts in Christ' and the eventual synthesis of 'philosophy' and 'knowledge of God'. This explains the ever-present influence of the great philosophers of antiquity throughout the Christian Middle Ages.

As regards the more specific and controversial question of the Byzantines' Platonism, Aristotelianism or Neoplatonism, the trends outlined above explain the frequent transformations undergone by many of the Platonic, Aristotelian and even Neoplatonic elements adopted by Byzantine thinkers, especially on such great issues as the concept of God, the relationship of the perceptible world to the absolute and the generation and essential nature of the soul. This has to be taken into account for an understanding of the so-called Platonism or Aristotelianism of the Byzantines and of their affinity with the thinking of the Neoplatonists. The affinity with any of these schools is largely external, inasmuch as the elements borrowed from them are chiefly methodological and logical, and the same language and terminology are used. This is particularly true of Neoplatonism, the phase of ancient Greek philosophy closest chronologically to the Byzantine period (see Neoplatonism). As regards the relationship of the most typical Byzantine philosophers with Plato and Aristotle, we find a balanced synthesis of logical and intuitive tendencies, with Aristotle on the side of logic and Plato on the side of intuition (see Aristotelianism, medieval; Platonism, medieval).

Leaving aside certain specific cases of accurate interpretation of the classical philosophers by Byzantine philosophers of the first rank, this attitude to both Plato and Aristotle gives Byzantine thought a typical manner of interpretation which leads away from the historical (that is, authentic) Plato and Aristotle. Furthermore, the preoccupation with the two great ancients ranges from pure study and interpretation for educational purposes to the fierce wrangling between rival schools that characterized the final centuries of the Byzantine Empire. In the former category we have the long line of Byzantine commentators on Aristotle, whose work established an authoritative and textually reliable Byzantine hermeneutic tradition which followed in the footsteps of the Alexandrian commentators, whose work they knew well and made good use of (see Aristotle Commentators). Thus they were instrumental in rehabilitating Aristotle's philosophy in the West after the Renaissance and ending the dominance of scholasticism and Averroism (see Averroism; Medieval philosophy; Renaissance philosophy).

The 'Platonism' of the Byzantines was the Platonic system which, having undergone many transformations, had been handed down to them from the Early Christian period and was often invoked for the defence of Orthodoxy against heresies. In the strife between the Hesychast movement of Gregorios Palamas and its opponents, many of the points at issue were Platonic concepts which had often exercised the minds of theologians and Christian philosophers in the past. In the fifteenth century, shortly before and immediately after the fall of Constantinople, individual interpretations of Plato and Aristotle led to the fierce philosophical dispute over the superiority of one or the other among the Greek scholars who had fled to Italy and were working as teachers or translators.

The interest taken in Neoplatonism by philosophers from Psellos to Plethon was manifested in a similar way, but it provoked a strong reaction, not only in terms of opposition to individual Neoplatonists such as Iamblichus and especially Proclus, but also in more general opposition on the part of the 'Aristotelians' to Orthodox theology and Western scholasticism in the dispute of the fourteenth and fifteenth centuries. The most obvious case in point is mystical theology, which is at once an ally and an adversary of Neoplatonism, especially in its attitudes to both Byzantine scholarship and Latin rationalism. During these two centuries mysticism was again the arena in which many philosophical concepts continued to exist not only externally but in personal practice. Here in mysticism, as also in Byzantine art, are to be found genuine metaphysical riches and experiential philosophical participation, which owes much to its contact with Neoplatonism. This explains the opposition of the church (or at least the official church) to this particular form of Byzantine spirituality, and it also accounts for Plethon's conflict with the church. Plethon had turned philosophy into a stirring experience and was fighting to resuscitate the Greeks' awareness of their national identity through philosophy.

The relationship between the Greek Orthodox East and the Catholic West (leaving aside the keen interest of both in Aristotle's philosophy) is of interest in connection with the conflict between the philosophical approaches of the two cultures. Despite attempts to improve mutual understanding in the Palaeologan period, when pro-Latin theologians and philosophers were active in the East, and despite the existence of numerous translations of Latin works (mostly by Thomas Aquinas) in the East, Byzantium remained closed to Western scholasticism right to the end. On the other hand, it is now known that Byzantium exerted a fertile influence on the West even before the forced migration of Greek scholars following the collapse of the Byzantine Empire in 1453 (see Aristotelianism, Renaissance; George of Trebizond; Platonism, Renaissance).

4 The study of Byzantine philosophy

Byzantine philosophy began attracting keen interest among scholars after the Second World War, long after most other periods and regions in the history of philosophy. A great deal of historical material is now available concerning the writings and teachings of major Byzantine philosophers and, more generally, concerning the cultivation of ideas and the trends of philosophical thought during those six hundred years.

Scholars now generally accept such fundamental premises as the unbroken continuity of Greek philosophy throughout the Greek-speaking world from classical times through late antiquity to Neoplatonism, recognizable in many tenets of the Church Fathers and in Christian Byzantium. In particular, the importance of linguistic continuity, which meant that ancient writings were widely used and understood in Byzantium, should not be underrated. Also, the accepted view of the relationship between theology and philosophy in Byzantium has been revised, with a more correct assessment of the dependence of Byzantine philosophy on patristic theology. Lastly, new facts have emerged and received opinions have been revised with regard to the relations and interaction between the Greek East and the Latin West in the realm of philosophy.

In conclusion, some methodological observations are called for concerning the background of Byzantine philosophy and the possibility of its systematic presentation. The philosophical output of this period, of which we have only fragmentary knowledge, is extremely varied and is spread over a wide variety of writings. Moreover, many important works are still unpublished or are available only in old and imperfect editions. Although many useful specialized books and papers have been written in recent years, the Byzantines' indebtedness to ancient philosophy has not been sufficiently studied or definitively assessed. Consequently any survey of the period could only be more or less schematic, though it can and must show the vigour and vitality of ancient Greek philosophy throughout the long era of Christian Byzantium.

Báñez, Domingo (1528-1604)

Domingo Báñez, once spiritual advisor to St Teresa of Avila, was a prominent Spanish theologian. In his commentaries on the Summa theologiae of Thomas Aquinas, he challenged an essentialist reading of Aquinas, and insisted that esse *(being) was an act. He is best known for his opposition to Molina's attempt to reconcile human free choice with divine foreknowledge, providence and grace. He also wrote on logic, and commented on Aristotle's On Generation and Corruption.*

Báñez studied at Salamanca, where he entered the Dominican Order in 1546. He held a series of teaching and administrative posts in Avila, Alcalá, Valladolid and Toro. In 1577 he returned to the University of Salamanca where he taught theology until he retired in 1600.

In logic, his *Summulae* (1599) stands out for its organization and its moderate use of nominalism (see Nominalism §1). Some of Báñez's points were original. For instance, in his section on signs, he rejected formal signs, reducing them to concepts and images, and taking away their character of mental language. As a result, he only accepted instrumental signs. He maintained the traditional division into natural and conventional signs, but explained that linguistic signs (especially onomatopoeia) were not so fully conventional that they had no relation with what is natural (see Language, Renaissance philosophy of §1). He restricted the scope of the section on consequences or inferences, and subordinated this material to syllogistic logic. His *Summulae* was very influential in Spain.

In metaphysics, he expounded an existential Thomism in his commentary on the first part of the *Summa theologiae* of Thomas Aquinas (§§6, 9). He argued that *esse* (being) cannot be seen as a categorial accident. Nor does it enter reductively into the categories, as Cajetan (§5) and Capreolus held, except in so far as what is participated in is that which realizes *esse*. Nor is *esse* an essence or something arising from essential principles. Rather, it is an act or actuality, and not just the last act, as Cajetan held, but both the first and the last. That is, *esse* not only completes a being, but makes it possible for there to be a being at all. All actuality comes from *esse*, for by it an essence is actualized. This is so in the ideal order as well as the real, for we can only think of something as existent, yet there is still no implication that being should be viewed as quiddity or essence. Being is limited by potentiality and essence, but it also gives content to things, not essential content, but that of existence or actuality. Although *esse* must suffer some imperfection in order to be received in created beings, it perfects essence without being perfected by it, and as a result *esse* is more perfect than essence (see Renaissance philosophy §4; Aristotelianism, Renaissance §2).

Báñez is best known for his work on human free choice. He replied to Luis de Molina's *Concordia* (first edition 1588) in a short work *De vera et legitima concordia liberi arbitrii (On the True and Legitimate Reconciliation of Free Choice)* (1600) (see Molina, L. de §2). Following Aquinas, Báñez argued that the primacy in any action belongs to God's efficacious grace, and that no reconciliation can remove this primacy. There is a physical premotion on God's part which does not affect human freedom, for God moves all things in this way, and humans are able to choose. Moreover, God sees humans as free without his omniscience being affected. In fact, Molina had sought to defend human freedom, but he thought it was enough that there should be a general or simultaneous concurrence of God, as primary cause, and human beings, as secondary causes, in the production of a determinate act. For Báñez this was not enough: a stronger concurrence, including physical premotion on the part of God, was also required. Molina also appealed to God's solicited grace which aided humans to do supernatural works without thereby necessitating their will, and to middle knowledge (*scientia media*) through which God knows what may be brought about with or without secondary causes. God can thus see future contingents (*futuribilia*) in his essence without having to establish predetermined decrees concerning them. Báñez, on the other hand, argued that God's grace must be efficacious, and he believed that God does not need any middle knowledge in order to preserve the purity of human free action. God sees everything at once, and so he sees what is determined as determined, and what is free as free. Báñez showed that Molina's doctrines could not be reconciled with those of Aquinas.

Cabanis, Pierre-Jean (1757-1808)

Cabanis believed in the possibility of a 'science of man', having its basis in medicine. He tried to show how a materialist conception of the human organism can throw light on our mental and moral life. The properties of living matter were derived from physical laws, but had their own peculiarities. In particular, the property of sensibility (being able to have sensations) and the property of motility (involving the experience of effort and of resistance to it) were the keys to understanding human nature.

Though the thrust of Cabanis' thought is materialistic, his emphasis on medical science distinguishes him both from the mechanistic tradition as represented by La Mettrie, and from the intellectualist tradition represented by Condillac, in which sensations are taken as given mental items, from which the rest of our mental life is constructed by operations of reasoning or association.

1 Life and works

Cabanis was born in Cosnac in the Limousin. He was registered as a medical doctor in Reims in 1784, after seven years' study in Paris (during which he had already become a protégé of Mme d'Helvétius, encountering Condillac, Condorcet, Benjamin Franklin, Mirabeau and Theodore Roosevelt in her circle). His radical ideas about the reform of medical practice and education would perhaps have made it difficult for him to be accepted by the medical establishment in Paris at the time. However, he did not make his profession as a doctor (though he treated Mirabeau, and published an account of Mirabeau's illness and death in 1791). Instead, he put his medical knowledge to political and philosophical use. In 1790, he wrote his *Observations sur les hôpitaux (Observations on Hospitals)* and this led to public office, including membership of the Commission on Hospitals, under the revolutionary régime. He also took an active interest in educational reform.

Like many members of the salon of Mme d'Helvétius at Auteuil, he withdrew from the public scene during the Reign of Terror, for fear of Robespierre. When he re-emerged, it was to stand for the ideals of reason, the perfectibility of the human species, and freedom. He was made Professor of Hygiene, and Professor of Clinical Medicine at the École de Médecine in Paris, and was elected to the Conseil des Cinq-Cents. On the creation of the Institut de France, he became a member of the short-lived 'Class of Moral and Political Sciences', where he delivered the series of memoirs which formed his major work, published in 1802: the *Rapports du physique et du moral de l'homme (Relations between the Physical and the Mental in Man)*. He became a senator in 1797, having supported Bonaparte's *coup d'état* of 18 Brumaire. However, he overtly opposed Bonaparte's growing authoritarianism. He belonged to a group of thinkers devoted to *idéologie* (the 'science of ideas'). The word was coined by Destutt de Tracy, a leader of that group, which included figures like Condorcet, Laplace and Lavoisier. But Napoleon soon adopted a repressive approach, and the appellation *idéologue* came to connote intellectual, social and political subversiveness. In about 1807, Cabanis seems to have composed a letter to Fauriel on first causes, in which he made concessions to the religious revival. The letter was published only in 1824, but we may surmise that Cabanis felt the need to seek some accommodation with the Imperial authority, as did other thinkers in the first decade of nineteenth-century Paris.

2 Thought

Cabanis was among those figures of the Enlightenment and post-Enlightenment period who believed passionately in the possibility and importance of a 'science of man'. The systematic understanding of brute matter which the mechanical philosophy had made possible should be matched in our understanding of the human species. This was not, of course, a new ideal, but what was distinctive in Cabanis' pursuit of it was his view that this understanding must be rooted in medical science, broadly conceived.

The memoirs which make up his *Relations between the Physical and the Mental in Man*, though materialist in cast, are concerned primarily with the special properties of living matter, especially in the human species. However, this was not necessarily a vitalist position. Indeed, Cabanis places his study of these properties in the context of a much more general principle, that of *attraction*, illustrated by gravity in physics, and by 'affinities' in chemistry and biology. Nevertheless, it is clear that he gives a certain autonomy to our understanding of living matter. Cabanis began this work by insisting that the moral and medical sciences must deal with human beings as whole creatures.

Like Descartes, he insisted on the union of mind and body, but unlike Descartes he was no dualist, adopting a broadly materialist approach, which gave a central role to sensation. The property of being able to have sensations, though peculiar to living matter, was derived from more general physical laws, and could give rise to unconscious as well as conscious psychological phenomena. The physiological underlayers of sensation could be seen at work in differences between the sexes, and other mental differences between people arising from their inherited physical constitution in interaction with environmental factors. Cabanis had no account of how life arose, and thought that we should not speculate about causes whose existence could not (as he thought) be experimentally verified, but he believed that one source of the development of life was the inheritance of acquired characteristics. This led him to argue for selective breeding of humans.

This summary of a diverse and wide-ranging set of memoirs is very incomplete, but it shows how Cabanis held a position which already had a substantial background, for instance, in the work of Boerhaave, Stahl, Bonnet, Haller, La Mettrie and others, authors whose importance he fully acknowledged. But these thinkers were divided. Could our understanding of living matter be a simple derivation from our understanding of matter in general? Or were there special types of explanation at play in the case of living matter? Some maintained that a single principle was at work in living matter, others, like Haller, made a radical distinction between a physical property of 'irritability' responsible for lower and unconscious functions not involving sensation, and a sensitive property which was responsible for sensation and other mental functions which were derived from it.

Cabanis, as we have already indicated, preferred a monistic position. Indeed, he was particularly known for his claim that just as the stomach digests food, so the brain is a device for digesting sense impressions: he said that it carried out 'the secretion of thought'. Some of his contemporaries, such as Maine de Biran, strongly rejected this claim. Nevertheless, Cabanis' systematic treatment of the physiological underlayer of our mental existence, with its exploration of internal factors such as sex, health, bodily chemistry, inherited dispositions, habituation, as well as external ones such as nutrition and climate, marked a distinct break with the intellectualist analyses of eighteenth-century sensualism, typified by Condillac. Like Bonnet, whom he admired, Cabanis could be seen as attempting to 'naturalize' sensualism. *Relations* is a wide-ranging work which also gives an important role to language, envisages 'transformism' (a precursor of evolutionary theory) and emphasizes the importance of motility: Cabanis claims that the consciousness of self requires the experience of effort, and of resistance to it (this view influenced Maine de Biran, who made it a main element in his own philosophy).

There is significant disagreement about how to read Cabanis' position. Some, including some modern commentators, have regarded him simply as a materialist. Others have viewed his work as endorsing some version of vitalism. The situation is further complicated by the posthumously published letter to Fauriel on first causes (*Lettre à Fauriel sur les causes premières*, 1824). Although called a 'letter', this is in fact a book-length opus. Some commentators have gone so far as to ignore it; others have viewed it as a recantation of Cabanis' former robust materialism; others again consider that it raises questions of method which were Cabanis' concern all along. On the latter interpretation, we should point out how, all along, Cabanis abjured the search for 'essences', 'occult powers' or 'first causes', a commonplace at the time. We should be empiricists, neither postulating nor speculating about the unobservable, but confining ourselves to what can be established by observation. The letter to Fauriel, however, distinguishes between what can be 'demonstrated' in this way, and what can be argued for only by calculating probabilities. The latter may, according to this 'letter', re-admit a religious world-view as something with a certain probability, even though it cannot be demonstrated by scientific methods. In the background were Châteaubriand's *Le Génie du Christianisme* (1802), and the influence of the Illuminati, and the many other factors which were bringing the end of the Enlightenment (see Illuminati).

Whether or not we regard this posthumously published 'letter' as a recantation, Cabanis' principal work had a substantial and fruitful impact on the early development of psychology and its connections with physiology, being reprinted several times up to the middle of the nineteenth century.

Cabral, Amílcar (1924-73)

Amílcar Cabral was founder and leader of the African Party for the Independence of Guinea and Cape Verde (PAIGC), which led a war of liberation in the Portuguese colonies of Guinea Bissau and Cape Verde that ended with the recognition of their joint independence by the Portuguese government in October 1974. Cabral was assassinated in 1973, the victim of an attempted coup aimed at taking over the PAIGC leadership. Thus he did not live to see the independence for which he had struggled. Cabral's importance for African political philosophy lies in his having developed an undogmatic left-wing analysis of the situation of the Guinean peasantry. While familiar with Marxist analysis, Cabral was always willing to adapt it to the empirical realities of the Guinean situation. His writings on the role of culture in the nationalist struggle, which have important affinities with Gramsci, combine theoretical ingenuity with detailed local knowledge.

1 Life

Amílcar Lopes Cabral was born on the Guinean mainland in Bafatá. Later he moved to the island of São Tiago in the Cape Verde islands. He began primary education only at the age of twelve, but by twenty he had completed in eight years an education that normally took eleven. During this period, Cabral participated in the literary current that grew up around the journal *Claridade* (1936-60). He wrote poetry that was nationalist but not explicitly anti-colonial, like much of the work of this group.

In 1945 he won a prestigious scholarship to the Higher Institute of Agronomy in Lisbon. He gained his degree in March 1952. While in Portugal he met other students from Portuguese Africa. He came to know a number of those who later became leaders in the independence struggles in Portugal's African colonies, among them Agostinho Neto, Angola's first president and Mario de Andrade, later head of the Popular Movement for the Liberation of Angola (MPLA); but unlike many of them, Cabral never joined the Portuguese Communist Party.

During this period Cabral was also engaged with what he called the 're-Africanization of the spirit'. He argued that this was a necessary step for 'assimilated' Africans like himself if they were to play a positive role in the nationalist struggle. Cabral's work at that time was strongly influenced by his reading of the *négritude* poets and of *Présence Africaine*, the major journal of that movement (see African philosophy, Francophone §4). Cabral returned to Guinea in 1952 to direct the research of a government experimental station near Bissau, the colony's capital. In 1953 he was asked by the authorities to conduct an agricultural survey of the colony. This experience played a crucial role in the development of his ideas. It provided him with first-hand knowledge of peasant life throughout the country and allowed him to 're-Africanize' himself by cultural immersion. In 1955 he returned to Portugal.

On returning to Guinea for a short visit in 1956 he helped found the African Party for the Independence of Guinea and Cape Verde (PAIGC). For the next four years Cabral worked as an agronomist in Portugal and Angola, where he was involved with the foundation of Angola's Marxist liberation movement (MPLA) through contacts from his student days.

In 1959 Cabral returned to Guinea to take part in a momentous meeting of the PAIGC at which some crucial decisions were taken. These included shifting the focus of the struggle from urban to rural areas, moving their political headquarters out of the country and promoting the idea of armed struggle against colonial rule. Moving their headquarters was possible because Guinée, the neighbouring French colony, had recently become independent. For the remainder of his life Cabral had a home in Guinée and the PAIGC conducted its programme of decolonization from a base there. From 1960 Cabral primary focus was on the political education of the party's core membership. Over the next decade the political mobilization of the Guinean peasantry played a central role in the work of the PAIGC.

From 1962 the PAIGC developed a guerrilla army trained to work with the peasantry. The group also built support from village chiefs and elders. Cabral was involved in the organization of both the war and the party's diplomacy as it sought to gain international support. He also organized the elections in 1972 which saw the creation of the National Assembly that declared independence eight months after his assassination in January 1973. The overthrow of the fascist regime in Portugal in the spring of 1974 led to Portugal's recognition of the independence

of Guinea and Cape Verde in October of that year.

2 Political theory

In ‘The Weapon of Theory’ (1966), probably his most widely-cited work, Cabral makes a number of quite specific criticisms and modifications of the Marxist tradition, as he understood it. For example, it cannot be the case that history begins only after the development of classes, as many European Marxists in the post-war period had argued. He claimed that there were no classes in the Marxist sense in much of Africa, Asia and Latin America before colonialism, or in early European history. His analysis of Guinean (and other) societies taught him there was not always class struggle throughout history, therefore, something else must have been the ‘motive force of history’ ([1966] 1980: 123) before the existence of class systems. This force is the mode of production, which means ‘the level of the productive forces and the system of ownership’ ([1966] 1980: 123). Class struggle did not exist in earlier forms of society in which there was a low level of development of the productive forces, such as technology and no private ownership of land. Cabral maintained that there was still historical development and offered an analysis of three stages of development of the mode of production, communal, agrarian and then socialist.

Within this analysis Cabral thought that European colonialism in Africa and elsewhere interfered with the historical development of African societies. He saw national liberation as ‘the regaining of the historical personality’ ([1966] 1980: 130) of a people. Foreign domination of the productive forces of an agrarian colony by a capitalist metropolis drives the history of a people according to a logic inappropriate to the level of productive forces in their society. Cabral went on to analyse the forms of stratification and the relations of production that imperialism imposed upon colonies.

Cabral’s political theory was developed in the context of his experience as a colonial subject and as the leader of a war of national liberation. Like all successful twentieth-century revolutionaries he succeeded in a context where there was almost no proletariat. He had to develop an account of his struggle which faced the reality that the PAIGC consisted of a petty-bourgeois leadership mobilizing a peasantry.

The key to national liberation, he thought, lay in the sphere of culture, but the role of culture depended on which class you were addressing. This was because of the ‘class-character’ of culture in the struggle for liberation. He resolutely opposed the notion implicit in *négritude* that the ‘re-Africanization of the spirit’, or ‘return to the source’ ([1966] 1980: 63) he had experienced as a member of the petty bourgeoisie was relevant to the situation of the rural peasantry. He felt this was because imperialism had had little effect on peasant culture. He also rejected *négritude*’s notion that there was a single African culture.

Cabral argued instead that it was necessary to nurture the popular culture of the indigenous peoples as the basis for a developing nationalist consciousness. With a critical approach to this aim a humanism that transcended nationality could be achieved. He also believed, perhaps because of his training in agronomy, that it was important to develop a scientific culture that would support the technology required for economic development.

The greatest challenge for national liberation was that the petty bourgeoisie would be tempted to become more bourgeois and ally itself with international capital. This is what happened to those societies that became neocolonial states after formal independence. (In Cabral’s view this would have included most of the states of Francophone Africa, except for Guinea.) The result was that the task of the revolutionary party was to shape the consciousness of the petty bourgeoisie before independence in such a way that they would become ‘capable of committing suicide as a class’ because they were ‘completely identified with the deepest aspirations of the people’ ([1966] 1980: 136). Cabral placed a great deal of emphasis on the cultural and ideological work of shaping the consciousness of the petty bourgeoisie, just as he had insisted on shaping the national consciousness of the peasantry. It is this aspect that bears a resemblance to Gramsci. This view is substantially at odds with much Marxist thinking which has denied the possibility that there can be a revolutionary petty bourgeoisie. Subsequent African history suggests that it is Cabral who is mistaken on this issue.

Cabral’s detailed analysis of the role of the popular culture of the peasantry as a basis for the development of national consciousness has had a great influence on cultural thought among intellectuals in Africa since the 1980s.

Cajetan (Thomas de Vio) (1468-1534)

Thomas de Vio, better known as Cajetan, has long been considered to be the outstanding commentator on the philosophical thought of Thomas Aquinas. He has had a great influence not only on discussions about Aquinas' theory of analogical predication regarding God and creatures but also on discussions about Aquinas' fundamental notions of essence and existence. On both counts his interpretations are at variance with Aquinas himself. He also set himself in opposition to Aquinas when he denied in his later writings that the immortality of the human soul could be demonstrated, arguing that it is a doctrine that must be accepted simply on faith, like the doctrines of the Trinity and the Incarnation. His explication of Aquinas' cognitive psychology is an interesting development that goes beyond Aquinas.

1 Life

Thomas de Vio was born at Gaeta. Entering the Dominican Order there in 1484, he first studied at Naples. In 1491 he was sent to Padua where he studied theology and metaphysics. Valentino da Camerino, a Dominican, had been appointed to the university's chair of Thomistic metaphysics in 1489. After Valentino was elected in 1494 to be provincial of the Roman province, he resigned his posts as professor of Thomistic metaphysics and as regent master in the Dominican *studium generale*. This was done before the 1494-5 academic year began. Despite his youth, Cajetan was called upon to fill Valentino's two posts temporarily. At the end of that academic year, he left Padua. Subsequently he taught theology at Pavia from 1497 to 1499. By 1501 he was in Rome as the procurator of the Dominican Order. He was named vicar general in 1507 and the following year he was elected master general - the head of the Dominican Order. In 1517 he was named a cardinal by Pope Leo X. The following year, while on a diplomatic mission for Leo in Germany, he had discussions with Martin Luther. He later wrote treatises defending the papal position. During the 1520s Cajetan turned his attention to biblical exegesis and he published commentaries on almost all the books of the Bible.

2 Logic and analogy

Although Cajetan wrote commentaries on Aristotle's *Categories* and *Posterior Analytics* and on Porphyry's *Isagōgē*, he is better known for his views on analogy, which supposedly explicate the position of Thomas Aquinas (§9). He begins his *De Nominum Analogia (The Analogy of Names)*, which was finished at Pavia in 1498, by lamenting that contemporary explanations of analogy are badly mistaken and lead astray those who study metaphysics. He is thereby attacking the views of fellow Dominicans, some of whom are his contemporaries. Cajetan takes 'analogy' to mean proportion or proportionality, and he claims to derive this account of the word from the Greeks, that is, from Aristotle (§7). According to Cajetan, there are three types of analogy to which all other analogies can be reduced. They are (1) the analogy of inequality, (2) the analogy of attribution or proportion, and (3) the analogy of proportionality. According to the first, the analogy of inequality, there is a common term or word for the analogous things and the notion connected to the common term is wholly the same. However, the analogous things share unequally in the nature involved, for example, 'body' as found in corruptible bodies on the surface of the earth and 'body' as found in the heavenly bodies, which Cajetan (following Aristotelian tradition) takes to be incorruptible. Since the notion of body is wholly the same, namely a substance subject to three dimensions, the logician considers the analogous things to be univocal. On the other hand, the philosopher studies the actual natures of the analogous things and therefore takes the analogous things to be equivocal (different in kind). The second type of analogy, analogy according to attribution, involves things of which there is a common name and also a notion that is the same. The distinguishing feature of this type of analogy is that there are different notions involved, according to the different relationships between the analogous things and that common name. An example is the term 'healthy', when it is applied to an animal, a medicine and urine. Only the first of the analogous things actually has the perfection, namely health as pertaining to the animal, whereas the perfection is said of medicine and other things by an extrinsic denomination, that is, by a term denoting an external relationship such as 'cause of' or 'sign of'.

Finally there is analogy of proportionality, which Cajetan considers to be analogy properly so-called. The name or term and the notion are the same only proportionally. What is involved in proportionality is a comparison of proportions; for example, eight is to four as six is to three. Cajetan explains that philosophers have extended the

term ‘proportionality’ to any similarity of proportions, so that one can say substance is to its existence as accident is to its existence. He believes that only this type of analogy enables us to know the intrinsic being, goodness and truth of things. Accordingly, he ranks analogy of proportionality above the other two types of analogy. Indeed, he judges that those who do not know and accept it are incapable of successfully studying metaphysics. Cajetan’s position in fact stands in opposition to that of Thomas Aquinas, who held to analogy of proportionality only in his *Quaestiones disputatae de veritate (Disputed Questions on Truth)*. Otherwise Aquinas only maintained the analogy of proportion based on attribution or reference to one First Being, namely God, and on all things other than God participating in an existence given them directly by God (see Language, Renaissance philosophy of).

3 Natural philosophy

In an early question entitled ‘Whether Mobile Being is the Subject in Natural Philosophy’, finished at Milan in 1499, Cajetan states that the limits of natural philosophy extend to and include the human soul, which is partly separated from and partly joined to matter. Neither the Intelligences that cause the motion of the heavenly bodies nor the angels are studied in natural philosophy. However, philosophers disagree as to whether their subject-matter is mobile being, mobile body, natural body or sensible substance. Cajetan takes the followers of Thomas Aquinas to hold that mobile being (which includes more than mobile body) is the true subject of natural philosophy. Accordingly, things are studied in natural philosophy from the formal aspect of their mobility (see Vernia, N. §3).

Another key topic treated by Cajetan concerns the principle of individuation, the basis for there being a multiplicity of material individuals in the same species or kind. In his early commentary *In De Ente et Essentia divi Thomae Aquinatis (Commentary on ‘Being and Essence’)*, which was finished at Padua in 1495, Cajetan took prime matter and its capacity for a particular quantity - this quantity rather than that quantity - to be the principle of individuation. He calls it ‘designated matter’ (*materia signata*) and attributes the notion to Aquinas. He later rejected this position on the grounds that the individual unity of Socrates would then be based on something accidental to him, namely quantity. Cajetan thus holds in his *Commentaria in Summa Theologiae divi Thomae Aquinatis (Commentary on Aquinas’ Summa theologiae)* that prime matter, which is the root and cause of quantity, is prior to quantity, and of itself numerically distinct. Matter somehow pre-contains quantity.

4 Psychology

Cajetan’s position on the immortality of the human soul underwent an evolution. In a sermon on immortality preached before Pope Julius II in 1503, Cajetan gave three arguments for the immortality of the human soul: that the soul knows all bodies and stands above them in judgment; that the soul has a natural desire to live forever; and that human beings enjoy a freedom of action that radically distinguishes them from the animals and can be explained only by immortality. He again maintained that human immortality was demonstrable in his *Commentaria in Primam Partem Summae Theologiae (Commentary on the First Part of Aquinas’ Summa theologiae)*, finished in 1507. He accepts Aquinas’ argument that the soul must be immaterial and subsistent (that is, able to exist on its own), since it knows all material objects and therefore has an operation which it does not share with the body. He also accepts Aquinas’ idea that even though the intellect depends on the phantasm for the object of cognition it is independent of the body in its very act of cognition (see Aquinas, T. §10). Subsequently in his *Commentaria in De anima Aristotelis (Commentary on Aristotle’s On the Soul)*, finished in 1509, he points out that learned men have given opposing interpretations of Aristotle’s words. He himself takes Aristotle to deny human immortality, emphasizing that for Aristotle all human cognition requires the presence of a phantasm. On the other hand, he emphasizes that he rejects the false position that, according to the principles of philosophy, the possible intellect (as opposed to the agent intellect) is corruptible. Indeed, he offers arguments for immortality on his own account. Nonetheless Cajetan was attacked for his interpretation of Aristotle by such fellow Dominicans as his former teacher, Valentino da Camerino, as well as by Francesco Silvestri, Bartolomeo de Spina and Crisostomo Javelli.

Some years later Cajetan came to reject any rational demonstration of immortality. In his commentary on the Epistle to the Romans, finished at Gaeta in 1528, he lists immortality with the Trinity and the Incarnation as mysteries that he accepted on faith. And in his commentary on Ecclesiastes, finished at Rome in 1534, he takes Chapter 3 to place immortality in doubt, since humans and animals are made from dust and return to dust. He then states explicitly that no philosopher has ever demonstrated immortality, that there is no demonstrative argument for immortality, and that immortality is believed on faith or is accepted on the basis of arguments that are only

probable (see Soul, nature and immortality of the).

In *Commentaria in De anima Aristotelis*, Cajetan observes that the human soul is treated by the natural philosopher as if it is joined to the body, but by the metaphysician as if it can be considered in abstraction from the body. Of special interest is Cajetan's interpretation of Aquinas' cognitive psychology found in his *Commentaria in Summa Theologiae*. Following Aquinas, he states that knowledge is gained by way of assimilation through a similitude (*similitudo*) of the thing known, namely an intelligible species that precedes the act of cognition. He rejects a view that had been defended by Agostino Nifo (§3) and other contemporaries, namely that an intelligible species is unnecessary since the act of cognition itself serves as the similitude. Cajetan explains that the light of the agent intellect enables the nature or quiddity that is present in the phantasm to shine forth without there also shining forth the individuality (*singularitas*) of the thing. The intelligible species is thus jointly produced in the possible intellect by a phantasm so-illuminated and by the agent intellect. Considered formally (*formaliter*), the intelligible in act is the intelligible species. But considered objectively (*obiective*), that is, from the point of view of the object known, the intelligible in act is the quiddity that the light of the agent intellect causes to shine forth in the phantasm.

5 Metaphysics

Some of Cajetan's basic metaphysical ideas differ notably from those of Aquinas, his supposed master. In his early commentary on the *Sentences* of Peter Lombard (which was never published), Cajetan closely follows Johannes Capreolus, an earlier Thomist, when he speaks of essence and existence as really distinct. He adopts from Capreolus the terminology of 'the being of essence' (*esse essentiae*) and 'the being of actual existence' (*esse existentiae actualis*). The same dependence on Capreolus is found in Cajetan's *Commentary on 'Being and Essence'*, where he again characterizes the 'being of essence' and the 'being of actual existence' as really distinct. They are 'things' (*res*) from which each creature is composed. Cajetan makes the surprising and questionable claim that this is the position of Aquinas (§9). It should be noted that in fact while Aquinas maintains as a basic doctrine that being (*esse*) is the first actuality of all and the source of all other actualities in an individual thing, Cajetan holds that being is the last or ultimate actuality (*ultima actualitas*) in an individual thing. Indeed, it is added to essence, which appears to possess in some way a being of its own for Cajetan.

List of works

Cajetan [Vio, T. de] (1495) *In De Ente et Essentia divi Thomae Aquinatis*, ed. M.-H. Laurent, Turin: Marietti, 1934; trans. L.H. Kendzierski and F.C. Wade, *Cajetan: Commentary on 'Being and Essence'*, Mediaeval Philosophical Texts in Translation 14, Milwaukee, WI: Marquette University Press, 1964.(*In De Ente* was finished at Padua in 1495 and first published at Venice in 1496. While commenting on Aquinas' text, Cajetan develops metaphysical ideas of his own.)

Cajetan [Vio, T. de] (1496) *Aristotle: On Interpretation. Commentary by Saint Thomas and Cajetan (Peri Hermeneias)*, trans. J.T. Oesterle, Mediaeval Philosophical Texts in Translation 11, Milwaukee, WI: Marquette University Press, 1962.(Cajetan here completes Aquinas' commentary on the *De interpretatione*, which stopped after Book II, Lesson 2. The text of Cajetan's addition to the commentary was first published at Venice in 1496 in Aquinas' *Expositio in Libros Posteriorum et in De Interpretatione*.)

Cajetan [Vio, T. de] (1496) *In libros Posteriorum analyticorum Aristotelis additamenta (Additions on Aristotle's Posterior Analytics)*, Venice: Simon de Luere, 1505.(This is Cajetan's own commentary on the *Posterior Analytics*, completed at Brescia in 1496.)

Cajetan [Vio, T. de] (1497) *Commentaria in Porphyrii Isagogen ad Praedicamenta Aristotelis (Commentary on Porphyry's Isagōgē regarding Aristotle's Praedicamenta)*, ed. I.M. Marega, Rome: Angelicum, 1934. (Completed around 1497; first published in 1505. Contains references to Albert the Great, Aquinas and Averroes.)

Cajetan [Vio, T. de] (1498) *Scripta philosophica: Commentaria in Praedicamenta Aristotelis (Commentary on Aristotle's Praedicamenta)*, ed. M.-H. Laurent, Rome: Angelicum, 1934.(Completed at Pavia in 1498 and first published at Venice in 1505. Cajetan thought that this work should hold first place among Aristotle's logical writings and therefore be studied even before Porphyry's *Isagōgē*.)

Cajetan [Vio, T. de] (1498) *De Nominum Analogia*, in P.H. Hering (ed.) *Scripta philosophica: De nominum*

analogia. De conceptu entis, Rome: Angelicum, 1952; trans. A. Bushinski and H.J. Koren, *The Analogy of Names and the Concept of Being*, Pittsburgh, PA: Duquesne University Press, 1953.(The *De Nominum Analogia* was completed in Pavia in 1498 and published at Venice in 1506. In it Cajetan presents his views on predications about God.)

Cajetan [Vio, T. de] (1499) *Quaestio de subiecto naturalis philosophiae (Question on the Subject of Natural Philosophy)*, in *Opuscula omnia*, Lyons: Juntas, 1587; repr. Hildesheim: Olms, 1995, 207-11.(Finished at Milan in 1499; first published at Venice in 1506. Cajetan defends as the position of Thomas Aquinas and his followers, the Thomists, that mobile being is the subject of natural philosophy.)

Cajetan [Vio, T. de] (1499) *Quaestio de infinitate Dei (Question on the Infinity of God)*, in *Opuscula omnia*, Lyons: Juntas, 1587; repr. Hildesheim: Olms, 1995, 192-206.(Finished at Pavia in 1499 and first published at Venice in 1506. Drawing on Aquinas, Cajetan argues that God's creative power is intensively infinite since it requires no passive potency on which to operate.)

Cajetan [Vio, T. de] (1503) *Oratio habita coram Julio secundo pontifice de immortalitate animorum (Oration before Pope Julius II on the Immortality of Souls)*, in *Opuscula omnia*, Lyons: Juntas, 1587; repr. Hildesheim: Olms, 1995, 186-8; trans. J.K. Sheridan, *On the Immortality of Minds*, in L.A. Kennedy (ed.) *Renaissance Philosophy: New Translations*, The Hague: Mouton, 1973, 46-54.(In this sermon delivered in 1503, Cajetan maintains that immortality can be proven and offers various arguments for it.)

Cajetan [Vio, T. de] (1507) *Commentaria in Primam Partem Summae Theologiae (Commentary on the First Part of Summa theologiae)*, in T. Aquinas, *Opera omnia*, vol. 5, Rome: Typographia Polyglotta, 1889.(This commentary was finished at Rome in 1507 and first published in 1508.)

Cajetan [Vio, T. de] (1509) *Commentaria in De anima Aristotelis (Commentary on Aristotle's On the Soul)*, ed. P.I. Coquelle, Rome: Angelicum, 1938-9, 2 vols; G. Picard and G. Pelland (eds) *Commentaria in libros Aristotelis De anima liber III*, Bruges: Desclée de Brouwer, 1965.(Cajetan's original *In De anima Aristotelis* was completed at Rome in February 1509 and published that same year at Florence; the first two books of the commentary appear in Coquelle, the third in Picard and Pelland.)

Cajetan [Vio, T. de] (1509) *De conceptu entis (On the Concept of Being)*, in P.H. Hering (ed.) *Scripta philosophica: De nominum analogia. De conceptu entis*, Rome: Angelicum, 1952, 97-102; trans. A. Bushinski and H.J. Koren, *The Analogy of Names and the Concept of Being*, Pittsburgh, PA: Duquesne University Press, 1953, 79-83.(Finished at Rome in 1509 and published in 1511.)

Cajetan [Vio, T. de] (1978) *Cajetan Responds: A Reader in Reformation Controversy*, trans. J. Wicks, Washington, DC: The Catholic University of America Press.(Translation of various short works written against the Lutherans: introductory essays on Cajetan's biography and on Cajetan and the Reformation.)

Calcidius (*c.* 4th century AD)

*The Platonist Calcidius (sometimes less correctly spelt Chalcidius) was the author of a Latin work containing a partial translation of, and partial commentary on, Plato's Timaeus. Although of uncertain date, the doctrinal content of his commentary reflects the thought of the Middle Platonist era (*c.*50 BC-AD 200).*

Calcidius' date and place of operation are uncertain, the only clue residing in his dedication of his work to one Osius, who has been taken, following identifications in a number of manuscripts, to be the Bishop of Corduba (AD 256-357) and spiritual advisor of Constantine. This identification has been challenged, mainly on the grounds that Isidore of Seville makes no mention of Calcidius in his enumeration of all the Spanish writers that he knows, but this is not conclusive. It is also true that his language is more consistent with a fifth-century than a fourth-century date, but even this is not conclusive when weighed against considerations of content. The main issue is whether Calcidius is to be regarded as exclusively dependent on Middle Platonist sources or as influenced also by the *Timaeus* commentary of Porphyry. In fact, there are sufficient indications that, unless Calcidius was being very selective (which does not seem to be his method), he knows nothing of Porphyry. His work seems primarily to be a translation of a number of Middle Platonist or Peripatetic Greek sources (or even of a single such source). Identifiable sources include the second century Peripatetic Adrastus of Aphrodisias, who wrote a commentary on the *Timaeus* concentrating on the mathematical and 'scientific' aspects, and the Neo-Pythagorean Numenius.

What we have is a translation of the dialogue as far as 53c, followed by a detailed commentary, beginning with *Timaeus* 31c (Calcidius ignores the introductory portion) and breaking off also at 53c (although a translation of, and commentary on, the whole seems to have been envisaged). It is hardly suitable in the case of Calcidius to speak of a distinct philosophical stance, since it is doubtful that he is putting much of himself into the commentary, but he reflects various interesting Middle Platonic positions. In chapter 176, for example, he presents a sequence of supreme god, intellect and world-soul which accords well with the systems of Numenius and Alcinous. The supreme god is identified with the Good of Plato's *Republic*, but there is no need to take it as a Neoplatonic One. At the other end of the scale, his doctrine that matter is neither corporeal nor incorporeal, but potentially both (chaps 319-20), agrees with that of Alcinous, Apuleius and Hippolytus.

Callicles (late 5th century BC)

*Callicles, although known only as a character in Plato's Gorgias (the dramatic date of which is somewhere between 430 and 405 BC), was probably an actual historical person. Employing a distinction between nature (*physis*) and convention (*nomos*), he argues eloquently that the naturally superior should seize both political power and a greater share of material goods: it is only a convention of the weak majority which labels such behaviour unjust. In private life the superior should indulge their desires freely: excess and licence are true virtue and happiness.*

Callicles is a wealthy and aristocratic young Athenian with ambitions to be a democratic leader, and the detail that Plato bestows on his portrait strongly suggests that he did in fact exist. Plato may have deliberately selected someone whose youthful promise was known to have come to nothing, as a warning against moral and intellectual indiscipline (there is a hint that Callicles was later arrested). Despite his proclaimed contempt for Sophists, his views appear indebted to those of Gorgias and may consequently be distorted by Plato's anti-Sophistic bias (see Plato; Sophists).

Callicles attacks Socrates' claim that doing wrong is more shameful than being wronged (see Socrates §4). This, he argues, is simply the conventional notion of justice, which is nothing but a craven invention of the weak majority to restrain the stronger few: the weak proclaim that equality of both power and wealth is 'just' because equality is the most they can expect. In nature, however, might is right, as is clear from both the animal kingdom and interstate relations. This is not simply brute fact, but a prescription: it is true justice, the 'law of nature'. It is thus naturally more shameful to suffer wrong than to do it, as the former shows that one is too weak to protect oneself and one's own. Natural justice decrees that those who are superior in courage, manliness and practical competence should appropriate both political control and the greater share of goods, and it is similarly a natural imperative that the superman should freely indulge his physical desires; the convention that praises self-restraint again results from a conspiracy of the weak majority who lack the natural force to satisfy their own urges. Breaking free from convention is the mark of nature's lions, and such 'real men' are in sharp contrast to the feeble, impractical philosopher.

By appealing to an alternative 'natural justice', Callicles is more radical than contemporary supporters of *physis* over *nomos*, such as Antiphon and Thrasymachus, who employ 'justice' solely in its conventional sense. He implies an antithesis between reason and desire, the latter being the true self. Any restraint on the desires, whether from society or from one's reason, is thus an unacceptable infringement of personal liberty. He is adamant that it is he, not Socrates, who truly understands human nature.

Callicles' defence of natural force is open to challenge, particularly for its appeal to the animal world. His notion of 'natural justice', being based on nothing more than description of the existing order, would be accused by some philosophers of committing the 'naturalistic fallacy' (see Naturalism in ethics §3). Furthermore, it is debatable whether his depiction of animal predators is correct. Do they really pursue individual interests to the total exclusion of group conventions? And if such apparent 'conventions' are simply a manifestation of their 'nature', does this not dissolve the antithesis on which Callicles relies?

It is also unclear whether human aggression is as natural as Callicles claims (he implies that everyone would imitate the superman if they could). Some would argue that, although we all possess egoistic drives, they only develop into ruthlessly competitive behaviour when encouraged by society. The only 'natural' aspect of the aggressive superman might be that it is natural to absorb social conventions, for good or ill. This, however, would only demonstrate again that Callicles' required antithesis between nature and culture is false.

Nor does he appear to have thought through what a society run by supermen would be like. How would they behave towards each other? Or would a single superman emerge from each community? And presumably the laws made by such supermen would have to command Callicles' respect. In disparaging man-made *nomoi*, he simply assumes a democratic framework. (The relation between Callicles' contemptuous dismissal of the majority and his democratic aspirations is an intriguing question in itself.)

Despite these and other inconsistencies and philosophic shortcomings, Callicles is an important figure. There is

evidence that he was a strong influence on Nietzsche and it is not difficult to see why. He challenges us to reconsider the origins and nature of social 'morality' and makes a vigorous bid for the possibility of self-directed virtues. He raises pertinent questions about the nature of 'manliness' and the relative merits of the active and the contemplative life. Above all, he forces us to reflect on the issues of personal identity and freedom, on which all his arguments depend.

Calvin, John (1509-64)

John Calvin, French Protestant reformer and theologian, was a minister among Reformed Christians in Geneva and Strasbourg. His Institutes of the Christian Religion (first edition 1536) - which follows the broad outline of the Apostles' Creed and is shaped by biblical and patristic thought - is the cornerstone of Reformed theology.

Calvin's religious epistemology links self-knowledge and knowledge of God. He identifies in humans an innate awareness of God, which is supported by the general revelation of God in creation and providence. Because sin has corrupted this innate awareness, Scripture - confirmed by the Holy Spirit - is needed for genuine knowledge of God. Scripture teaches that God created the world out of nothing and sustains every part of it. Humanity, which was created good and with free will, has defaced itself and lost significant freedom due to its fall into sin. Calvin sees Christ the mediator as the fulfilment of the Old Testament offices of prophet, priest and king.

Calvin insists that God justifies sinners on the basis of grace and not works, forgiving their sins and imputing Christ's righteousness to them. Such justification, received by faith, glorifies God and relieves believers' anxiety about their status before God. On the basis of his will alone, God predestines some individuals to eternal life and others to eternal damnation.

Calvin dignifies even ordinary occupations by seeing them as service to God. He recognizes the distinction between civil government and the Church, although he says that government should protect true worship of God and Christians should obey and support their government. Calvin's thought was dominant in non-Lutheran Protestant churches until the eighteenth century and has enjoyed a resurgence since the mid nineteenth century.

1 Life

John Calvin was born in Noyon, France. He spent five years studying Latin grammar and the arts at the University of Paris, where he became acquainted with both scholastic and humanist thought. After his father withdrew him from preparation for an ecclesiastical career, Calvin studied civil law at the University of Orléans and the University of Bourges. He received the licentiate in law in 1532 and, in the same year, published a commentary on the Stoic philosopher Seneca's *De clementia*, thereby establishing his credentials as a humanist familiar with ancient thought.

By 1534 Calvin publicly advocated ecclesiastical reform in France, which meant that he had broken with the papacy; he spent the rest of his life as a refugee. The first edition of the *Institutes of the Christian Religion*, written while he was in exile in Basle, was published in 1536. Several major revisions and expansions of the work appeared in both Latin and French, including the definitive Latin edition of 1559. Addressed to King Francis I of France, the preface to the *Institutes* argues that, since the reform movement is the legitimate heir to the Christianity of the Scriptures and the early Church and is not seditious, it should be protected from persecution.

In 1536, during a stop in Geneva on his way to Strasbourg, Calvin was persuaded to stay and assist the ecclesiastical reformers. Tensions between the reformers and the city council led to Calvin's expulsion from Geneva in 1538. After ministering in Strasbourg, he returned to Geneva in 1541 and remained there until his death. His pastoral work in Geneva and Strasbourg focused on ministry to French Protestant refugees.

Calvin has been criticized for his involvement in the death of the notorious heretic Michael Servetus in 1555. Having already escaped execution elsewhere for his heterodox Trinitarian views, Servetus appeared in Geneva, was arrested at Calvin's insistence, and was condemned to death by the city council. He was burned at the stake despite Calvin's request that he be beheaded instead.

In addition to the *Institutes*, Calvin wrote many polemical works as well as commentaries on most of the books of the Bible, and engaged in preaching and pastoral work. He founded the Genevan Academy in 1559.

2 Religious epistemology

'Nearly the whole of sacred doctrine consists in these two parts: knowledge of God and of ourselves.' In this opening line of the 1536 edition of the *Institutes* (and every edition thereafter), Calvin announces his fundamental project of describing how we acquire this twofold knowledge and summarizing its content. Self-knowledge and

knowledge of God are interrelated: self-knowledge leads us to be displeased with ourselves, thereby arousing us to seek God, the source of all good; and knowledge of God is required for a clear awareness of ourselves - especially of our folly and corruption.

Knowledge of God is not ‘empty’ or ‘cold’ speculation that ‘merely flits in the brain’, but rather knowledge that ‘takes root in the heart’ and includes the honouring of God (*Inst.*, 1.5.9; 1.12.1). Such reverence for and love of God, which Calvin calls ‘piety’, results from recognizing that we owe everything to God, are nourished by his fatherly care and should seek nothing beyond him.

Calvin insists that all humans have, by natural instinct, an awareness of divinity (*sensus divinitatis*). The universal need for religion - even idolatrous religion - shows that God has implanted in all people a seed of religion, a natural awareness ‘that there is a God and that he is their Maker’ (*Inst.*, 1.3.1). Religion was not ‘invented by the subtlety and craft of a few to hold the simple folk in thrall’ (*Inst.*, 1.3.2).

Lest anyone be excluded from access to happiness by lack of knowledge of God, says Calvin, God has also ‘engraved unmistakable marks of his glory’ upon the universe (*Inst.*, 1.5.1). The ‘skillful ordering of the universe is for us a sort of mirror’ reflecting the invisible God (*Inst.*, 1.5.1). And nursing infants ‘have tongues so eloquent to preach [God’s] glory that there is no need at all of other orators’ (*Inst.*, 1.5.3). Although we have within ourselves ‘a workshop graced with God’s unnumbered works’ that should lead us to break forth in praise of God, instead we are ‘puffed up and swollen with all the more pride’ because we see nature rather than God as the source of these good gifts (*Inst.*, 1.5.4).

God’s glory is also displayed outside the ordinary course of nature, in his declaring clemency to the godly and showing severity to the wicked, protecting the innocent, and caring for the poor in their desperate straits. Yet most people, ‘immersed in their own errors, are struck blind in such a dazzling theater’, and do not recognize the glory of God (*Inst.*, 1.5.8).

Although God represents himself in the mirror of his works with great clarity, we grow dull towards such clear testimonies and presumptuously fashion a deity of our own imagining. Our minds are like springs pouring forth gods we have invented for ourselves. Even philosophers adore a shameful diversity of gods (*Inst.*, 1.5.11-12).

Since there is no pure religion founded upon common understanding alone, we need the witness of God himself, ‘illumined by the inner revelation of God through faith’ (*Inst.*, 1.5.13, 14). ‘Just as old or bleary-eyed men and those with weak vision’ can scarcely see until they put on spectacles, ‘so Scripture, gathering up the otherwise confused knowledge of God in our minds, having dispersed our dullness, clearly shows us the true God’ (*Inst.*, 1.6.1). Calvin recognizes, however, that Scripture must be confirmed as the living word of God. Neither the consent of the Church nor disputation in defence of Scripture will imprint on people’s hearts the certainty and assurance that piety requires. The Spirit who spoke through the prophets must penetrate into our hearts to persuade us that they faithfully proclaimed what God spoke to them; the inner testimony of the Holy Spirit ‘is more excellent than all reason’ (*Inst.*, 1.7.4). In response to religious fanatics or enthusiasts who abandon Scripture and claim a new revelation from the Spirit, Calvin argues that God has forged a mutual bond between Word and Spirit, with the Spirit, as the author of Scripture, attesting the Word of God in Scripture and the Word leading us to recognize the true Spirit of God.

For Calvin, faith is ‘a firm and certain knowledge of God’s benevolence toward us, founded upon the truth of the freely given promise in Christ, both revealed to our minds and sealed upon our hearts through the Holy Spirit’ (*Inst.*, 3.2.7). Knowledge of the unseen God does not involve comprehension, as with objects of sense perception, but rather consists in assurance of God’s goodness towards us, which depends on our ‘truly feeling its sweetness and experiencing it in ourselves’ (*Inst.*, 3.2.15). Then, despite temptations and doubts, believers will ‘either rise up out of the very gulf of temptations, or stand fast upon their watch’, confident of God’s mercy to them (*Inst.*, 3.2.21, 37).

3 God, creation and providence

Calvin emphasizes God’s sovereignty and glory. He introduces the notion of accommodation in order to account for Scripture’s speaking of God’s mouth, ears, eyes, hands and feet (*Inst.*, 1.13.1); of God’s repenting of having created the world or of having made Saul king of Israel (*Inst.*, 1.17.12); and even of God’s wrath against sin (*Inst.*,

1.17.13; 2.16.2, 4). Such images 'do not so much express clearly what God is like as accommodate the knowledge of him to our slight capacity' (*Inst.*, 1.13.1).

Calvin affirms that God created the world by his own free will and follows Augustine in rejecting speculation about why God created the world when he did. He shows little interest in the duration or sequence of the events of creation, focusing instead on the spiritual value of observing that God created, out of nothing, an abundance and variety of creatures, each with its own nature and assigned functions, that God formed humanity as 'the most excellent example of his works', and that God has provided for the preservation of the entire creation (*Inst.*, 1.14.20). The goodness of creation should lead us to take 'pious delight in the works of God open and manifest in this most beautiful theater' (*Inst.*, 1.14.20).

Proper self-knowledge, says Calvin, is twofold: knowing what we were like when first created and knowing our condition after the Fall of Adam. As created, humans had rational minds to know their duty, and wills to direct the appetites under the guidance of reason. Only if humanity had not fallen would those philosophers be correct who hold that moral accountability depends on having free choice between good and evil. By sinning, Adam lost God's good gifts for himself and for his descendants, with the result that fallen human beings lack the ability to carry out their duty. Still, says Calvin, in being subject to the depravity and corruption of our nature, or original sin, we are not held liable for the transgression of another; the contagion imparted by Adam resides in us (see Sin §2).

Calvin insists that we see God's power as much in the continuing state of the universe as in its creation. God not only drives the 'celestial frame', but also 'sustains, nourishes, and cares for everything he has made, even to the least sparrow' (*Inst.*, 1.16.1). Since all events proceed from God's plan, 'nothing takes place by chance' - not even if a branch falls and kills a passing traveller (*Inst.*, 1.16.4, 6). Calvin argues that, unlike the Stoic dogma of fate, the doctrine of providence sees God as the ruler of all things who 'in accordance with his wisdom' has from eternity decreed what he was going to do and now carries it out (*Inst.*, 1.16.8).

If God wills all things, does he also will what is evil? Calvin argues that it is absurd to substitute 'bare permission' in the place of God's providence 'as if God sat in a watchtower awaiting chance events, and his judgments thus depended upon human will' (*Inst.*, 1.16.8; 1.18.1). Humans can accomplish nothing except by God's secret command. In response to the charge that God would then have two contrary wills - a revealed will that forbids sin and a secret will that decrees evil actions - Calvin says that God's will is one and simple in him but appears manifold to us because we cannot grasp how God both wills and does not will something to take place. Many Reformed theologians, while insisting with Calvin that all things are governed by God's providence, have departed from him by distinguishing between the active and the permissive will of God.

Calvin's affirmation of God's goodness in relation to evil events hinges on Augustine's insight that there is a great difference between what it is fitting for a human being to will and what is fitting for God. In opposition to those who 'wish nothing to be lawful for God beyond what their own reason prescribes for themselves', Calvin says that nothing but right flows from providence, although the reasons have been hidden from us (*Inst.*, 1.17.2). Conceding that his doctrine of providence might seem harsh, Calvin says we should not refuse to accept a teaching attested by clear Scriptural proofs just because it exceeds our understanding. In addition, believers can have gratitude for favourable outcomes, patience in adversity, and freedom from worry about the future because they know that all things are ruled by their heavenly father.

4 Christ and salvation

Even sinless humanity, says Calvin, would have needed a mediator in order to reach God. Yet the need for this mediator to be truly human as well as truly divine was due to our sin. The purpose of the incarnation was for Christ the mediator to become the redeemer, restoring the fallen world and assisting lost humanity in its distress.

Calvin's theology of the atonement emphasizes both Christ's victory over the powers of evil and his satisfaction of God's righteous judgment. Death held humanity captive, says Calvin, but Christ, in our stead, submitted to the power of death, grappled hand-to-hand with the armies of hell, and arose from the dead victorious over them. Alternatively, Calvin says that humanity's reconciliation with God requires the countering of disobedience with obedience, which Christ does in our place, paying what we could not pay and thereby acquiring righteousness for us (see Atonement §4).

Like Martin Luther, Calvin says that the doctrine of justification is the main hinge on which true religion turns. To be *justified* in God's sight means that one is counted righteous by God; to be justified *by faith* means that one who is in fact a sinner 'grasps the righteousness of Christ through faith, and clothed in it, appears in God's sight' not as sinful but as righteous (*Inst.*, 3.11.2). God justifies sinners by remitting their sins and imputing Christ's righteousness to them. God first freely embraces the sinner who is utterly void of good works and then conveys a sense of divine goodness that leads the sinner to despair of works and to rely wholly on God's mercy. So the faith through which sinners are justified is not itself a work that qualifies them for salvation, but rather God's gracious gift through which they receive God's mercy (see Justification, religious §4).

In his doctrine of predestination, Calvin attempts to avoid the twin dangers of either probing into matters that God wills to remain hidden or neglecting what Scripture says. Scripture presents two types of election: the general election of a nation or people, such as ancient Israel or the Church; and the election or predestination of individuals. Although God does not grant regeneration and perseverance to every member of an elect people, he works in the heart of each elect individual, granting perseverance so that this election is assured. Calvin observes that election involves the adoption 'in Christ into the eternal inheritance' of those who in themselves are unworthy of this adoption (*Inst.*, 3.22.1) (see Predestination; Providence §§3-4; Reprobation).

Predestination, then, is God's eternal decree regarding each individual, foreordaining eternal life for some and eternal damnation for others. This foreordination is not based on God's having foreseen the holiness of the elect or the sinfulness of the reprobate, but only in God's will, which to us is inscrutable. Mirroring election, reprobation is based in God's will, not in foreknowledge of the sinfulness of the reprobate. Calvin's doctrine of reprobation, which is rooted in his rejection of the idea of God's permissive will (see §3 above), differs from that of many Reformed theologians, who hold that God wills to elect some, thereby leaving the others in the ruin they incur by their sins.

5 Social and political thought

Calvin recognizes the dignity of each occupation - not just that of the clergy - as service to God. God has given each individual a calling or vocation 'as a sort of sentry post', to prevent heedless wandering about throughout life. Each person will fulfil his or her calling willingly, bearing its weariness and anxieties, if it is seen as a duty to God. 'No task', says Calvin, 'will be so sordid and base, provided you obey your calling in it, that it will not shine and be reckoned very precious in God's sight' (*Inst.*, 3.10.6).

Calvin argues that, since 'Christ's spiritual Kingdom and the civil jurisdiction are things completely distinct', legal or social distinctions of rank or privilege should not apply in Christ's realm (*Inst.*, 4.20.1). Nevertheless, civil government and the Church are to be mutually supportive. Accordingly, civil government should 'protect the outward worship of God' and even defend sound doctrine (*Inst.*, 4.20.2-3). Civil magistrates, who are given authority by God and serve as God's deputies, should embody divine providence, goodness, benevolence and justice. Governments may levy taxes, but should regard the revenues as treasuries of the people that must not be squandered.

Christians, for their part, must regard all magistrates as God's representatives, not as a necessary evil. Subjects should obey their government, pay taxes and accept service in public office or for military defence. Even wicked and unjust magistrates have been ordained by God and should be held by their subjects in the same esteem as they would hold the best of monarchs. Still, Calvin recognizes means for holding unjust rulers in check. Sometimes God raises up avengers to punish the wicked government, as when a just nation defeats a nation ruled by an evil leader; sometimes God appoints lesser magistrates to restrain unjust kings. Even common subjects must not allow their obedience to rulers to lead them to follow commands contrary to God's revealed will (*Inst.*, 4.20.32; *Comm.* on Daniel 6: 22) (see Religion and political philosophy).

6 Influence

Calvin's thought has had a wide influence in the Church, society and the academic world. His theology sparked movements for ecclesiastical reform that led to Reformed churches in continental Europe, Presbyterian churches in the United Kingdom, and Puritan groups that sought refuge in the American colonies. Owing to the effects of the Enlightenment and liberal Protestant thought, Calvinist theology declined in influence during the eighteenth and

nineteenth centuries. Since the middle of the nineteenth century, however, Calvin's thought has enjoyed a resurgence, having provided impetus to a Calvinist revival in the Netherlands led by Abraham Kuyper and to the neo-orthodoxy that flourished in the middle of the twentieth century under the leadership of Karl Barth and Emil Brunner. Calvin's religious epistemology has also influenced the development of 'Reformed epistemology' by Alvin Plantinga and Nicholas Wolterstorff (see Religion, history of philosophy of §8; Religion and epistemology).

Cambridge Platonism

Cambridge Platonism was an intellectual movement broadly inspired by the Platonic tradition, centred in Cambridge from the 1630s to the 1680s. Its hallmark was a devotion to reason in metaphysics, religion and ethics. The Cambridge Platonists made reason rather than tradition and inspiration their ultimate criterion of knowledge. Their central aim was to reconcile the realms of reason and faith, the new natural philosophy and Christian revelation. Although loyal to the methods and naturalism of the new sciences, they opposed its mechanical model of explanation because it seemed to leave no room for spirit, God and life.

In epistemology the Cambridge Platonists were critics of empiricism and stressed the role of reason in knowledge; they also criticized conventionalism and held that there are essential or natural distinctions between things. In metaphysics they attempted to establish the existence of spirit, God and life in a manner consistent with the naturalism and method of the new sciences. And in ethics the Cambridge Platonists defended moral realism and freedom of the will against the voluntarism and determinism of Hobbes and Calvin. Cambridge Platonism was profoundly influential in the seventeenth and eighteenth centuries. It was the inspiration behind latitudinarianism and ethical rationalism, and many of its ideas were developed by Samuel Clarke, Isaac Newton and the Third Earl of Shaftesbury.

1 Origins and context

The term ‘Cambridge Platonism’ has been used to refer to a group of thinkers active in Cambridge from the late 1630s to the 1680s, who were in one form or another inspired by the Platonic tradition of philosophy. Most of them were either fellows or students of two colleges, Emmanuel and Christ’s. Their inner circle consisted of Henry More (1614-87), Ralph Cudworth (1617-88), John Smith (1618-52) and Benjamin Whichcote (1609-83), who was its leading figure. Their outer circle of associates within Cambridge comprised John Sherman (d. 1666), John Worthington (1618-80), Peter Sterry (1613-72), George Rust (1626-70) and Nathaniel Culverwell (1618-51). There were also thinkers outside Cambridge who were closely connected with, and often shared the views of, the Cambridge Platonists: John Norris (1657-1711), Joseph Glanvill (1636-80) and Richard Burthogge (*c*.1638-*c*.1704). Among the disciples of the Cambridge school were some important latitudinarian divines: Simon Patrick (1626-1707), Edward Fowler (1632-1714), John Tillotson (1630-94), John Moore (1646-1714), Gilbert Burnet (1643-1715), Edward Stillingfleet (1635-99) and Thomas Tenison (1636-1715).

Cambridge Platonism represents the most concerted and systematic attempt in seventeenth-century English thought to reconcile the claims of reason and faith, philosophy and religion. Cudworth and More were the first thinkers in the English Protestant tradition to develop a sophisticated natural theology. Some of their most substantive works - More’s *Antidote to Atheism* (1653) and *Immortality of the Soul* (1659), Cudworth’s *A Treatise concerning Eternal and Immutable Morality* (1731) and *True Intellectual System of the Universe* (1678) - were devoted to precise and detailed demonstrations of the existence of God, providence and immortality. True to the tradition of Florentine Platonism (see Platonism, Renaissance §4), and contrary to Bacon and orthodox Protestantism, the Cambridge men sometimes completely identified the realms of reason and faith, as if nature and revelation were only different hypostases or degrees of manifestation of the divine goodness. They held that the truths of revelation are only a more spiritual form of reason, and the truths of reason only a more natural form of revelation. But they did not always adhere to this equation and sometimes abandoned it in the face of the more recalcitrant Christian mysteries, such as the Trinity and Incarnation, which were conceded to be above, although never contrary to, reason.

Cambridge Platonism began as a reaction to the more severe tenets of Calvinist theology, especially its doctrine of predestination. In their early years Whichcote, Cudworth and More were repelled by Calvin’s *deus absconditus*, which by some ‘dark and inscrutable decrees’ predestined people, regardless of their merits, to either salvation or damnation (see Calvin, J. §4). This undermined not only certainty regarding salvation, but also moral responsibility. The great attraction of Platonism was that it made the ways of God accountable to man, so that he could be sure of his eternal election. Platonism meant that there are eternal forms of good and evil, which God never violates, and which are discernible by reason.

In the seventeenth-century dispute concerning ‘the rule of faith’ or the ultimate criterion of religious knowledge, the Cambridge Platonists stood firmly in the camp of reason. They opposed enthusiasm, which appealed to

inspiration, no less than Roman Catholic ‘dogmatism’, which referred to apostolic tradition. It is important to recognize, however, that the Cambridge men defended reason only because they had a Platonic conception of it. They saw reason as a mystical faculty, a power of vision, which is guided by divine grace. They opposed the formal concept of reason prevalent in the nominalist tradition, according to which it is merely a power of inference. They also rejected Socinianism because of its critical attitude toward traditional Christian doctrine (see Socinianism).

During the seventeenth-century controversy regarding ecclesiastical polity, the Cambridge Platonists attempted to walk a middle path between Laudianism and Puritanism, High-Church Anglicanism and Presbyterianism. They denied a common premise to these extreme positions: that church government and discipline is *jure divino*, prescribed by divine decree and determinable by Scripture. They argued that all such matters are indifferent, and should be determined by the civil sovereign alone. Anticipating the latitudinarians, they stressed the need for a comprehensive church whose creed was broad enough to accommodate all Christians (see Latitudinarianism).

2 Epistemology

The epistemology of the Cambridge school was chiefly a defence of essentialism and rationalism against the conventionalism and empiricism of the nominalist tradition (see Conventionalism; Empiricism; Essentialism; Rationalism). In his *A Treatise concerning Eternal and Immutable Morality*, the main epistemological work of the Cambridge school, Cudworth argued that things are what they are in virtue of the necessity of their nature or essence alone, and not in virtue of some divine command or power. God cannot make two plus two equal five, or the nature of a triangle such that its three angles are not equal to two right angles. It is an eternal and necessary truth that, given the concept of two and the concept of addition, two plus two equals four, and that, given the concept of a triangle, its three angles are equal to 180 degrees. Although the will of God is indeed the supreme efficient cause of all things, it is not their formal cause.

The Cambridge Platonists criticized empiricism as much as conventionalism. Anticipating Leibniz and Kant, Cudworth and More pointed out how the conditions of knowledge cannot be satisfied by the senses: knowledge requires judgment, but the senses do not judge. Knowledge also involves universality and necessity, whereas the senses show us only particularity and contingency. Furthermore, the senses are entirely passive, though knowledge demands activity, making sensations conform to innate laws. Finally, the object of the senses is given, distinct from the knower, but knowledge requires the identity of the knower and known, reason’s contemplation of its own creations. Contrary to empiricism, Cudworth advocated a rationalist paradigm of knowledge, according to which true knowledge derives from deduction, consisting in ‘a descending comprehension of a thing from the universal ideas of the mind, and not an ascending perception of them from individuals by sense’.

The Cambridge Platonists became notorious for their doctrine of innate ideas, which was the apparent target of Locke’s famous polemic (see Locke, J. §2). But Cudworth, More and Culverwell explicitly rejected the view that the mind has pre-formed ideas prior to experience. They understood innateness in terms of the inherent *activities* and *faculties* of the mind, and stressed that these had to be stimulated by experience.

Cudworth and More had a clear response to Descartes’ radical scepticism, which posed a serious challenge to the rationalism of the Cambridge school. They remarked that Descartes could not escape his radical doubt by his proof of the existence of God, since such a demonstration presupposes the truth of our faculties. They also maintained that there is a false premise behind Cartesian doubt: that knowledge requires the correspondence between concepts and an external reality. Since reason creates its object in the act of knowing it, we need not seek truth outside ourselves. Finally, they contended that we have no general reason to doubt our faculties if they normally supply clear and distinct ideas on specific occasions (see Descartes, R. §4).

3 Metaphysics

The Cambridge Platonists had an ambivalent attitude towards the new natural philosophy which blossomed during their era. They admired its methods of observation and experiment; they shared its distaste for the verbiage of the old scholasticism; and they accepted its naturalism, its belief that everything conforms to law. But they feared the consequences of the new mechanical model of explanation of Descartes and Boyle. If this paradigm were generalized, then it would leave no room for spirit, life or God. The aim of the Cambridge Platonists was therefore

to secure a place for spirit, life and God while upholding the naturalism and methods of the new philosophy.

Cudworth and More argued that mechanism alone cannot account for such phenomena as gravity and cohesion in the material world, or generation and growth in the organic world. To explain such phenomena, they postulated the existence of a ‘plastic power’ or ‘spirit of nature’, a concept deriving from the *logoi spermatikoi* or *rationes seminales* of the Stoic and Neoplatonic tradition (see Stoicism §5). This concept posits a living force within matter, a self-generating and self-organizing power. Although it is subconscious, this power is also purposive. It is the instrument of God himself, the means by which he achieves his ends in the material world. Cudworth and More denied that their spirit amounts to an occult force, and maintained that it alone avoids the extremes of supernaturalism and mechanism. If supernaturalism admits constant miracles in nature, mechanism derives design from chance. Only the plastic power explains design according to the requirements of naturalism.

To Henry More, the dangers of the new mechanism were most apparent in Descartes’ distinction between the mind and body as thinking and extended substance. If *only* matter is extended, then spirit cannot exist, because what is unextended does not exist anywhere or in any place. If something exists, then it must be somewhere, and therefore extended. Boldly, More concluded that spirit too is extended. He maintained that its essential nature consists in a fourth dimension, ‘spissitude’, the power to expand or contract the space it occupies. Far from being the exclusive attribute of matter, infinite space has many attributes in common with God himself, and it amounts to the divine presence in nature itself. This conception of space later inspired Newton to call space ‘the sensorium of God’ (see Descartes, R. §8; Newton, I. §3).

Although the Cambridge Platonists criticized Cartesian dualism, they introduced one of their own. They attributed opposing characteristics to spirit and matter: spirit is indivisible, active and penetrable, while matter is divisible, passive and impenetrable. Although they postulated their plastic power partly to uphold the continuity of nature, they also understood it to be a spiritual substance distinct in kind from matter. Unlike the vital materialists of the eighteenth century, they did not employ this doctrine to show that mind and body differ only in degree, as if they were only more or less organized forms of living force (see Dualism).

4 Ethics

The hallmarks of the ethics of Cambridge Platonism are realism and rationalism. Its realism grew from its reaction against Hobbes’ and Calvin’s voluntarism. What makes something good or evil, the Platonists contended, is not simply the will of some sovereign power, whether that is God or the civil ruler; rather, it is the thing’s eternal essence or nature, which exists independent of contract, convention or will.

The rationalism of their ethics is apparent from the insistence that we know the nature of good and evil through reason alone. They stress that reason determines not only the means, but also the ends of action. Although they were rationalists, they did not advocate an ethics of duty in the modern Kantian sense. Unlike Kant, they did not distinguish between adherence to principle and conformity to nature, the promotion of human perfection.

The Cambridge men also opposed Hobbes’ and Calvin’s determinism no less than their voluntarism. They defended freedom of the will in the strong sense as a *liberum arbitrium*: the power to choose and act otherwise, and not simply to act on my desires without constraint. They contended that moral responsibility is incompatible with the necessity prevalent in nature. They were especially repelled by the bleak view of humanity in Hobbes and Calvin, and denied that human nature had been so ruined by the Fall that it could not do good by its own efforts. Although they did not dispute the reality of sin, they regarded it as a *perversion* or *disorder* of an inherently good human nature. They also insisted that people are not naturally selfish and competitive. They stressed the social nature of man, and maintained that a person is only happy and fulfilled through a moral life.

In general, ethics played a central role in Cambridge Platonism and its doctrines became especially influential. It maintains that action, not contemplation, is the end of life, and that the highest knowledge is only the result of good conduct. Its emphasis upon reason, the social nature of man and the goodness of human nature constantly reappear in the late seventeenth and early eighteenth centuries. The Cambridge school was particularly influential on Samuel Butler, Shaftesbury and Richard Cumberland, and it was the inspiration behind the ethical rationalism of Samuel Clarke, John Balguy and Richard Price.

Campanella, Tommaso (1568-1639)

Tommaso Campanella was a Counter-Reformation theologian, a Renaissance magus, a prophet, a poet and an astrologer, as well as a philosopher whose speculations assumed encyclopedic proportions. As a late Renaissance philosopher of nature, Campanella is notable for his early, and continuous, opposition to Aristotle. He rejected the fundamental Aristotelian principle of hylomorphism, namely the understanding of all physical substance in terms of form and matter. In its place he appropriated Telesio's understanding of reality in terms of the dialectical principles of heat and cold; and he adopted a form of empiricism found in Telesio's work that included pansensism, the doctrine that all things in nature are endowed with sense. Especially after 1602, Campanella's exposure to Renaissance Platonism also involved him in panpsychism, the view that all reality has a mental aspect. Thus his empiricism came to show a distinctly metaphysical and spiritualistic dimension that transformed his philosophy. At the same time his epistemology embraced a universal doubt and an emphasis on individual self-consciousness that are suggestive of Descartes' views.

Campanella's career as a religious dissident, radical reformer and leader of an apocalyptic movement presents a political radicalism that was oddly associated with more traditional notions of universal monarchy and the need for theocracy. The only one of his numerous writings that receives attention today, La Città del Sole (The City of the Sun) (composed 1602, but not published until 1623), has come to occupy a prominent place in the literature of utopias though Campanella himself seems to have expected some form of astronomical/apocalyptic realization.

Campanella's naturalism, especially its pansensism and panpsychism, enjoyed some currency in Germany and France during the 1620s, but in the last five years of his life it was emphatically rejected by the intellectual communities headed by Mersenne and Descartes, as well as by Galileo.

1 Life

Son of an illiterate Calabrian cobbler, Giovanni Domenico Campanella adopted the name 'Tommaso' when he joined the Dominican Order in 1582. He was attracted to Naples as an intellectual centre, where he encountered the primitive experimentalism and magic of Giambattista Della Porta and his circle. There too in 1591 he published his first work, *Philosophia sensibus demonstrata (Philosophy Demonstrated by the Senses)*, which registered both his emphatic anti-Aristotelianism and his reception of Telesio's naturalism. As a result of his increasingly radical thought, he was hounded by the Inquisition. He suffered a series of trials, tortures and imprisonments, culminating with his twenty-seven year incarceration (1599-1626) by the Spanish viceregal regime for leading an abortive uprising. No matter how severe the conditions of his confinement, he managed to produce a vast number of works, some of which have never been recovered. It was through his writing that he managed to win his way out of prison to freedom in Rome (1626-34) where his astrological talents won him high favour from Pope Urban VIII. However, he was once more threatened by Spain, and fled to Paris where he was granted asylum by Louis XIII and Richelieu. During the last years of his life he prepared his works for publication while under royal protection.

2 Epistemology

It was in Campanella's *De sensu rerum et magia (On the Sense and Feeling in All Things and On Magic)*, first composed in 1590 and published in 1620, that he initially presented his emerging empiricism and his view that the perceived world is alive and sentient in all its parts. This work became the most widely read and influential of all his philosophical works, and remains central to his combination of naturalism and a degree of magic that enables us to manipulate natural processes. However, the most comprehensive and formal presentation of his philosophy is found in his *Metafisica* (1602-24; first published in 1638), which is representative of his mature thought. He divides the work into three parts: *principia sciendi* (epistemology), *principia essendi* (metaphysics) and *principia operandi* (moral and political philosophy); and it is noteworthy that he begins with the theory of knowledge. Thus, before he constructs a metaphysics, Campanella finds it necessary to establish the reality of knowing and of individual self-consciousness. He seems to have been the first philosopher to feel the need of explicitly stating the problem of knowledge as an introduction to his philosophy.

Although he had previously been satisfied through his long exposure to Telesio that the nature of all things

including human beings was basically sensory, by 1604 he had become convinced that the mind that God has infused into human beings not only has sensation and animal memory but something higher and more divine. This higher level of the intellect's functioning established individual self-consciousness. Here Campanella was more inspired by Augustine (§§5-6) than by Aquinas (§10) (his ostensible guide in most matters), especially in his pursuit of a universal theoretical doubt. He entertained the possibility of his own self-deception, and he made explicit reference, paraphrasing it at length, to the famous passage in *De civitate Dei (The City of God)* where Augustine counters the Academic sceptics with his 'If I am mistaken, I am' (XI.26). It is this direct intuition of oneself, this direct knowledge of our being, our knowing and our willing that is now grafted onto the general sensory nature in which the self, like all other things, participates. Although between 1617 and 1623 Descartes (§§3, 7-8) read more of Campanella than he ever wished to admit, the striking similarities between Descartes' views and Campanella's universal doubt, his emphasis on self-consciousness, and his principle *cognoscere est esse* (knowing is being) are more apparent than real. While Descartes creates an emphatic distinction between soul and body, Campanella, instead of separating the two substances, makes a Neoplatonic identification of being with thought, in which all things now share. The difference between them is that between a philosophy of instinct, sensation and *élan vital*, and a philosophy of mathematical certitude, clear and distinct ideas, and a universal, impersonal reason.

By intellect, Campanella understands two distinct faculties. The first is sensation (the *intellectus sensualis*), which humans have in common with animals, and which is capable of grasping particulars but is unable to go beyond the senses. The second is mind (the *intellectus mentalis*) which aspires to invisible and eternal realities. This two-fold view of the intellect is quite similar to that offered by Telesio (§5) in the later editions of his *De rerum natura iuxta propria principia (On the Nature of Things According to Their Own Principles)* (1586). Sense exhibits its own inherent certainty in its apprehension of singulars. Experience shows that to sense fire one need not apprehend the form of fire; rather it suffices simply to be slightly burned. On the basis of this initial passive perception, sense 'can infer the rest of the power of the object acting upon itself'. For Campanella, however, knowledge does not remain at this sensory, Telesian, level, but comes to involve a process of assimilation. Proceeding on the basis of his principle that knowing is being, he claims that things are known inasmuch as the knower becomes similar to them. However, he means by this something quite different from the assimilation of form to which Aristotle and Aquinas had referred. Each thing is sensed and known in so far as it is itself a sentient part of nature, and the knowing essence of the thing becomes the object to be known.

In practical terms, Campanella's empiricism manifests a clear respect for *testimonia* (the evidence of direct witness or experience) in preference to *opinio* (traditional belief based upon some distant authority). The best and most repeated example of this distinction is the witness of Christopher Columbus against the authority of Augustine and Lactantius on the existence of antipodes. Sense, here reading from Nature, God's book, attests to things as they are; opinion to what we have read from others.

Especially in his *Apologia pro Galileo* (written in 1616, published in 1622), Campanella accepts and pays considerable attention to the popular notion of the two Books of Scripture and of Nature. In the *Apologia*, he presents an important statement about freedom of thought and the relationship between God's two Books, though without in any way committing himself to the Copernican system that Galileo had defended (see Copernicus, N.; Galilei, Galileo §§1, 4). In what seems to be a continuous adjustment of the evidence from the two Books in order to achieve their conformity or agreement, Campanella grants both precedence and pre-eminence to the first Book, that of Nature. Yet while the new discoveries provided by the first Book would seem to dictate a reinterpretation of the second that would bring Scripture into conformity with Nature, the entire intellectual enterprise is predicated on the underlying assumption and confidence that there can be no disagreement between what is offered in the Book of Scripture and the findings of the Book of Nature.

3 Metaphysics

Campanella's philosophy of nature is inspired by Telesio's effort to explain nature through its own principles (*iuxta propria principia*) (see Telesio §2). From his first published work, he announced his opposition to Aristotle's hylomorphism. He rejects the idea of matter as pure potency actualized by form, and attributes to it a measure of reality all its own. Nor does he accept form in the scholastic sense, seeing it as the mode or quality of an object. Scorning the Aristotelian structure of matter as potency and form (whether substantial or accidental) as

act, Campanella hoped to build a new edifice on the Telesian foundation of heat and cold as active principles contending for sole mastery of matter as passive substratum. Unfortunately, inconsistency in terminology obscures the clarity of his distinctions and he was by no means completely successful in disentangling himself from the conceptual world and terminology of the Aristotelian tradition.

Campanella confidently asserted that the senses perceived body directly: body is body in its own right without needing an abstract form to make it so. Having renounced substantial forms, he substituted the two active principles of heat and cold. Form is replaced by *temperamentum*, the arrangement and blending of internal parts, as the structure of matter. A more positive evaluation of Campanella's rejection of hylomorphism has detected in this departure from the traditional Aristotelian metaphysical supports a desire to reduce occult phenomena to mechanical contact, to some sort of material force, or to an inhering structural resonance in all things.

Also in reaction to Aristotle, Campanella presented a Neoplatonizing metaphysics that seeks to be in accord with Telesian physics. The subtitle to his *De sensu* (1620) reads: 'the world is shown to be a living and truly conscious image of God, and all its parts and details to be endowed with sense perception, some more clearly, some more obscurely to an extent sufficient for their preservation and that of the entirety in which they share sensation…'. Sense makes the entire world a gigantic, feeling creature.

Campanella goes on to explicate the nature and structure of Being by means of his original doctrine of the primalities (*primalitates*), Power, Wisdom and Love. His reading of the universe as consisting of power, sense or knowledge, and love seems to be a natural outgrowth both of his pansensism and his Augustinian base. The three primalities, his 'Monotriad', provided him with the philosophical counterpart to the central Christian theological doctrine of the Trinity. As metaphysical principles, the primalities are so inherent in the effects they produce that Campanella can speak of their 'essentiating' a being. Lesser beings do not merely participate in the primalities; they are totally pervaded or 'coessentiated' by them.

While the three principles of this 'coessentiation' are the same by virtue of their function, they differ in terms of their origin. Love derives from wisdom and power, and wisdom derives from power alone. Power is thus the source of the other two, though the operation and functioning of all three primalities presupposes their transcendent unity. These relationships are seen in all created beings, for being itself is a transcendental composite of power, knowledge and love. Wisdom, the second primality, is particularly important, for its effects help explain Campanella's doctrine of universal sensation. Primal wisdom endows all things, whether rational, animal, or material, with some measure of sense perception, and it is in this way that all created beings are essentially related to one another and participate in the essence of the infinite being. Love as the third primality is the manifestation of wisdom, for love and knowledge, appetite and perception are conjoined. Love involves a process of becoming something else, the subject becoming imperfectly the object loved. Thus the doctrine that knowledge involves assimilation has a metaphysical basis. Here, as with Campanella's understanding of magic and of natural religion, a general indebtedness to Ficino (§§2, 4) is perceptible.

From this cosmology, the human being emerges as a microcosm or little universe, though Campanella preferred the term *epilogo* (epilogue) for this familiar Renaissance idea. The human microcosm conjoins five worlds or orders: (1) the archetypal world, which is infinite, eternal, and contains the archetypes of all possible worlds; (2) the mental or metaphysical world, that of angelic and human minds, composed of the primalities; (3) the mathematical world or universal space, which constitutes the basis or substratum of all bodies in an unchanging space; (4) the material world whose regular alterations place it above time, so that it participates in the perpetuity of the mathematical world; (5) the fifth, localized world, characterized by time, which is found within the fourth world and is the product of the two active principles. The five orders of being are so interrelated that whatever is in a superior world is by participation in the lower worlds, and whatever is in an inferior world is in an eminent way in those above. The human being as *epilogo* is understood as the ultimate epitome of all five worlds. This account of the microcosm is the corollary of the doctrine that the universe itself, the macrocosm, is a most perfect animal with its own body, spirit and soul (see Cosmology §1).

4 Moral and political philosophy

Campanella distinguishes three aspects of moral or practical philosophy: ethics, economics and politics, the last of which far outweighed the other two in importance. In his ethics he rejects the idea of the supreme good as

something extrinsic to humans, and he also rejects Aristotle's belief that the contemplation of truth is the supreme end for humans. Instead, he affirms the ideal of happiness as consisting in self-conservation, and the direction of all one's efforts towards God, who alone can guarantee this conservation. Beatitude then becomes a union effected with God through power, wisdom and love rather than through any intellectual contemplation. Campanella's understanding of virtue and the virtues follows from his understanding of the supreme good, for virtue has its ground in the three primalities. Virtue is seen as a power proceeding from the very nature of being, and manifesting itself in the operations of power, wisdom and love, which it helps perfect. In his deployment of a number of virtues, Campanella departed from the traditional framework of the four cardinal virtues, and made considerable use of St John Chrysostom, among the Church Fathers.

The focus and realization of the basically social nature of human beings occurs in the individual household, which includes the immediate family, its servants and even the domestic animals. In considering the economy of the family, which differs only in degree rather than in kind from the political state, Campanella asserts the centrality of marriage as a contract of natural law, sanctified by Christ as a sacrament. If some of his recipes for sexual relations, child-rearing and the education of the young suggest the calculations and concerns of the Solarians in his imaginary City of the Sun (see below), there is no hint of the Solarian community of women to be found in his treatment of marriage. Campanella is thus generally orthodox in his understanding of marriage within the present temporal dispensation, although the wife exercises a responsible role within the conservative structure headed by the *paterfamilias*.

Politics early became the pre-eminent consuming interest of the radical Dominican reformer - an interest, which when driven by the heady combination of astrology, magic and messianism led to a popular uprising, and to Campanella's long imprisonment. His famous work *La Città del Sole (The City of the Sun)* (first published in 1623), traditionally understood as being simply the account of an ideal society, and thus relegated to utopian literature (see Utopianism §1), is more accurately understood as representing part of Campanella's millenarian expectation. It seems hardly accidental that he composed the work in 1602 only a year before the expected astronomical conjunction of planets figuring the sun's descent towards the earth, set for December 1603. Despite the apparent incommensurability of the then-current Christian economy with the rationally organized, communistic millenarian economy which Campanella saw as impending, there is a complementarity between the City of the Sun and the theocratic papal monarchy advanced by his other political writings: namely, the amalgamation of secular and spiritual into a comprehensive universal monarchy ruled by a priest-king.

From the very beginning two themes pervade Campanella's political philosophy: (1) the necessity of religion's informing politics; (2) the necessity for universal monarchy. These two threads, running through his entire thinking, intersect in his affirmation of the papal office as the effective expression and realization of power on earth. Monarchy is not simply the noblest form of government, but in Campanella's hands it came to be understood as something universal, all-inclusive and above the present clutter of kingdoms and empires. With Christ seen as the founder of universal monarchy, the designation of monarch properly pertains to the Pope, who when endowed with both temporal and spiritual arms, can serve as moderator among princes, and can prevent any Christian prince from arriving at the monarchy of Christendom. Campanella was scandalized by Dante's dualism of church and empire (see Alighieri, Dante §3), and wished to fuse secular and spiritual power in the monarchy of the priest-king. Thus one can only understand the monarchy of Spain (the ruler of Naples, and together with the Roman Inquisition, author of Campanella's misfortunes) as the Arm of God when it is in close association with, dependence on, and service to the papacy; the territorial aggrandizement of Spain can have the papal blessing only in so far as it serves the universal propagation of the true religion. After 1634, Campanella was to put France forward as the Pope's secular agent.

Campanella is a Machiavellian of sorts. Although apart from Aristotle himself no other so provoked the hostility of Campanella as did Machiavelli and his reason of state, none the less Campanella could accept much of his predecessor's appreciation of power, its defence and increase through deception and harsh, sometimes immoral measures. On the other hand, he could not admit the divorce of politics from religion or the reduction of religion to some form of political manipulation and a mere means of ruling (see Political philosophy, history of §5). Affirming religion's political utility, Campanella seeks to incorporate the state into his church, empowering Christianity under the aegis of the armed priest-king. He wants to have his religion both ways: as justified on utilitarian grounds, and as the comprehensive, informing, living truth.

Campanella's entire thought reflects an emotional predisposition to innovation and a commitment to mint a new philosophy, eclectic and Platonizing, that is ostensibly more supportive of Christianity than the philosophy of Aristotle.

List of works

Most of Campanella's works went through numerous stages of complex redaction before publication; for details see Firpo (1940) in references and further reading.

Campanella, T. (1591) *Philosophia sensibus demonstrata (Philosophy Demonstrated by the Senses)*, Naples: Orazio Salviano; ed. L. de Franco, Naples: Vivarium, 1992. (Campanella's first publication and first formal venture into philosophy, composed 1589 but not published until 1591. Registers his emphatic anti-Aristotelianism, the reception of Telesio's philosophy and its transfer into a metaphysical key; precedes his magical, astrological and Gnostic speculations and his later interest in celestial, political and religious palingenesia.)

Campanella, T. (1620) *De sensu rerum et magia (Of the Sense and Feeling in All Things and on Magic)*, Frankfurt: Gottfried Tampach; repr. in L. Firpo (ed.) *Tommaso Campanella, Opera latina, Francofurti impressa annis 1617-1630*, Turin: Bottega d'Erasmo, 1975; English trans. of Book I and some chapters of Book IV (incorrectly designated Book V) in A.B. Fellico and H. Shapiro (eds) *Renaissance Philosophy; the Italian Philosophers*, New York: Modern Library, 1967, 338-79; partial English trans. of Book II by B. Dooley, *Baroque Italy: Selected Readings*, New York: Garland Press, 1995.(Composed first in Latin in 1590, then recomposed in Italian in 1604; a critical edition of the more definitive Italian version is available as *Del senso delle cose e della magia*, ed. Antonio Bruers, Bari: Gius. Laterza & Figli, 1925. After its publication in 1620, *De sensu* became the most widely read and influential of Campanella's philosophical works during the seventeenth century and remains central to his total naturalistic, magical position.)

Campanella, T. (1622) *Apologia pro Galileo*, Frankfurt: Gottfried Tampach; repr. in L. Firpo (ed.) *Tommaso Campanella, Opera latina, Francofurti impressa annis 1617-1630*, Turin: Bottega d'Erasmo, 1975; trans. R.J. Blackwell, *A Defense of Galileo, the Mathematician from Florence*, Notre Dame, IN, and London: University of Notre Dame Press, 1994.(Composed in 1616, presents an important statement of *libertas philosophandi* and the relationship between God's two Books without in any way committing the author to the Copernican system; Blackwell's is the best English translation.)

Campanella, T. (1623) *La Città del Sole: Dialogo Poetico; The City of the Sun: A Poetical Dialogue*, trans. and ed. D.J. Donno, Berkeley and Los Angeles, CA, and London: University of California Press, 1981.(Although composed in 1602, *La Città del Sole* was not published until 1623; most famous as a work of utopian literature.)

Campanella, T. (1636) *De gentilismo non retinendo (On that Paganism that must not be Maintained)*, Paris: Toussaint Dubray; Italian trans. R. Amerio, *Della necessità di una filosophia cristiana*, Turin: Società editrice internazionale, 1953.(Composed originally 1609-10; more than usually pungent effort on Campanella's part to mint a new Christian philosophy, eclectic but exclusive of Aristotle.)

Campanella, T. (1638) *Metafisica: universalis philosophiae seu metaphysicarum rerum propria dogmata (Metaphysics: The Essential Doctrines of Universal Philosophy or Metaphysical Things)*, ed. P. Ponzio, Bari: Levante, 1994; repr. L. Firpo, Turin: Bottega d'Erasmo, 1961; Latin-Italian abridged version, G. di Napoli (ed.) *Metafisica*, Bologna: Zanichelli, 1967, 3 vols.(First published in Paris in 1638, following four redactions 1602-24. Constitutes the most comprehensive, cumulative and formal presentation of Campanella's philosophy. One of the great dinosaurs of seventeenth-century philosophical production, di Napoli's Latin-Italian abridged version is more manageable.)

Campbell, George (1719-96)

George Campbell, Scottish minister, professor and religious thinker, is now remembered primarily for The Philosophy of Rhetoric (1776). Here he employed the Scottish Enlightenment's developing science of human nature to explain the effectiveness of the classical rules of rhetoric. He did this by relating the various ends of persuasive discourse to the natural faculties and propensities of the human mind. In his own time Campbell was better known as a religious apologist, using an enlightened theory of evidence in A Dissertation on Miracles (1762) to defend the believability of Christian miracles against the sceptical attack of David Hume.

George Campbell was born in Aberdeen and educated at the town's Marischal College. He was ordained in the established Church of Scotland in 1748 and was minister of a country parish for nearly a decade. Upon returning to Aberdeen, he helped found the influential Aberdeen Philosophical Society, whose members included Thomas Reid, Alexander Gerard and James Beattie (see Aberdeen Philosophical Society). He was appointed to the posts of Principal and Professor of Divinity in Marischal College in 1759 and 1771 respectively, which he held jointly until the year before his death.

Campbell's best known work today is *The Philosophy of Rhetoric* (1776), which earned its title by combining classical rhetorical theory with the Scottish Enlightenment's attempt to develop a comprehensive science of human nature (see Enlightenment, Scottish; Human nature, 18th-century science of). Campbell argued that the rhetorical standards established by the ancients were definitive, and could be used to explore the principles of human nature that made those standards universal. He linked the four ends of speaking, which were 'to enlighten the understanding, to please the imagination, to move the passions, or to influence the will', with the qualities of style, perspicuity and vivacity, that most effectively brought about persuasion (Campbell 1776: 1). He also employed the Scottish Enlightenment's principle of sympathy to explain how an orator communicated passions as well as believability to his audience.

Perhaps the most important philosophical aspect of *The Philosophy of Rhetoric* is its theory of evidence. Campbell divided evidence into two types, intuitive and deductive. Intuitive evidence is immediately convincing to the mind and provides a necessary foundation for rational and empirical argument. It includes evidence from pure intellection (self-evident mathematical axioms and definitions), consciousness (one's own being and sensations), and common sense (indemonstrable but indispensable premises of moral reasoning). Deductive evidence, by contrast, produces conviction mediately, by either logical or factual demonstration, denominated demonstrative and moral evidence. Demonstrative evidence concerns invariable mathematical and geometrical relations and is capable of absolute proof. Moral evidence concerns contingent matters of fact rather than necessary relations, and its proofs are only probable at best. It is, nevertheless, the most important kind of evidence, for it includes all human experience and testimony, and constitutes the proper province of rhetoric.

Campbell's philosophy was influenced by that of David Hume, though Campbell employed much effort in correcting Hume. Campbell followed Hume in equating experience with the habitual associations of ideas in the mind, but thought that Hume's extreme emphasis on personal experience seriously undervalued the importance of memory (the only voucher for the past evidence of the senses) and of testimony to human knowledge as a whole. He therefore employed Common Sense philosophy to defend the necessary reliance of human beings on their own memories and on the testimony of others (see Common Sense School). His theory of evidence was a significant and original contribution to Common Sense philosophy, particularly in its explication of intuitive knowledge and its emphasis on testimony, though his use of that philosophy was otherwise minimal and not nearly as extensive as the version employed by Thomas Reid.

The methods and concerns of *The Philosophy of Rhetoric* were those of the Scottish Enlightenment, but its rhetorical strategy was aimed primarily at religious persuasion. Campbell's theory of evidence provided a philosophical foundation for his Christian apologetics, as exemplified by *A Dissertation on Miracles* (1762). This work was written against Hume's essay 'Of Miracles' (1748), which had claimed that a miracle could not be believed because the testimonial evidence in its favour necessarily contradicted our uniform experience of the laws of nature. Campbell argued that our knowledge of the laws of nature depended more upon the testimony of others than upon our personal experience. We could therefore no more reject the testimony of reliable witnesses

concerning particular facts than we could the general testimony that had established the empirical laws of nature in the first place. He then attempted to demonstrate that only early Christian claims of miracles were sufficiently reliable to overturn the general experience of human history.

Campbell was a relentless advocate for religious toleration and freedom of expression. His *Address to the People of Scotland* (1779; see Campbell 1762) defended the civil rights of Roman Catholics, though his outspokenness earned him the wrath of many of his Protestant countrymen. He argued that persecution was unchristian, counterproductive and philosophically indefensible. In a later manuscript (now in Aberdeen University Library) he contended that belief in abstract doctrines is the involuntary consequence of the passive mind’s perception of evidence. Only argument and persuasion are compatible with the realities of the human mind and with the spirit of the gospel of Christ.

Campbell’s reputation in his own lifetime rivalled that of almost any participant in the Scottish Enlightenment, and rested primarily on his religious writings, which included his posthumously-published divinity lectures. His contemporaries believed his masterpiece to be *The Four Gospels* (1789), which contained dissertations on the proper method of translating ancient documents, and which advocated enlightened principles of biblical criticism. Since his death, *The Philosophy of Rhetoric* has become a standard text on the subject as well as the object of considerable scholarly interest. It has eclipsed all his other writings.

Campbell, Norman Robert (1880-1949)

Campbell made important contributions to philosophy of science in the 1920s, influenced by Poincaré, Russell and his own work in physics. He produced pioneering analyses of the nature of physical theories and of measurement, but is mainly remembered for requiring a theory, for example, the kinetic theory of gases, to have an 'analogy', that is, an independent interpretation, for example, as laws of motion of a swarm of microscopic particles.

The British philosopher of science Norman Robert Campbell, who became a Fellow of Trinity College Cambridge in 1904, was also an experimental physicist, and worked on the research staff of the British General Electric Company from 1919 to 1944. His main contribution to philosophy, published in 1920, is his account of how physical theories explain laws. It maintains an absolute distinction between laws relating observable properties of objects, on which agreement can be achieved, and theories used to explain them. It could allow a weaker distinction, letting accepted theories come to state laws needing further explanation. But only an implausible view of the significance of the distinction can save its claim that theories need analogies.

Campbell's account of theories credits them with three components, illustrated by a simplified version of the kinetic theory of gases. First there is a theory's 'hypothesis', its mathematical propositions, empirically uninterpreted. Then there is a 'dictionary', linking terms of the hypothesis to observable terms used to state the laws the theory explains. Thus in his example the dictionary identifies the volume V, mass M, pressure P and absolute temperature T of a gas with combinations of constants and variables postulated by the hypothesis: for example, $V = l^3$, where l is a constant, $M = nm$, where m is a constant and $3n$ the number of variables dependent on the independent variable t (time). This hypothesis and dictionary entail the perfect gas law, $PV \propto T$.

But arbitrarily many formal systems, suitably interpreted, would also entail this law. To *explain* it, ' the propositions of the hypothesis must be analogous to some known laws': here 'the laws which would describe the motion of … [n] infinitely small and highly elastic particles [of mass m] … in a cubical box [of size l]' (1920: 128-9). Thus for Campbell an analogy is an essential part of a theory, not a dispensable aid to its formation: ' to regard analogy as an aid to the invention of theories is as absurd as to regard melody as an aid to the composition of sonatas' (1920: 130).

The importance of Campbell's main distinction, between propositions linking a theory's terms to each other and those linking them to others in the laws it explains, is now widely accepted if differently expressed. (For example, Nagel (1961) uses 'calculus' for Campbell's 'hypothesis' and 'correspondence rules' for his 'dictionary'.) But few now accept that a theory needs an analogy (which Nagel called a 'model'), a thesis that falls between two stools. First, a theory needs no analogy on an instrumentalist reading of it as a formal device linking laws statable in other terms: for then, since its hypothesis states nothing either true or false, its terms need no interpretation. But nor does it need an analogy on a realist reading of its hypothesis as consisting of true or false propositions. For then what these propositions state if true are not merely *analogous* to laws governing (for example) the motion of particles: they *are* laws governing the motion of the particles which the kinetic theory says compose a gas. Only if a hypothesis comprises propositions that are true or false but different in kind from those that state laws is Campbell's case for analogy tenable; but his - basically epistemological - argument for this was always weak and has been weakened further by later work on the meaning of theoretical terms in science (see Theories, scientific §§2, 7).

Although most physical laws relate measurable quantities, measurement remains an underrated topic in the philosophy of science. Campbell was one of the first philosophers to recognise its importance, observing that physics 'might almost be described as the science of measurement'. He saw that measurement itself depends on laws, like those giving physical sense to functions (addition, subtraction, multiplication) of the numbers used to measure quantities like length. His systematic account of this dependence, of the difference between fundamental and derived magnitudes, of the significance of units and dimensions, and of errors of measurement, set the agenda for later theories, which remain indebted to it.

Camus, Albert (1913-60)

Albert Camus was awarded the Nobel Prize in 1957 for having 'illuminated the problems of the human conscience in our times'. By mythologizing the experiences of a secular age struggling with an increasingly contested religious tradition, he dramatized the human effort to 'live and create without the aid of eternal values which, temporarily perhaps, are absent or distorted in contemporary Europe'(1943). Thus the challenge posed by 'the absurd' with which he is so universally identified.

Camus' most celebrated work is *L'Étranger* (*The Stranger*) (1942). Depicting the 'metaphysical' awakening of an ordinary Algerian worker, Camus concretizes the Pindarian injunction, provided as life's answer to 'the absurd' in an epigram to *Le Mythe de Sisyphe* (*The Myth of Sisyphus*) (1943): 'Oh my soul do not aspire to immortal heights but exhaust the field of the possible.'

But if the 'absurd' defines our world, it was never treated by Camus as a conclusion, only 'a point of departure'.

> What else have I done except reason about an idea I discovered in the streets of my time? That I have nourished this idea (and a part of me nourishes it still) along with my whole generation goes without saying. I simply set it far enough away so that I could deal with it and decide on its logic.
>
> (1954)

How and what morality is still possible, then, in view of the experience of 'the death of God' which has given birth to the experience of absurdity? While the absurd leaves humans without justification and direction, rebellion bears witness to the refusal of human beings to accept this incipient despair.

By demanding an end to oppression, rebellion seeks to transform - by revolution if necessary - the conditions that gave rise to it. Rebellion thus testifies to the human being's incessant demand for dignity. But it is often a vain yearning without a revolutionary transformation of the institutional structures of exploitation and oppression. Yet that transformation only promises further and even greater humiliation if it is not continually guided by the spirit and concerns of rebellion. Appalled by the totalitarian direction of many modern revolutionary movements, Camus thought he detected a messianic nostalgia lurking at the core of Western rebellions. He saw them driven by an often unexpressed need to replace the failed vertical transcendence of Judaeo-Christianity with a new horizontal transcendence.

L'Homme revolté (*The Rebel*) (1951) his major work in political theory, thus seeks to diagnose a way of thinking that has led rebellious thought from its initial generous impulses down the path of destruction, thus undermining one of the few sources of hope in our post-Christian world.

Rebellion and revolution have often, however, been falsely seen as polarized for Camus. Their opposition, rather than being necessary and celebrated, as has been claimed by both right- and left-wing detractors, is the death of both of them. The ground of any meaningful development of rebellion must be the implicit community of humans for whom value is demanded. Here is the crux of Camus' critique of 'legitimate murder', including capital punishment, which has led him, mistakenly, to be defined as a pacifist. Self-defence is justified, both individually and collectively, but pre-meditated or logical murder in the service of any cause whatsoever is not. It undermines the one undeniable community of humans confronting the universe, destroying the grounds of the possibility of coherent social values.

Thus Camus rejected any theory that argued that the ends justify the means. There are no transcendent ends. All ends are visions of transformed futures which themselves will simply be means for further action. If the ends justify the means, what then can justify the ends? His answer is the means - because they are simply more proximate ends in the service of a transformed quality of life that must always be lived concretely in the temporally unfolding present, ever confronted with injustice and exploitation, envisaging a transformed future that action may aspire to bring into being.

Throughout his life his thought was deeply marked by his experience. A French-Algerian from a poor working-class district of Algiers, Camus confronted Western civilization from the margins. Separated by ethnicity and culture from the Muslim majority, and by class from the ruling French *colons*, his attitude toward Europe

remained ambivalent: drawn by the brilliance of its cultural expressions yet repelled by the scope of its brutalizing inhumanity.

To an emerging class sensitivity was added an anguished awareness of human finitude, poignantly brought home by contracting tuberculosis and facing death at the age of 17. A very personal urgency thus vitalized his metaphysical reflections. His mature work is marked by the conflicted awareness of the sensuality of the body in direct contact with a vibrant nature confronting the inevitability of ageing and death in a stark landscape without illusions.

Almost alone among traditional intellectuals, Camus remained tied by sensitivity and vision to his working-class origins. His values drew more from the communal experiences of college soccer than from the theoretical speculations of our greatest writers. The egalitarian collective effort of the Workers' Theatre that he led in the mid-1930s, where stars did not take bows and everyone pitched in with the staging, suggested to him the outlines of a truly just society.

An advocate of 'relative utopias', the renaissance, to the creation of which Camus always remained passionately committed, meant the qualitative transformation of daily life, the creation of dialogic communities at work and at home that gave voice and sustenance to the struggles for dignity of ordinary people. He continued to believe that only when the dignity of the worker and respect for intelligence are accorded their rightful place can human existence hope to realize its highest ideals, and our life find the collective meaning and purpose that alone can truly sustain us in the face of an infinite and indifferent universe.

Cantor, Georg (1845-1918)

Georg Cantor and set theory belong forever together. Although Dedekind had already introduced the concept of a set and naïve set theory in 1872, it was Cantor who single-handedly created transfinite set theory as a new branch of mathematics. In a series of papers written between 1874 and 1885, he developed the fundamental concepts of abstract set theory and proved the most important of its theorems. Although today set theory is accepted by the majority of scientists as an autonomous branch of mathematics, and perhaps the most fundamental, this was not always the case. Indeed, when Cantor set out to develop his conception of sets and to argue for its acceptance, he initiated an inquiry into the infinite which raised questions that have still not been completely resolved today.

1 Cantor's development of set theory

Cantor was born to a wealthy merchant family in St Petersburg and first went to Germany (Frankfurt) at the age of eleven. He studied in Zurich, Göttingen and (mainly) in Berlin, under Kummer, who directed his dissertation (completed in 1867), Weierstrass and Kronecker. In 1869, after a brief intermezzo as a teacher, Cantor went to Halle as a *Privatdozent*. Despite persistent attempts to secure a better position at a more prestigious university, he spent his entire career there, dying in 1918 after several bouts of manic depression. Thanks to the efforts of Hilbert, Zermelo, Fraenkel and many others he did see his ideas accepted by the majority of mathematicians.

The beginnings of Cantor's work on set theory emerged towards the end of 1873 in an exchange of letters with his colleague Richard Dedekind (see Cantor and Dedekind 1937). In a letter dated 29 November Cantor asks whether there is a one-one correspondence between the real numbers and the natural numbers. He already knew, from Dedekind, that it was possible to put the algebraic numbers into one-one correspondence with the natural numbers. He doubted that the same was true of the real numbers because the reals form a continuum while the natural numbers are discrete. As far as we know, Dedekind did not answer the question, believing it to be of no practical importance (although he saw its theoretical relevance).

In his next letter (7 December) Cantor answered his own question: he informed Dedekind that he had a proof of the impossibility of a one-one correspondence between the real numbers in the open unit interval (that is, those between, but not including, 0 and 1) and the natural numbers. This was the first proof that the real numbers are 'uncountable'. A few months later (1874), Cantor published his proof under the rather misleading title 'Über eine Eigenschaft des Inbegriffes aller reellen algebraischen Zahlen' (On a Property of the Set of all Real Algebraic Numbers). The main result, not mentioned in the title, had as a consequence the proof of the existence of 'transcendental' - that is, non-algebraic real - numbers.

This little-noticed paper showed for the first time that different 'levels' of infinity must be distinguished and this result, perhaps more than any other, triggered the further development of set theory. Dedekind was probably the only mathematician at the time who understood the real significance of this work, correcting his previous opinion of the practical unimportance of Cantor's question as 'conclusively rejected by Cantor's proof'. But what is its significance? First, the proof shows that the distinction between different levels of infinity is not empty - by no means a trivial result because until Cantor almost all mathematicians believed there to be essentially only one 'size' of infinity. Second, it challenges the Aristotelian dogma that the infinite exists merely potentially, but not actually.

In his next paper, 'Ein Beitrag zur Mannigfaltigkeitslehre' (1878), Cantor considered the 'power' of sets: two sets are of equal power (cardinality) if there is a one-one correspondence between their elements. He tried to show that there exist sets of higher cardinality than the continuum by showing that a continuum of two dimensions cannot be mapped one-one onto a continuum of one dimension. To his own surprise, however, the result was exactly the opposite: all continua of any countable dimension have the same cardinality as the linear continuum (the real numbers).

$$|\mathbb{R}\times\mathbb{R}\times\mathbb{R}\times\ldots| = \ldots = |\mathbb{R}\times\mathbb{R}| = |\mathbb{R}|$$

This unexpected result led Cantor to state for the first time his famous 'continuum hypothesis': that in the linear continuum of real numbers exactly two classes of infinities are represented - countable (the cardinality of the natural numbers) and uncountable (the cardinality of the reals) - with none in between (see Continuum hypothesis;

Set theory §3).

The following six years were the most fruitful of Cantor's life. Not only did he publish (in six parts) the paper 'Über unendliche lineare Punktmannigfaltigkeiten' (On Infinite Linear Manifolds of Points), but he also developed his 'arithmetical' theory of the infinite. The first step in the development was the introduction of 'derived sets' represented by the symbols '∞', '$\infty + 1$', and so on. Later he took these symbols as representing transfinite ordinal numbers. He defined a generalized 'successor' operation, and a 'supremum' operation which gives the limit of an infinite sequence of ordinal numbers. Starting from 0, the ordinal of the empty set, the 'successor' operation generates the sequence of natural numbers and the 'supremum' operation secures the existence of the first transfinite number - the ordinal of the set of natural numbers - called ω_0 or ω. The 'successor' operation in turn generates the numbers $\omega + 1, \omega + 2, \ldots$ and the 'supremum' operation then guarantees the existence of $\omega + \omega$, and so on. (See Set theory §2.)

Cantor divided the ordinals into number classes. The first number class is the class of natural numbers, which has cardinality $\aleph_0$ ('aleph-nought' or 'aleph-null'). It has to be exhausted before ω, the first number of the second number class, is created. The second number class is the set $\{\omega, \omega + 1, \omega + 2, \ldots, \}$, each element of which has cardinality $\aleph_0$. The cardinality of the second number class itself is $\aleph_1$. Cantor proved that $\aleph_1$ is the next largest cardinal after $\aleph_0$. In this terminology the continuum hypothesis becomes the conjecture that the cardinality of the continuum is $\aleph_1$ (see Continuum hypothesis §2).

2 The philosophical implications

Cantor's work on the infinite did not end with his arithmetical analysis of it. In his 1883 essay 'Grundlagen einer allgemeinen Mannigfaltigkeitslehre', he also tried to answer philosophical objections to the idea of actually existing, completed infinite classes.

One objection rested on the supposition that infinite numbers must obey exactly the same laws as finite numbers. But, as Cantor had shown, transfinite numbers have their own peculiar arithmetical laws - for example, the commutative law of addition $(a + b = b + a)$ does not hold for ordinals. This means that transfinite numbers are not finite numbers but not that they are not numbers.

Another objection related to the impossibility of completing a limiting process such as that of approaching the transcendental number π. This was more difficult to deal with. Cantor developed his counter-argument in two steps: first, he argued that the infinite as it occurs in a limit-process is, properly speaking, only a variable approaching a certain limit but still itself always remaining finite. In the second step, he pointed to the logical aspect of quantification; in particular, to the fact that the use of a variable presupposes the specification of a closed domain over which it varies. Hence, a limit-process - like a general statement concerning all numbers - presupposes logically that the infinite domain of numbers is actually and not only potentially given.

Neither argument is, however, completely convincing. With respect to the first, it turned out that the question of consistency is more difficult to resolve than Cantor had imagined. Indeed, set theory, as it was conceived by Cantor, entailed also 'inconsistent sets' and, hence, inconsistencies as Cantor himself noted in a letter to Hilbert in 1897 (see Paradoxes of set and property §1). But even when the inconsistency had been removed by Zermelo, the problem of proving the consistency of the improved set theory remained.

The second argument blurs the distinction between mathematics and logic. This results from the fact that mathematical induction - as it is used in the limit-processes in analysis - is logically analysed as a universal claim about an infinite domain, which is supposed to be completely finished. 'In the system of set theory mathematics has no specific content, it is nothing but logic, which has come to maturity' as Weyl said (1925). Indeed Cantor's argument for the existence of transfinite numbers, or, as he says, for their 'immanent reality', rests on the assumption that we can 'run through' an infinite sequence of numbers and exhaust it. But this is - epistemically speaking - impossible. It presupposes, as Hilbert has shown (1926: 174-8), certain ideal assumptions regarding the logical notions of 'all' and 'existence'.

Cantor’s theorem

Cantor’s theorem states that the cardinal number (‘size’) of the set of subsets of any set is greater than the cardinal number of the set itself. So once the existence of one infinite set has been proved, sets of ever increasing infinite cardinality can be generated. The philosophical interest of this result lies (1) in the foundational role it played in Cantor’s work, prior to the axiomatization of set theory, (2) in the similarity between its proof and arguments which lead to the set-theoretic paradoxes, and (3) in controversy between intuitionist and classical mathematicians concerning what exactly its proof proves.

Cantor’s theorem states that the cardinal number (‘size’; see Set theory §3) of the power set $\wp(A)$ of any set *A* (that is, the set of all subsets of *A*) is greater than the cardinal number of *A* itself.

One of the seemingly paradoxical properties of infinite sets is that they can be put into one-one correspondence with proper parts of themselves. For example, the function $f(n) = 2n$ maps each natural number to exactly one even number. If one-one correspondence is taken to indicate sameness of size for infinite sets, as it does for finite ones, then this means that the set of natural numbers must be said to be the same size as the set of even numbers, even though intuitively one would think that there should be twice as many natural numbers as there are even numbers. If any infinite set could be put into one-one correspondence with any other, there would be little point in trying to use ‘numbers’ as means of ‘size’ comparison for infinite sets. This is why Cantor’s proof that there are infinite sets which cannot be put into one-one correspondence with each other was crucial to the development of his theory of transfinite ordinal and cardinal numbers.

Cantor was seeking a characterization of the structure of point continua and his original result (1874) was that no denumerable sequence of elements in an interval $[a, b]$ of the real line can contain all the elements of $[a, b]$. From this he concluded that a continuum of real numbers cannot be uniquely correlated with the natural numbers. To transform this result into what has become known as Cantor’s theorem required making sense of the idea that every set, finite or infinite, has a cardinal number (sets between which there exists a one-one correspondence being deemed to have the same cardinal number); developing an arithmetic of infinite cardinal numbers; and establishing the existence of a one-one correspondence between the real numbers in any continuous interval and the set $\wp(\mathbb{N})$ of all subsets of the set $\mathbb{N}$ of natural numbers. The non-denumerability of the real numbers then becomes a special case of the more general set-theoretic result.

Russell was able to produce a contradiction in Frege’s system of logic by considering the class of all classes that do not belong to themselves (see Paradoxes of set and property §4). A similar strategy is used to prove that there would be a contradiction if there were a one-one function *f* mapping a set *A* onto its power set $\wp(A)$. Consider $d = \{x \in A\colon\ x \notin f(x)\}$. This is a subset of *A* and hence $d \in \wp(A)$. Since *f* correlates every member of $\wp(A)$ with a unique member of *A*, there is a unique element $a_d \in A$ such that $d = f(a_d)$. But both $a_d \in d$ and $a_d \notin d$ entail contradictions. Since the existence of *A* and of $\wp(A)$ are not in question, there can be no such *f* which is both one-one and onto.

In the case where *A* is finite or denumerable, *d* coincides with the diagonal set, which is defined by interchanging 0’s and 1’s down the diagonal of a square array such as the following (in which 0 indicates that a_i belongs to $f(a_i)$ and 1 that it does not).

	$f(a_1)$	$f(a_2)$	$f(a_3)$	$f(a_4)$	$\dots$
a_1	0	1	1	0	$\dots$
a_2	0	0	1	1	$\dots$
a_3	1	1	1	0	$\dots$
a_4	1	0	0	1	$\dots$
$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$

While there is general agreement that such an argument can be used to establish, for example, that for any given enumeration of the real numbers it is possible to specify a real number which is not included in that enumeration, the step to concluding from this that there exists a set whose cardinal number is greater than that of the natural

numbers is disputed by those who, like the intuitionists, do not accept the existence of actually infinite totalities (see Constructivism in mathematics; Intuitionism). Instead they may interpret the result as reflecting the difference between natural numbers and real numbers. The latter must be defined via potentially infinite sequences of rational numbers or potentially infinite decimal expansions, and so are never fully determinate objects. A function from a domain of such entities to a collection of determinate objects can never be guaranteed to be one-one. It is thus concluded that the real numbers form a potentially infinite domain of a different kind from that of the natural numbers, but not one which could be said to have a higher cardinality.

Capreolus, Johannes (*c*.1380-1444)

Thomist philosopher and theologian, Capreolus composed a lengthy commentary on Aquinas' work on Peter Lombard's Sentences, *known as Defensiones theologiae divi Thomae Aquinatis (Defences of the Theology of Thomas Aquinas) (first printed in 1483-4). He sought to refute the criticisms of Thomism by competing scholastic traditions during the fourteenth century. The Thomistic school was so impressed with Capreolus' achievement that it came to refer to him as* Princeps Thomistarum *(leader of the Thomists). Twentieth-century Thomists have, generally, considered him more faithful to the teachings of Aquinas than later commentators such as Cajetan. His philosophical opinions which have received most attention concern analogy, the formal ontological constituent of the person and the individuation of material substances.*

Capreolus was born in Rodez, France, around 1380 and entered the Dominican Order there. In 1407 he was assigned to the University of Paris as bachelor of the *Sentences*. He was licensed to graduate as master of theology in 1411. He subsequently taught in Dominican convents in Toulouse and Rodez. He died in Rodez on 6 April 1444.

Capreolus' reflections on analogy appear in his attack on Duns Scotus' affirmation that the concept of being is predicated univocally of God and creatures (see Duns Scotus, J. §5). He does not present a systematic theory of analogy but solely a tentative clarification of the analogy of being (see Language, Renaissance philosophy of §4).

He accepts as paradigmatic Aquinas' threefold division of analogy (see Aquinas §9). It is the third part of the division that deals with the analogy between God and creatures: the analogical concept is predicated of things which have neither a proper notion nor their manner of being in common. To explain it, he uses the distinction between the formal and the objective concept thereafter adopted almost unanimously by the Thomistic school. The formal concept is the subjective, mental representation of a common nature produced by the possible intellect after it has been actualized by an impressed intelligible species abstracted by the agent intellect from a phantasm. The objective concept is the extramental common nature considered precisely in so far as it is the object of an act of understanding.

Duns Scotus would be correct, Capreolus claims, if he held that it is the formal concept of being that is predicated univocally of God and creatures. But Duns Scotus errs by asserting this of the objective concept of being which, in fact, is predicated analogically. An objective concept is analogical when it is predicated of several things 'by attribution'. Predication by attribution is the essential characteristic of analogical predication. By this Capreolus means a predication which reflects an order of priority and posteriority founded on real relations of causality, dependence or correlativity.

Capreolus proposes a theory of the formal, ontological constituent of the person. The person is a complete being in the intellectual order. Being is predicated primarily of first or individual substances. The person is, then, an individual substance in the intellectual order. An individual substance does not derive the characteristics of its completeness (autonomy and incommunicability) so much from its essence as from its act of existence. The act of existence, which is the formal constituent not only of the essence but of the substance as such, must also be the formal constituent of the person. Accordingly, ontological personhood is to be distinguished from the instantiated intellectual nature in the same manner as the act of existence is distinguished from essence. Capreolus' theory has no place for the explanation of ontological personhood in terms of an added modality, as would be proposed by later commentators such as Cajetan, and is founded directly on Aquinas' real distinction between essence and the act of existence.

The problem of the individuation of material substances concerns the possibility of their solely numerical distinction and multiplication within a single species. The classic Thomistic answer is that such distinction and multiplication presupposes division, which in turn presupposes divisibility. Divisibility itself presupposes quantification, which in turn presupposes materiality. Individuation is to be explained, therefore, in terms of matter as marked (*signata*) by quantity. Divergences arise over the precise meaning of this marking (*signatio*). Capreolus' opinion is that it means the actual quantification of corporeal matter and not merely a capacity for, or some other kind of relation to, quantification on the part of prime matter. Later commentators, such as Cajetan,

preferred one of these alternative interpretations and accused Capreolus of absurdly reducing the principle of individuation to an accident of material substances. But, for Capreolus, the principle of individuation is not this actual quantification but corporeal matter in so far as it is actually quantified.

Capreolus' work was very popular during the century which followed its first printing in 1483-4. This was due to the wide range of authors against whom he argued: Duns Scotus, William of Ockham, Peter Aureol, Gregory of Rimini, Durandus of St Pourçain, Hervaeus Natalis and many others. He seems to have relied, though, on the expositions of their views which he found in Aureol's commentary on the *Sentences*. Particularly important for the diffusion of his doctrines were the many digests, concordances and indices made at this time by such authors as Paul Soncinas, Sylvester Prierias and Matthias Aquarius. Since then his thought has been generally neglected with the exception of the few, especially controversial, issues mentioned above.

Cardano, Girolamo (1501-76)

The Renaissance Italian Girolamo Cardano is famous for his colourful personality, as well as for his work in medicine and mathematics, and indeed in almost all the arts and sciences. He was an eclectic philosopher, and one of the founders of the so-called new philosophy of nature developed in the sixteenth century. He used both the Aristotelian and the Neoplatonic traditions as starting points, and following the medical paradigm of organic being, he transformed the traditional Aristotelian universe into an animated universe in which, thanks to their organic functional order, all individual parts strive towards the conservation both of themselves and of the whole universe. As a result, they can be subjected to a functional analysis. In his more casual writings on moral philosophy, Cardano showed his orientation to be basically Stoic.

1 Life

Girolamo Cardano (also known as Gerolamo Cardano or Hieronymus Cardanus) was the illegitimate son of a Milanese lawyer, and grew up in very difficult conditions. He studied medicine and mathematics at Pavia (1518-23) and Padua (1524-6). He received his MA and his MD from Padua, and practised as a physician, first at Saccolongo near Padua (1526-32) and then, after some controversy with his local colleagues, in Milan (1539-43). In 1552 he successfully cured John Hamilton, Bishop of Edinburgh, of asthma, and for the rest of his life enjoyed his reputation as a famous physician. Cardano started teaching mathematics at Milan in 1534, and medicine in Pavia from 1543. After the execution of his son for murder Cardano left Pavia, and he taught at Bologna from 1562. He was arrested by the Inquisition in 1570 for reasons which remain unknown, and was released on condition that he abandon teaching and publishing. Cardano then went to Rome where he received an annuity from the Pope, and continued to practise as a physician. He also worked on his frank and self-revelatory autobiography up to the time of his death on 21 September 1576, a date that he had himself foretold from his horoscope.

Cardano was a prolific writer. In his will of 1571 he mentions 103 printed works and forty-three in manuscript form. In his autobiography *De vita propria liber (The Book of My Life)* he counts fifty-five works in print and forty-five in manuscript. His *Opera omnia* contains seventy-one works published during his lifetime and forty other works. His style is inelegant, his Latin faulty, his argumentation often incomplete and disorganized, and as a result his writings are often unclear and difficult to understand. This does not, however, mean that he had nothing of value to say.

2 Non-philosophical achievements

Cardano was extremely creative, and a torchbearer for scientific progress. He took pride in being called *vir inventionum* (the man of inventions) and opened up new perspectives on every field he entered. In medicine, Cardano claimed to have made 40,000 important and 200,000 less important inventions. In mathematics, he taught a method for solving cubic equations, though the mathematician Tartaglia accused him of plagiarism, and he made the first moves towards the theory of probability. In mechanics 'Cardano's suspension' is still regarded as a success. He wrote on music and on dreams, believed in demons, and was regarded as a reliable astrologer, who even cast the horoscope of Jesus Christ.

3 Metaphysics

Cardano claimed that Plotinus and Aristotle were his main inspiration in philosophy, and though he argued explicitly against Aristotle, his theory is implicitly based on the Aristotelian tradition. While he was not a systematic thinker, his work rests on some basic assumptions which allow for a systematic understanding of his main philosophical teaching, and which are themselves of major philosophic interest.

His notion of unity is fundamental. It was developed in a little treatise *De uno (On the One)*, written around 1560 and published in Basle in 1562. Cardano himself recommended it as an introduction to his natural philosophy. In it he argued that everything that exists is one, so that the structure of unity is identical to the structure of reality. Analysis of a given real being, a human being for example, shows that its unity consists both in the single principle behind its various operations and in the organic structure of its corporeal basis, which guarantees that its various parts cooperate in the effort to achieve self-conservation. Thus every real being can properly be regarded as a system constituted by a certain number of organic parts that cooperate in function. Every organ, in so far as it is a

real being and therefore one, has necessarily to be such a system; and every real being, as part of a greater, more comprehensive, whole, has to function as an organ of this larger unit. As a result, reality is reduced to a system of functions, in which every individual being is at the same time an organ or subsystem of its supersystem, and the superior unit of its subsystems. This kind of ordering is also to be found in the sphere of history, which is governed by fate.

4 Physics

In Cardano's treatise *De natura (On Nature)*, written at the same time as *De uno* (though not published in his lifetime) and like *De uno* recommended as introductory reading, Cardano developed his concept of nature in accordance with his basic ontological principle of unity. The single principle which coordinates the various operations of natural beings and causes the organic order of their unity is called the soul. As a result the whole of the material world is animated, and Aristotle's distinction between organic and non-organic nature is abandoned. Different souls are systematically ordered in the same way as the different natural beings which they animate. Their principal task is to care for the self-preservation of the bodies which correspond to them, so they are endowed with whatever means of cognition are necessary for that task. They act in accordance with the principles of sympathy and antipathy. The intellectual soul, being supernatural, is one and the same for all human beings, as Averroes had held (see Ibn Rushd §3).

Bodies themselves are constituted by the heat of the heavens. This heat is the active principle that serves the soul, and operates on the passive principle's density or extension. In *De subtilitate (On Subtlety)* Cardano identifies this passive principle with prime matter (*prima materia*) which, according to Averroes, is endowed with indefinite quantity; in *De natura* the passive principle is understood as moisture. Thus Cardano reduces and transforms Aristotle's doctrine of the four primary qualities (hot, cold, wet and dry) that constitute the four elements.

5 Epistemology

Natural beings are perceived as organic units through the senses, and it is the task of science, through a functional analysis, to transform this confused knowledge of the whole into a distinct knowledge of its parts and their ordering in a system. Thanks to the infinity of the universe's various parts, human beings will never be able to analyse and thereby know the whole of the universe. Moreover, thanks to the infinite subtlety of the smallest parts, which escape the senses, these too will necessarily remain unknown. As a result, as Cardano points out in *De arcanis aeternitatis (On the Secrets of Eternity)*, it is the greatest and indeed most disastrous error to claim that humans can achieve absolute knowledge. Nonetheless, there are organic units which are not disproportionate to the human intellect in terms of the variety of their parts and the subtlety of their structure, and these can be the subject of scientific analysis. Moreover, they enjoy ontological autonomy as far as their place in the system's order is concerned, and hence can be known, if not according to their essence, at least according to their functional structure. It is this knowledge of the functional structure of natural beings that, if soundly based, can be used in technical or mechanical inventions.

6 Main works in natural philosophy

It is in the context of the principles discussed in §§3-5 that Cardano's main works in natural philosophy, the twenty-one books of *De subtilitate* from 1550, and their supplement, the seventeen books of *De rerum varietate (On the Variety of Beings)* written in 1557, should be read. While their titles refer to the aspects of reality that constitute the limits of human knowledge, the books themselves offer a comprehensive description of the whole universe. Following the order of the traditional Aristotelian doctrine of nature, they start with the principles of physics and descend to the elements, the mixed bodies, metals and stones, plants, animals, and human beings; then they ascend again from the psychological faculties of the senses, the will and the intellect, through their effects, the arts and sciences, to the demons, first substances, and God himself. This apparently Aristotelian order led Julius Caesar Scaliger to criticize Cardano from the perspective of orthodox Aristotelianism; the fact that, for no apparent reason, Cardano mixed the theoretical with the practical and the general with the particular does make it difficult to follow his arguments. However, contrary to Scaliger's belief, Cardano did not intend to teach Aristotelian natural philosophy. Nor did he, contrary to modern expectations, intend to display a comprehensive and consistent theory of nature. His way of writing and arguing must be understood in the light of his denial of the possibility of absolute truth and his doubts about the fruitfulness of merely theoretical argumentation. He was content to offer a

functional analysis of individual natural beings through sense perception, and to validate his analysis through technical application.

Carlyle, Thomas (1795-1881)

Although widely influential as a historian, moralist and social critic, Carlyle has no real claim to be considered a philosopher. He does have some importance as one of the transmitters of the ideas of the German Idealists, such as Kant and Fichte, to Britain, and as one of the chief British spokesmen for the Romantic exaltation of the imagination above the understanding; but his grasp of philosophical issues is vague. His later writings are dominated by the idea, derived from his childhood Calvinism, of a divine justice working in history through the medium of great men ('heroes') who are its conscious or unconscious instruments.

Carlyle was born in Ecclefechan, Scotland, the eldest son of James Carlyle, a farmer and stonemason, and his wife Margaret. Educated at Annan Academy and Edinburgh University, he eked out a meagre living by private tutoring and journalism until leaving Scotland and moving to London in 1834. His first major work, *Sartor Resartus*, was published in 1833: the most significant of his later writings were *The French Revolution* (1837), *Past and Present* (1843), *Letters and Speeches of Oliver Cromwell* (1845) and *The History of Frederick the Great* (1858-65).

Carlyle is important as a literary figure, a moralist, a historian and a social critic, but has little serious claim to be considered a philosopher, though he was sometimes regarded as such by his contemporaries. His chief interest in this regard is as one of the transmitters of German Idealism to Britain in the 1820s. The tradition of Scottish Calvinism in which he had been brought up had been shaken by his encounter with the ideas of the Enlightenment at Edinburgh University, and he found in the German Idealist tradition a resolution of the problems this caused him. His enthusiasm for this tradition was expressed in a series of review articles from the 1820s which first brought his name before the public - notably on the 'State of German Literature' (1827) and 'Novalis' (1829) (see also 'Voltaire' (1829) and 'Diderot' (1833) for his repudiation of the rationalism of the Enlightenment).

In these articles he refers enthusiastically to the work of Fichte and Kant, insisting particularly on the characteristic German Idealist distinction between *Vernunft* ('Reason') and *Verstand* ('Understanding'), and exalting 'Reason', understood as comprehending feeling and imagination, at the expense of the empirical and logical 'Understanding'. However, Carlyle was much more interested in the literature of the German renaissance than in its philosophy (it is significant that he never wrote specifically on Kant or Fichte) - in particular, he idolized Goethe - and his understanding of the strictly philosophical issues at stake was limited. He is accordingly less important as a transmitter of German Idealist philosophy than Coleridge - whom, in his later years, Carlyle knew, but whom he revealingly rejected, lacking patience for the fineness of Coleridge's distinctions and what he saw as his intellectual indecisiveness.

The fullest expression of Carlyle's philosophical position at this stage of his life is found in *Sartor Resartus*, the only one of his books which makes any claim to philosophical status. Its form - an examination of the life and writings of an imaginary 'Professor Teufelsdrockh' - is maverick, but the influence of German Idealism is manifest. The title ('The Tailor Re-Tailored') refers to Teufelsdrockh's supposed 'Philosophy of Clothes', in which clothes become the metaphor for the material world which simultaneously expresses and conceals the transcendental world within. This material world is conditioned by the categories of time and space, but these are themselves illusions, concealing the realities of eternity and infinity. These realities cannot be apprehended rationally, but only intuitively by the 'deep infinite faculties' of 'Fantasy and Heart'. In this plea for the imaginative faculties (anticipated in two important earlier essays, 'Signs of the Times' (1829) and 'Characteristics' (1831)) can be discerned one of the major manifestos of Romanticism, then at its height as a literary movement. The inspired artist - the ideal is Goethe - is seen by Carlyle as the hero who alone can discern and make clear to his readers the spiritual realities which underlie their material garments (the origin of the idea of 'hero worship', which becomes increasingly dominant in Carlyle's later work).

However, after *Sartor* Carlyle's concerns turned increasingly away from philosophy towards history and social criticism (the categories to which all his later writings listed above belong). His friends included both John Stuart Mill and Ralph Waldo Emerson; but he passionately rejected both Mill's utilitarianism (which he characterized as 'Pig Philosophy') and his political liberalism, and showed little more enthusiasm for Emerson's transcendentalism. In his later writings, of which *The French Revolution* is the most remarkable, the influence of his earlier Calvinist heritage becomes increasingly apparent, in his insistence that the events of history can be properly understood only

when they are seen as the workings of a vaguely-conceived divine providence which ensures the final triumph of justice in all the processes of history. This providence is purely moral - Carlyle does not see history as progressive (and seems not to have read Hegel). This sense of a providence working through history forms an approximate parallel to his earlier insistence on a transcendental order which can only be discerned through the material, but it is certainly not identical with it: it is moreover weakened by Carlyle's inability to provide any firm independent criterion of justice other than success, so that the argument becomes circular, and his biographies of Cromwell and Frederick the Great, especially the latter, are hard to distinguish from encomiums of *Realpolitik*.

A lack of close argument and clear definition pervades all Carlyle's work, and must undermine any serious claim for him as a philosopher. This very incoherence, however, enabled him to give forceful and sometimes memorable expression to a wide range of antirationalist and anti-empiricist attitudes characteristic of the Romantic reaction against the Enlightenment - a range that also includes a recurrent insistence on moral authenticity that sometimes anticipates some existentialist positions. His real significance, however, lies in other fields.

Carmichael, Gershom (1672-1729)

Gershom Carmichael was a teacher and writer of pivotal importance for the Scottish Enlightenment of the eighteenth century. He was the first Professor of Moral Philosophy at the University of Glasgow, predecessor of Francis Hutcheson, Adam Smith and Thomas Reid. Carmichael introduced the natural law tradition of Grotius, Pufendorf and Locke to the moral philosophy courses he taught at the University of Glasgow (1694-1729). His commentaries on Samuel Pufendorf's work on the duty of man and citizen (1718 and 1724) made his teaching available to a wider readership in Great Britain and in Europe. He also composed an introduction to logic, Breviuscula Introductio ad Logicam, (1720 and 1722) and a brief system of natural theology, Synopsis Theologiae Naturalis (1729).

Gershom Carmichael began his teaching career at St Andrews University in 1693; he was appointed to the University of Glasgow in 1694, and became the first Professor of Moral Philosophy at that university in 1727. His moral philosophy is remarkable particularly for the manner in which he justified the natural rights of individuals. Those rights included self-defence, property and the natural right to services contracted for with others. He also argued that slavery is incompatible with the rights of men and citizens, and that subjects have a right to resist rulers who exceed the limits of their powers. His arguments for natural rights derived from his understanding of the divine or natural law that lasting happiness or beatitude may be found only in reverence for God. One may signify reverence or veneration directly; but reverence for God may also be signified indirectly, by reverence or respect for his creatures, and specifically by respect for mankind. The most evident manner in which the latter may be signified is by acknowledging the natural rights of all human beings. By such acknowledgement one signifies observance of the divine or natural law, and one finds, in such observance, beatitude or lasting happiness.

Carmichael's theory that rights derive from a universal longing for beatitude was consistent with the Reformed scholastic theology that was taught in Scottish universities in the late seventeenth and early eighteenth centuries. His theory of moral motivation presented a problem, however, for his successors. Was it possible for an action or a character to be moral or right or good if it was inspired by some motive other than veneration of God? Hutcheson, Smith and Reid found in benevolence, in sympathy with others and in conscience, moral inspiration which they judged to be more consistent with experience than Carmichael's moral psychology. But, in their disagreements with Carmichael and with one another, they generated those fruitful speculations concerning the moral life of mankind that we have come to call the Scottish Enlightenment (see Enlightenment, Scottish). Carmichael's importance as a moral philosopher turns, then, not only upon his distinctive contribution to the natural rights tradition of Grotius, Pufendorf and Locke; nor upon his redirection of Reformed or Presbyterian scholastic ethics to speculation on the divine inspiration for human rights and obligations; it was, above all, perhaps the manner in which he helped to shape the agenda of moral philosophy in eighteenth-century Scotland that makes him a figure worthy of attention in the history of philosophy.

Carnap, Rudolf (1891-1970)

Carnap was one of the most significant philosophers of the twentieth century, and made important contributions to logic, philosophy of science, semantics, modal theory and probability. Viewed as an enfant terrible *when he achieved fame in the Vienna Circle in the 1930s, Carnap is more accurately seen as one who held together its widely varying viewpoints as a coherent movement. In the 1930s he developed a daring pragmatic conventionalism according to which many traditional philosophical disputes are viewed as the expression of different linguistic frameworks, not genuine disagreements. This distinction between a language (framework) and what can be said within it was central to Carnap's philosophy, reconciling the apparently a priori domains such as logic and mathematics with a thoroughgoing empiricism: basic logical and mathematical commitments partially constitute the choice of language. There is no uniquely correct choice among alternative logics or foundations for mathematics; it is a question of practical expedience, not truth. Thereafter, the logic and mathematics may be taken as true in virtue of that language. The remaining substantive questions, those not settled by the language alone, should be addressed only by empirical means. There is no other source of news. Beyond pure logic and mathematics, Carnap's approach recognized within the sciences commitments aptly called a priori - those not tested straightforwardly by observable evidence, but, rather, presupposed in the gathering and manipulation of evidence. This a priori, too, is relativized to a framework and thus comports well with empiricism. The appropriate attitude towards alternative frameworks would be tolerance, and the appropriate mode of philosophizing the patient task of explicating and working out in detail the consequences of adopting this or that framework. While Carnap worked at this tirelessly and remained tolerant of alternative frameworks, his tolerance was not much imitated nor were his principles well understood and adopted. By the time of his death, philosophers were widely rejecting what they saw as logical empiricism, though often both their arguments and the views offered as improvements had been pioneered by Carnap and his associates. By his centenary, however, there emerged a new and fuller understanding of his ideas and of their importance for twentieth-century philosophy.*

1 *Aufbau*

The last of twelve children, Carnap was born in Ronsdorf, a small village now incorporated into Wuppertal, Germany. His father, who died when Carnap was seven, was born poor but became a prosperous factory owner. Carnap's mother (née Dörpfeld) was from a more academic family. Her father was a well-known educational reformer, and her oldest brother, Wilhelm, was a renowned archaeologist who, along with Heinrich Schliemann, discovered the remains of Troy. Carnap's undergraduate studies at Freiburg and Jena were in physics, mathematics and philosophy, and Gottlob Frege was among his teachers at Jena. While serving in the First World War he became familiar with relativity theory, and in 1919 with Whitehead and Russell's *Principia Mathematica* (1910-13) (see Russell, B.; Whitehead, A.N.). His doctoral dissertation in Jena, *Der Raum: Ein Beitrag zur Wissenschaftslehre (Space: A Contribution to the Theory of Science)* (1922), combined his undergraduate interests (as his career was to do). Anticipating his later principle of tolerance, this work argues that apparent disagreements among physicists, geometers and philosophers arise from the fact that they articulate wholly different concepts: physical, mathematical and visual space. The section on the last has a character reminiscent of Kant which he later repudiated, though some Kantian features continued to shape his work (see Kant, I. §5). This was especially true in the 1920s, during which he published papers on space, time and concept formation, as well as *Der logische Aufbau der Welt (The Logical Structure of the World)* (1928) and a textbook in mathematical logic. In 1923 he became friends with Hans Reichenbach, who was then also a Neo-Kantian. In 1926, at the invitation of Moritz Schlick, Carnap became a *Privatdozent* at the University of Vienna, where an early version of the *Aufbau* was his *Habilitationsschrift*.

The *Aufbau* established his international reputation. Taken at face value, it is a system of definitions. He presents the first stages, constituting the objects of one's own experience, with great formal rigour, and the later stages carefully but in outline form. Finally he discusses the philosophic consequences of such a system. The *Aufbau* assumes a single undefined concept, partial, remembered similarity, ranging over time-points in the stream of experience. On that basis Carnap sets out to define (or constitute) every other concept and object in the whole system of science. The resulting system is constitution theory. Similarity is used to define properties, for every object having a given property must be similar to every other object having the same property. The partialness of

the basic relation is exploited to order properties into families, and the 'rememberedness' of the basic relation is used to achieve a temporal ordering of experiences. Later, physical objects were to be defined, then other minds, and finally cultural objects.

Though plainly inspired by Mach and Russell, just what Carnap hoped to achieve by the *Aufbau* is unclear. One interpretation holds that the enterprise is straightforward ontological reduction to sensory phenomena, but Carnap seems not to have meant 'reduction' as understood by English-speaking philosophers. He shows complete indifference to such ontological issues and draws from his constitution theory a moral of metaphysical neutrality. Moreover, he says that a different basic relation or even a physical basis would have served his purposes equally well, and he calls his definitions 'epistemic analyses', not ontological ones. Carnap intends not to reproduce the actual processes of concept formation, but rather to give a rational reconstruction of them. This, and the fact that he starts, like Descartes, with one's own experiences and tries to range the various concepts and claims in a (rational) epistemic order, has suggested to some that Carnap is trying to justify the claims of science by providing them with a philosophical foundation. Against this, Carnap seems to take the results of contemporary science completely for granted; he claims no synonymy between defined and defining concepts, but only extensional equivalence in ways that presuppose rather than defend the science in question. This, surely, would undermine such a foundational programme. He denies that philosophers can make the sciences more certain. One intriguing interpretation developed by Michael Friedman (1992) among others, is that Carnap was undertaking the task of showing that intersubjectively applicable concepts can be developed, even though we each begin with our own subjective experience (see Foundationalism).

Whatever the interpretation, are even those portions of the system that are fully worked out satisfactory? Notably, Nelson Goodman (1951) has argued that though each member of a 'property class' is indeed similar to each other, the class may fail to pick out a property because its members are similar in different respects. The seriousness of this problem will depend on the remedy and on how it serves Carnap's purposes.

2 Vienna

Moritz Schlick, named professor of inductive sciences in 1922, drew Carnap, Otto Neurath, Hans Hahn and others as members of a new Vienna Circle, active in discussing scientific methodology (see Vienna Circle). With such figures as Wittgenstein, Popper and Gödel in the neighbourhood, Vienna in the late 1920s and early 1930s was lively indeed. The Circle combined serious interests in empirical science, its methods, and their logical analysis. Schlick had a doctorate in physics (under Max Planck); Carnap's speciality was logic, foundations of mathematics, and physics; Neurath was a sociologist, Hahn a mathematician, and others included economists and psychologists. The interest in scientific methodology was inspired largely by the writings of scientists: Mach, Duhem, Poincaré, Hilbert and Einstein. Members were uninterested or openly hostile to Cartesian methodological discussions, and they knew little of the British empirical philosophers, such as Berkeley, Hume and Mill. Russell was no ordinary British empiricist, and Viennese interest in him was very selective.

The nineteenth and early twentieth centuries witnessed major scientific and mathematical developments with implications for Kantian philosophy. First came non-Euclidean geometries which encouraged a distinction between physical geometry, which was synthetic, and mathematical geometry, which was a priori (see Geometry, philosophical issues in). Hilbert dealt with the latter by deploying highly formal analyses and a theory of implicit definition. With the advent of Einstein's relativity theory, non-Euclidean structures invaded even physical geometry (see Relativity theory, philosophical significance of). And Schlick was among the first philosophers to discuss and embrace the new physics. These developments did not refute the Kantians, but threw them into disarray. Rather than giving no answer, they had too many. Other nineteenth-century mathematical developments diminished the role for Kantian intuition. Finally, Frege and Russell developed modern symbolic logic and succeeded in deriving all of mathematics from it (and set theory) (see Logicism). In this they were inspired by the fear of both psychologism and empiricism in mathematics. Technically, their achievement only transferred mathematics from one Kantian classification (synthetic) to another (analytic) without saying much about what the analytic is. Russell himself seemed to prefer some sort of Platonistic account, and Frege preferred silence. Nevertheless, these achievements revealed how meagre and inadequate were Kant's discussions of the analysis of concepts. Both the geometric and arithmetic developments undermined the foundations of Kant's account of the synthetic a priori and showed the need for much more careful and systematic formal analyses. On neither front did

the nineteenth-century empiricist tradition seem to have much to say that was useful.

Members of the Circle were empiricists, but of what sort? Schlick and Carnap were initially Neo-Kantian empiricists, and Neurath seems to have come from an Aristotelian empiricist tradition (see Aristotle §9). Clearly they were not trying to reprise phenomenalism nor to substitute philosophic arguments and speculation for scientific evidence and methods. Perhaps what held them together was their conviction that science is not subservient to philosophy. Philosophers have no special source of news, and when they try to go beyond science or neglect it altogether they simply talk rubbish. There was a long tradition of calling this habit metaphysics, and deploring it (even, and perhaps especially, within the Kantian tradition). The result was the famous verification principle: that meaning is the mode of verification (or better, of confirmation) and that no claim is meaningful unless it can be confirmed or disconfirmed, either by logical (analytic) or empirical means. The verification principle itself is not an empirical claim, sociological or otherwise, about what claims people find meaningful. It is rather a proposal about how we should structure our language. If such a proposal were adopted, the principle would be an analytic claim in the metalanguage. In neither case would the verification principle be self-defeating (see Meaning and verification).

The Vienna Circle embraced a variety of evolving views. Among the most important cleavages was that between the ‘right wing’, led by Schlick and Frederick Waissmann and influenced strongly by Wittgenstein, and the ‘left wing’, led by Carnap and Neurath. One plank in the platform of the left was to liberalize the criterion of meaningfulness; a second was antifoundationalism. They argued that a physicalist language was sufficient for and conducive to the purposes of science, including its most basic observational evidence. They also embraced a confirmation holism and a thoroughgoing fallibilism about both observation reports and theories, and insisted that logic and mathematics were revisable (see Fallibilism). The left wing also emphasized the practical, especially the use of science as part of a programme of social reform. This practical emphasis eventuated in Carnap’s intriguing suggestion that empiricism itself was a proposal to be adopted on pragmatic grounds. Carnap’s version of the unity of science was that the language of science should be unified in having all of its concepts appropriately tied to a common, publicly testable, observational basis. Regarding the unity of the laws of science, he urged that while philosophers might have something to say about what the reduction of some laws to others might mean, we should avoid speculation and wait on experience to see whether that sort of unity really obtained. Such unity is neither foundationalist nor phenomenalist (see Logical positivism).

3 Syntax

Carnap’s most impressive undertaking of the 1930s was the development of a metalanguage that was adequate for discussing logic and the foundations of mathematics. In the process he worked out a new pragmatic and conventionalist epistemology with consequences for the character of observation and the interpretation of scientific theories. In the background were disputes among logicists, formalists and intuitionists over the foundations of mathematics, and between classicists and intuitionists over the character of logic. While Wittgenstein seemed to be saying that one could not talk about logical form, only show it, Carnap tried to develop a way of talking about logic in which its structure or form could be expressed. If the original language were suitably restricted, its structure could be described, even within that language itself, thanks to Gödel’s device of arithmetization. Other object languages could be described in this metalanguage, and still more powerful object languages could be described in distinct metalanguages. This required a choice which could be settled neither by empirical means, nor, on pain of circularity, by logical ones. The issue resembled that which had faced geometers at the end of the nineteenth century, and Carnap met the new problem as Hilbert had met the old, with a version of a theory of implicit definition. The alternative logical structures are conventions defining the terms they contain, and we should tolerate alternatives. Hence, Carnap’s famous principle of tolerance: ‘In logic there are no morals’, meaning roughly that there is no uniquely correct logic. The alternatives can be described, though not always in the language itself, and their consequences investigated and compared. Some may be more useful (more convenient, simpler, more powerful), and so a choice might be made on these grounds, but not because one of them is the right one. This is the central doctrine of *Logische Syntax der Sprache (The Logical Syntax of Language)* (1934a). The English translation included several sections containing a virtual semantics originally omitted for lack of space.

The doctrine was illustrated by presenting two languages. Language I is a coordinate language (using symbols of position rather than names of objects) and is highly restrictive, allowing, either in its formulas or in the definitions

of terms, only quantifiers that can be replaced with finite conjunctions or finite disjunctions. Carnap thought this the language preferred by intuitionists, though they never entirely agreed. Language II is classical in using unlimited quantifiers and is sufficient for expressing classical mathematics. Gödel had shown that no language this rich could be both consistent and complete in the sense that every sentence or its negation would be derivable from the axioms. Carnap's striking innovation in Language II is to develop a consequence relation much more powerful than the traditional idea of derivation, and to show that mathematics could be complete in this new sense.

Most logical discussions, including those of Languages I and II, begin with lists of grammatical categories and of terms therein, and go on to specify what shall count as sentences, derivations, proofs and so on. But this provides no general terms which are useful for the discussion of other languages. Part IV of *Logical Syntax* provides definitions of grammatical categories and everything else to discuss and compare alternative languages, including translation. This is done with just two primitive terms: 'is a sentence' and 'is a direct consequence of'. The definitions do not always work, but, even so, are an amazing achievement. He tried to distinguish the logical from the descriptive vocabulary and specifically allowed rules of inference which were not wholly logical in character. He also developed a general notion of analyticity, which he later modified. This discussion was essentially of a sort later called semantical, and in limited ways surpassed even Tarski's concurrent discussions (see Semantics; Tarski, A.). Carnap denied only that a syntactical discussion of truth was possible and, hence, that a truth theory was part of logic. Unsurprisingly, therefore, he soon changed his mind and embraced semantics. He and Tarski then viewed the new truth theory as lying within what Carnap meant by 'syntax'.

Characteristically, the last part of the book is devoted to the philosophical significance of the rest. Having discussed standards of translation, Carnap notes that many claims which seem to be about extra-linguistic objects can be translated into sentences about only words, sentences or other linguistic items. Before such translation, these sentences are said to be in material mode; after, in formal mode. Speaking in the material mode is fine, but it can disguise the implicit relativization of such claims to specific languages. This fosters the illusion that there is a uniquely correct answer to the unrelativized questions, and hence that there are genuine disagreements about it. Where we might be misled, we would do better to speak in the formal mode.

Carnap generalizes this observation. *All* philosophic questions, properly understood, are really about language. The traditional practice of philosophy is a mixture of empirical (psychological and sociological) questions with ones about the logical structure of language. This is not bad, but the concoction allowed metaphysicians, who certainly did not think their enterprise an empirical one, to think they were talking about extra-linguistic objects to which they somehow had a transcendent non-empirical access. To this Carnap says: Humbug! When the empirical component is assigned to science, where it belongs, only the logic of the language of science remains. Properly speaking, this is what philosophy is and all that it is. Such logic of science Carnap calls 'syntax', but his sense is far broader than that of later generations. Specifically, Carnap supposed that the grammatical form of observation sentences could be determined or at least marked syntactically and also that the question of which sentences implied which others could likewise be answered syntactically. Such an account of the structure of observation and inference would be the non-psychological core of a proper philosophic epistemology; it would be the logical structure of science.

This syntax project had two noteworthy dividends for philosophy of science. The first was 'Über Protokollsätze' ('On Protocol Sentences') (1932a), Carnap's first presentation of the new conventionalist/pragmatist view. The Circle was debating the character of observational evidence. Is it certain? In cases of conflict with theory might the observational claims give way? Can or must it be about physical objects as opposed to private sensory states? Carnap says that the alternatives are not claims in conflict but rather the expression of different languages among which we must pragmatically choose. His own recommendation was a physicalist observational language (one far less regimented than Neurath's) in which the individual protocols could be revised in the light of other evidence and theory.

The second major dividend was the paper 'Testability and Meaning' (1936-7). Having decided that observation and implication relations were at the heart of logical analysis, Carnap saw that such analysis need not require that all empirically significant terms be explicitly definable in the observation language. Partial definitions would do if they reveal the implication relations between a given term and other terms antecedently established as empirically meaningful. These partial definitions Carnap calls reduction sentences, and they provide more adequately for

disposition terms even if observational conditions which are jointly necessary and sufficient cannot be given. The reduction does not allow the elimination of the partially defined term. That this fact does not bother Carnap shows that the point of reduction in his sense is not economy, either in ontology or in conceptual resources. More likely, the point is a logical one, or epistemic in the structural sense just noted. This analysis of scientific terms also resulted in Carnap's denial in 'Wahrheit und Bewährung' ('Truth and Confirmation') (1936) that strict translations of claims from one language into another were always possible. Elsewhere in 'Testability and Meaning' he denies a sharp observational-theoretical distinction and suggests that it matters little where or how it is made more exact. Finally, he says that the varieties of empiricism themselves are conventions, though ones he strongly endorses, and he prefers the most liberal of those considered (see Observation; Reduction, problems of).

4 America

While Carnap is strongly associated with Vienna, he resided there for just five years. In 1931 he accepted a professorship in natural philosophy at the German University in Prague, though he still frequently attended Circle meetings. With the rise of Nazism, he moved in 1935 to the University of Chicago. This move coincided with his turn to explicitly semantical concerns, and the significance of his syntax project was largely lost on his new American audience. In Chicago an encyclopedia for unified science finally found a home, with the help of Charles Morris.

A preliminary result of the semantical work was *Foundations of Logic and Mathematics* (1939) with fuller accounts in *Introduction to Semantics* (1942) and *Formalization of Logic* (1943). These works broaden the previous syntax programme, which now clarifies meaning, rather than forbidding talk of it. They deal only with extensional languages, but in *Meaning and Necessity* (1947) Carnap provided a new semantical method of intension and extension in place of the older method of the name relation. This allowed the treatment of intensional languages (such as for modality) involving even quantification. Modality was taken as an essentially linguistic affair, rather than in metaphysically more profligate ways. He added a distinction between two senses of synonymy: a weak sense amounting to mutual entailment, and a stronger sense, called intensional isomorphism, which holds whenever expressions are built up in the same way out of weakly synonymous parts. Hence, any pair of arithmetic truths will be (weakly) synonymous but will not in general be intensionally isomorphic (see Intensional logics).

5 Probability

A project to develop a theory of logical probability or degree of confirmation dominated the last three decades of Carnap's life. This notion of probability is essentially a generalization of deductive or logical implication, and, as such, a relation between sentences or propositions. Elementary statements of such probabilities are analytic or contradictory (just as claims of logical entailment would be). There is another concept of probability, the statistical frequency notion developed by Carnap's friends Richard von Mises and Hans Reichenbach, according to which the probabilities are factual ratios of classes of events. For Carnap, these two probability notions are not rivals, not even rival explications of the same ordinary concept. They are explications of two entirely different notions, both useful and both exhibiting the mathematical structure required to merit the term 'probability' (see Probability, interpretation of).

Carnap developed this notion most extensively in *Logical Foundations of Probability* (1950a), which discusses what it is to explicate an ordinary concept and proceeds to provide the required analysis. Some results were initially implausible, such as that the degree of confirmation for any scientific law on any evidence is zero. This is mitigated, however, by the result that the instances of such a law need not have zero confirmation values. Kemeny and Bar-Hillel showed independently that Carnap's formulations exclude primitive predicates (such as disposition terms) having meaning relations to other primitive terms. Kemeny proposed a solution which Carnap adopted in 'Meaning Postulates' (1952), but still the account applied to a restricted range of languages, and Carnap's later years were devoted to broadening the theory's range and adequacy. Much of this new work appeared posthumously (see Confirmation theory).

Throughout the 1940s Carnap happily spoke of abstracta, such as properties and propositions. This sparked fears of incompatibility with empiricism, and so, in 'Empiricism, Semantics, and Ontology' (1950b), Carnap argued persuasively that this fear was unfounded. The paper reaffirmed his longstanding linguistic conventionalism, now

formulated in terms of a distinction between external and internal questions of existence. In the former, what is at issue is the adoption of a conceptual framework or language. There is no question of truth or falsity here, only of the utility of a way of speech. Once a framework has been adopted, genuine questions can be asked, but the answers are either factual (settled by empirical means) or logical. In neither case is there any deep metaphysical realism or any threat to empiricism.

While the issue was raised privately much earlier, in 1951 W.V. Quine (§8) launched a public attack on the intelligibility of Carnap's notion of analyticity (or truth in virtue of meaning). Quine's view came to be very influential, though not universal. Whatever the merits of the case, Quine came to accept a notion of analyticity that applied to what had been the central examples under debate, namely, elementary logic and the so-called truths of essential predication (for example, 'All bachelors are unmarried'). This did not entirely resolve all of the issues, but it was unclear just how much any unresolvable disagreements should affect the evaluation of Carnap's philosophy (see Analyticity).

From the early 1950s until its appearance in 1964 Carnap worked on the massive *The Philosophy of Rudolf Carnap*. It included an intellectual autobiography, a then-complete bibliography, and twenty-six critical essays with Carnap's extensive replies covering every aspect of his work.

In 1956 Carnap moved to UCLA (after two years at the Institute for Advanced Study in Princeton) to fill the post left vacant by Reichenbach's death. He continued to work on probability and confirmation, and also resumed work on topics which were more explicitly part of general philosophy of science. In 'The Methodological Character of Theoretical Concepts' (1956) he ventured a sophisticated criterion of empirical significance, and in other papers he advanced an account of analyticity for theoretical concepts. The last book published in his lifetime was *Philosophical Foundations of Physics: An Introduction to the Philosophy of Science* (1966), which was essentially a reworked transcript of a course, and reissued under its less formidable subtitle a few years later. It contains wonderfully accessible treatments of quantitative concepts and measurement, non-Euclidean geometry, relativity and a variety of other issues, such as determinism and scientific realism.

Carnap left a legacy of clarity of thought, philosophic achievement and personal kindness that has rarely been equalled. After a period of eclipse, his work has been partially 'rediscovered', and it seems likely to inform and inspire succeeding generations of philosophers much as it had done throughout the middle third of the twentieth century.

Carneades (214-129 BC)

The Greek philosopher Carneades was head of the Academy from 167 to 137 BC. Born in North Africa he migrated to Athens, where he studied logic with the Stoic Diogenes of Babylon; but he was soon seduced by the Academy, to which his allegiance was thereafter lifelong. He was a celebrated figure; and in 155 BC he was sent by Athens to Rome as a political ambassador, where he astounded the youth by his rhetorical powers and outraged their elders by his arguments against justice.

*Under Carneades' direction the Academy remained sceptical. But he enlarged the sceptical armoury - in particular, he deployed sorites arguments against various dogmatic positions. He also broadened the target of sceptical attack: thus he showed an especial interest in ethics, where his 'division' of possible ethical theories served later as a standard framework for thought on the subject. But his major innovation concerned the notion of 'the plausible' (*to pithanon*). Even if we cannot determine which appearances are true and which false, we are able to distinguish the plausible from the implausible - and further to distinguish among several grades of plausibility. It is disputed - and it was disputed among his immediate followers - how, if at all, Carneades' remarks on the plausible are to be reconciled with his scepticism.*

1 Life

Carneades' life is ill documented. He was born in 214 BC at Cyrene in North Africa. He moved to Athens where he studied logic with the Stoic Diogenes of Babylon and no doubt also listened to the other leading philosophers of the day. He gravitated to the Academy (see Academy), which was still following the sceptical path laid down by Arcesilaus, and in 167 BC he was chosen as scholarch. The school flourished under his leadership: later authors deemed that he had opened a new phase in its history. Blindness and miserable health obliged him to resign his position in 137; but he continued to philosophize vigorously until his death in 129. And when he died there was an eclipse of the moon.

He was a loud man, and admired even by his opponents for his powerful and persuasive style of argument: he had the irresistible force of a mighty river, the subtlety and resilience of a hunted beast. He lost no argument and left no hearer unmoved. When in 155 BC the Athenians petitioned the Roman Senate for the remission of a fine, they sent three philosophers as ambassadors - Diogenes the Stoic, Critolaus the Peripatetic, and Carneades. At Rome the three men displayed their professional talents to an enthusiastic public. Carneades revealed a particular power to charm and excite - the more so when, on successive days and with equal power, he urged the claims first of justice and then of injustice. Stern Cato hurried business through the Senate and bundled the Greeks off home before they could corrupt the Roman youth.

Like Arcesilaus - and Socrates - before him, Carneades wrote nothing. Several of his pupils took notes on his lectures and wrote memorials of his arguments; and our meagre knowledge of Carneades depends ultimately on these works - all of which are lost. Carneades was persuasive, but he was also elusive; and his pupils disagreed on how to interpret him: his successor Clitomachus, who wrote voluminously about his master, confessed that 'he could never understand what Carneades believed' (Cicero, *Academics* II 139); and Metrodorus claimed that 'everyone has misunderstood Carneades' (Philodemus, *History of the Academy* XXVI 8-10).

Also like Arcesilaus - and Socrates - before him, Carneades argued against all-comers, showing himself 'the most acute and fertile' proponent of the *elenchos* or method of refutation (Cicero, *Tusculan Disputations* V 11). He also argued 'on both sides' - notoriously during his ambassadorial visit to Rome. And he was familiar with at least the rudiments of Stoic logic, so that his arguments against the Stoics were often and deliberately expressed as instances of Stoic inference patterns (see Stoicism §11).

In addition, he had a weakness for 'soritical' arguments - arguments which proceed 'little by little' from apparently true premises to an apparently false conclusion (see Vagueness §2). Such arguments were not invented by Carneades. Moreover, they had already been used against the Stoics; for Chrysippus had tried to answer them: before he came to the difficult cases he would 'fall silent' (*hēsychazein*). Carneades thought little of this reply:

> As for falling silent, as far as I'm concerned you may snore. What good does it do you? Someone has only to wake you up and pose the same question again.

(Cicero, *Academics* II 93)

The sorites cannot be slept away (see further Stoicism §11).

Like Arcesilaus, Carneades was especially energetic in his attacks on the Stoa: he read Stoic texts assiduously, and confessed that ‘ had Chrysippus not existed, I would not have done either’ (Diogenes Laertius IV 62). But his aim extended more widely - we happen to know that he discussed some aspects of Epicureanism; and Sextus Empiricus affirms that ‘with regard to the criterion of truth, Carneades attacked not only the Stoics but all his predecessors’ (*Against the Mathematicians* VII 159). Moreover, he maintained that, on some issues at least, ‘the dispute between Stoics and Peripatetics concerned not substance but terminology’ (Cicero, *On Ends* III 41), so that an argument against the former was thereby an argument against the latter (see Antiochus §2). It should not be thought (as some have thought) that his philosophy was purely polemical and *ad hominem*.

Carneades had a particular interest in ethics, where he not only discussed philosophical matters but also composed an idiosyncratic work on consolation. He also reflected on philosophical theology, and on such related issues as divination and the doctrine of fate. But it was primarily for his epistemological attitudes that he was notorious: he argued for some version of scepticism - and at the same time he advocated a ‘criterion’, namely *to pithanon* or ‘the plausible’. This last item was - or at any rate seemed to some of his disciples to be - a profound innovation; and it was presumably ‘the plausible’ which encouraged the suggestion that Carneades had not merely continued the tradition of Arcesilaus but had instituted a New Academy.

2 Ethics

Dogmatic philosophers disagreed over the *telos* or (Latin) *summum bonum*, the goal of life or the highest good. Carneades catalogued the differing doctrines and incorporated them into a schedule - the ‘division of Carneades’ - which set out ‘not only the opinions on the highest good which have been championed by philosophers up to now but all opinions which can possibly be maintained’ (Cicero, *On Ends* V 16). The division was celebrated, but no coherent version has survived. Carneades himself urged that the *telos* is ‘the enjoyment of the goods to which nature first inclines us’ (Cicero, *Academics* II 131): it is not known how he advocated the view - which in any event he advanced only as part of an *ad hominem* argument against the Stoics.

On the two Roman speeches on justice we have a little more information. The first speech was an anthology: Carneades ‘put together everything which had been said in favour of justice’ (Lactantius, *Divine Institutions* V 14.5). On the following day he first distinguished between ‘civil’ justice and ‘natural’ justice. He then urged that civil justice makes good sense: that is to say, it is in the interest of the legislators to enforce the laws which constitute civil justice and which they have conventionally established. But civil ‘justice’ is not just at all. Natural justice, on the other hand, is just - but it is either a phantom or a folly. If the Romans, with their wealth and their conquests, ‘wish to be just, that is, to give back what is not theirs, then they must return to their cottages and live in poverty and misery’. For the community as a whole, natural justice is absurd. And for the individual too. Suppose that you are selling a house which you alone know to be riddled with dry rot: do you show the rot to a prospective purchaser? If you do not, you are prudent - and unjust. If you do, you are just - and foolish. Suppose that you have been shipwrecked and find a fellow sailor clinging weakly to a floating plank: do you dislodge him and grab the plank yourself? If you do, you are prudent - and unjust. If you do not, you are just - and dead.

The second speech, no less than the first, was a cento of familiar arguments and examples. Carneades’ originality lay not in invention but in presentation. What he himself thought of the matter, and what he intended in arguing ‘on both sides’, we cannot tell. But he produced, as Socrates had produced, perplexity and disquiet and hostility. Cato was enraged. (But the Christian Lactantius was pleased; for Carneades had unwittingly shown that pagan philosophy, ignorant of divine truth, had no understanding of the nature and the glory of justice.)

3 Theology

Carneades collected arguments against the existence of gods. Some of these mockingly followed Stoic patterns of reasoning. Thus: the gods, being living creatures, must be capable of sense perception; anything which perceives is thereby pleased or displeased; anything which may be displeased may change for the worse; anything which may change for the worse may be destroyed: therefore if there are any gods they can be destroyed. But gods cannot be destroyed. Hence there are no gods. There was also a batch of soritical arguments. Thus:

> If Zeus is a god, then Poseidon is a god; if Poseidon is a god, then Achelous is a god; if Achelous is a god, then the Nile is a god;…then streams are gods. But streams are not gods. Therefore Zeus is not a god. But if there were any gods, then Zeus would be one. Hence there are no gods.
>
> (Sextus Empiricus, *Against the Mathematicians* IX 183)

According to Cicero, ‘Carneades said these things not in order to do away with the gods - what could be less appropriate in a philosopher? - but in order to show that the Stoics explain nothing about the gods’ (*On the Nature of the Gods* III 44). Perhaps so - in any event, it would be wrong to conclude that Carneades was a convinced atheist; for if even the arguments are not *ad hominem* - *ad Stoicos* - they will surely have formed the one half of a set of arguments ‘on both sides’.

Carneades also argued against divine providence, and in particular he disputed the Stoic view that beasts exist for the benefit of mankind - what about bats and scorpions and crocodiles? And he rejected the science of divination (which the Stoics had generally applauded), urging that when a seer gets things right, the success is mere luck. Now divination, according to Carneades, presupposes causal determinism; for ‘even Apollo cannot foretell an event unless there are causes in nature which so constrain it that it is necessary for it to occur’ (Cicero, *On Fate* 32).

The Stoics, who defended divination, held that everything does depend on such naturally necessitating causes - such was their doctrine of fate (see Stoicism §20). The doctrine had been variously attacked. Carneades allowed that some of the arguments used against it were fallacious: they falsely conflated the thought that an event is causally determined with the thought that someone may have truly said in advance that it will occur. (To say truly that something will happen is not the same as to divine or foretell it.) And he produced a better argument:

> If everything comes about by antecedent causes… then necessity determines everything; if so, then nothing is in our power. Now some things are in our power. But if everything comes about by fate, then everything comes about by antecedent causes. Therefore not everything which comes about comes about by fate.
>
> (Cicero, *On Fate* 31)

The Epicureans also rejected fatalism. In doing so they introduced their celebrated theory of ‘atomic swerves’ (see Epicureanism §12): atoms may suddenly, and for no cause, change trajectory; and these swerves ensure that there may be ‘voluntary motions of the mind’ which leave some actions in our power. But Carneades criticised the Epicureans no less than the Stoics, maintaining (truly enough) that voluntary motion can be better defended than by the introduction of uncaused swerves.

4 Scepticism

> Carneades and Clitomachus and all their friends trample on the doctrines of everyone else and themselves expressly affirm that everything is inapprehensible and that a false appearance always neighbours a true one.
>
> (Hermias, *Mockery of the Pagan Philosophers* 15)

According to Carneades, we can apprehend nothing - not even (as Cicero adds) that we can apprehend nothing; for next to and indistinguishable from any true appearance there will always be found a false appearance.

Carneades fired broadsides against every philosophical attempt to provide a criterion of truth. He peppered them with bent oars and round towers and moving coastlines - with all the ‘illusions’ which have diverted later sceptics. In particular, he reflected on the reigning Stoic account of knowledge, which turned on the notion of an ‘apprehensive appearance’ (*phantasia katalēptikē*) (see Stoicism §12).

> An appearance (*phantasia*), being the origin of cognition in animals, ought, like light, both to reveal itself and to indicate the evident item which produces it.

But *phantasiai*, like unreliable messengers, do not always report correctly the information with which they are charged. What is more, even if a *phantasia* does manage to give a correct report,

> none is true in such a way that it could not be false; rather, for any *phantasia* which is thought to be true, a false *phantasia* indistinguishable from it (*aparallaktos*) can be found.

(Sextus Empiricus, *Against the Mathematicians* VII 163-4)

He offered numerous proofs and illustrations of this indistinguishability. Consider the twins, Castor and Pollux: it looks to me for all the world as though Castor is sitting opposite me at the dining table - and indeed he is sitting there. But is this appearance apprehensive, does it give me *knowledge* that Castor is there? No - for an indistinguishable appearance would have been caused by his twin, Pollux.

In general, if you know something, you must have apprehended it; apprehension is assent to an apprehensive appearance; and an appearance of something is apprehensive if it is true of that thing, if it was caused by that thing, and if it could not have been produced by anything else (see Stoicism §12). Like Arcesilaus, Carneades fastened on to the third condition:

> They say that they reject this one element, that something true can appear in such a way that what is false could not appear in the same way.

(Cicero, *Academics* II 33)

If an appearance is apprehensive, then were it not the case that so-and-so it could not seem to me that so-and-so. But this is never so: it *could* seem to me that Castor was sitting opposite me even if (say) not he but Pollux were there. No appearances are apprehensive. Nothing is known.

Thus far, destruction. But there is also an apparently positive side to Carneades' scepticism. Alongside the distinction between true and false appearances there is a second and independent distinction between 'plausible' (*pithanos*) and implausible opinions. (The word *pithanos* was often Latinized as *probabilis* and hence rendered in English as 'probable'; but 'probable', in its modern sense, is a false translation of *pithanos*.) Truth and falsity are determined by the relation of an appearance to the items *of which* it is an appearance. Plausibility and implausibility are determined by the relation of an appearance to the item *to whom* it appears. An appearance is plausible if it tends to persuade or to evoke assent: it looks to me as if there is a coil of rope in the potting-shed - and the appearance is plausible in so far as I find myself inclined to accept that there is a coil of rope there.

What is plausible for me may not be plausible for you. And there are degrees of plausibility, some appearances being more persuasive than others. Moreover, we may *scrutinize* our appearances. Perhaps it is really a snake, not a coil of rope? I prod about in the potting-shed with a stick: nothing budges - and I now have a 'scrutinized' plausible appearance of a coil of rope. Again, appearances do not come to us as isolated atoms: they arrive in molecules, so that a plausible appearance may be controverted or *uncontroverted* by its associates. There seem to be no sloughed skins in the shed, I see no notice urging me to Beware of Serpents in the Grass, and so on. None of the other appearances associated with the appearance of the coil of rope controverts that appearance: I have an 'uncontroverted and scrutinized' plausible appearance of a coil of rope.

Plausible appearances, however well scrutinized and however uncontroverted, may always be false. None the less, we shall prefer the plausible to the implausible, the more plausible to the less plausible, and the uncontroverted and scrutinized plausible to anything else.

Such is Carneades' account of plausibility: herein appeared to lie his chief innovation - on account of which his 'New' Academy was later distinguished from the Middle Academy of Arcesilaus. What was the philosophical role and function of the account? The problem is this: on the one hand, the plausible, of which Carneades seems to approve, is that which evokes *assent*; on the other hand, Carneades apparently argues for a scepticism which *repudiates* any act of assent. Carneades' own pupils were puzzled, and interpreters have found no solution which commands general agreement.

One of Carneades' pupils probably construed the theory of plausibility as a theory of knowledge. Carneades' destructive arguments proved that the standard account of knowledge was flawed. Hence he had to devise another account - and the theory of the plausible lay at its heart. Carneades was not a sceptic - on the contrary, the point of the *pithanon* pricks the bubble of scepticism (see Philo of Larissa §2). Later, St Augustine (on what authority is uncertain) affirmed that Carneades had never intended to attack 'ordinary' knowledge: his sceptical assault was limited to philosophical knowledge; and the theory of plausibility offered an account of our ordinary knowledge of ordinary things.

Or perhaps plausibility offers not knowledge but a knowledge substitute. We cannot strictly *know* anything - but that is no reason to suspend judgement, nor does it imply that all appearances are on an equal footing. Plausibility provides a criterion for rational belief - and rational belief is all we have on earth and all we need to have.

Sextus Empiricus presents Carneades' 'plausible' as a criterion of action: it is concerned with 'the discrimination of what is good and what is bad' (*Outlines of Pyrrhonism* I 226). Carneades suggests not that it is rational to *believe* what is plausible but that it is rational to *act on* what is plausible. (And rationality will recommend satisfaction with different degrees and types of plausibility in different practical circumstances.)

Or does the plausible play a purely descriptive and explanatory role? The question to which the plausible offers an answer is perhaps not 'How *should* a sceptic act?' but rather 'How *can* a sceptic act?' Dogmatists argued that without beliefs a sceptic could never stay alive (see Arcesilaus §2). But according to Carneades, a sceptic's actions may be determined by the appearances; for not all appearances are equally plausible - and a sceptic will be moved by the most plausible appearance. Not, of course, that a sceptic will *believe* the appearance to be true: the appearance evokes 'assent' merely insofar as it is acted upon.

These brief suggestions do not exhaust the gamut of interpretations; and the surviving texts scarcely allow a rational choice among them: only in the Elysian fields - if anywhere - shall we learn the truth about Carneades.

Carolingian renaissance

The 'Carolingian renaissance' is the name given to the cultural revival in northern Europe during the late eighth and ninth centuries, instigated by Charlemagne and his court scholars. Carolingian intellectual life centred around the recovery of classical Latin texts and learning, though in a strictly Christian setting. The only celebrated philosopher of the time is Johannes Scottus Eriugena, but the daring Neoplatonic speculations of his masterpiece, the Periphyseon (On the Division of Nature) are not at all characteristic of the time and are based on Greek sources (Pseudo-Dionysius, Gregory of Nyssa, Maximus the Confessor) generally unknown to his contemporaries. The mainstream of Carolingian thought is important for the history of philosophy in three particular ways. First, it was at this time that logic first started to take the fundamental role it would have throughout the Middle Ages. Second, scholars began to consider how ideas they found in late antique Latin Neoplatonic texts could be interpreted in a way compatible with Christianity. Third (as would so often again be the case in the Middle Ages), controversies over Christian doctrine led thinkers to analyse some of the concepts they involved: for instance, the dispute in the mid-ninth century over predestination led to discussion about free will and punishment.

1 General characteristics

It was Charlemagne himself who was in large part responsible for instigating the northern European cultural and intellectual renaissance of the late eighth and ninth centuries. From the mid-770s onwards, leading scholars gathered at his court, first men from southern Europe (where the tradition of classical learning still flourished) such as the Lombards Peter of Pisa, Paul the Deacon and Paulinus of Aquileia and the Spanish Goth Theodulf, who became bishop of Orleans, and then later the Anglo-Saxon Alcuin and his circle. During the reign of Louis the Pious (814-40) the intellectual movement, no longer encouraged at Court, was continued in the great monasteries such as Tours (where Alcuin had ended his life as abbot) and Fulda. By contrast, Charlemagne's grandson Charles the Bald (d. 877) was an enthusiastic promoter of learning and acted as patron and protector to the outstanding thinker of the period, Johannes Scottus Eriugena.

The Carolingian renaissance was one aspect of a wider renewal instituted by Charlemagne, which included reform of corruption and laxness in the clergy, restoration of correct latinity and the regularization of biblical and liturgical texts. The small elite of intellectuals at court, as well as writing history and engaging in theological dispute, composed classicizing poetry (quite often in panegyric of Charlemagne) in a self-conscious return to ancient models, parallel to the political renewal of antiquity which culminated in Charlemagne's imperial coronation in 800. Alcuin adopted the nickname 'Flaccus' (Horace) and addressed poems in classical metres to his group of intimate pupils. A library was built up at the court which contained copies of classical authors such as Lucan, Terence, Horace, Juvenal, Martial and Cicero; and after Charlemagne's death, Einhard wrote his life in a form imitated from Suetonius. In the mid-ninth century Lupus, Abbot of Ferrières, wrote elegant Latin letters which, in their concern for discovering and collating ancient texts, anticipate the interests of early modern humanists. Even Greek was studied in this period, especially by scholars of Irish origin such as Martin of Laon, Eriugena and Sedulius Scottus (also a fine Latin poet).

Historians often present the role of the Carolingian renaissance in the history of philosophy in terms simply of this rediscovery of ancient texts. Apart from Eriugena (who is envisaged as an isolated figure, inhabiting the thought world of Greek Neoplatonism or even nineteenth-century German idealism), Carolingian thinkers are described as passive assimilators of the ancient writings they began to study. Certainly, the forms and techniques favoured by thinkers of the time - excerption, paraphrase, compilation and glossing - give an impression of servility. Yet, through their particular interests and emphases, Carolingian thinkers set the direction for the subsequent course of medieval philosophy, a direction quite different from what late antique precedent would have suggested. With the exception of Eriugena, Carolingian thinkers did not take up the Neoplatonic systematizing of the Greek tradition after Plotinus, nor did they reflect the strong emphasis on rhetoric characteristic of classical Latin culture. Their thought is typified rather by the important place of logic and grammar; by the attempt to reach a Christian interpretation of pagan motifs and philosophical ideas; and by the importance of controversies over Christian doctrine in stimulating argument and analysis.

2 The revival of logic

It is no surprise that grammar should have been important in Carolingian education, since Latin was now (even in romance areas) not a mother tongue but a language which needed to be learned. But it is striking how, even in this period, grammarians went beyond straightforward linguistic instruction to explore some of the semantic problems raised in Priscian's *Institutiones grammaticae (Principles of Grammar)*. There was no such obvious didactic reason for the study of logic, yet this subject was central to Carolingian education. Already in the *Libri Carolini*, (written very probably by Theodulf of Orleans, *circa* 789-92), ostentatious use is made of formal logical methods of argument. In the 790s, Alcuin prefaced a late antique paraphrase of the *Categories*, which he attributed to Augustine, with a dedicatory verse epistle to Charlemagne: the *Categoriae decem (Ten Categories)*, as it was called, would be the most widely studied logical text in the next century. Alcuin also composed a treatise on logic; this was a patchwork of borrowed passages, especially from two late antique Christian encyclopaedists, Cassiodorus and Isidore of Seville (see Encyclopedists, medieval §§6-7), and from the *Categoriae decem*. Whereas Isidore had treated logic as a verbal art, and both he and Cassiodorus had placed great emphasis on syllogistic argument, Alcuin saw the ten categories as central to the subject, and he used them in understanding the Trinity and in order to distinguish God from his creation. Alcuin's pupils (especially a fellow Anglo-Saxon, Candidus) continued and extended these interests. A set of passages (the 'Munich passages', *circa* 800) connected with Candidus contains logical extracts and exercises, discussions of the Trinity and also a short dialogue which makes an original adaptation of Augustine's arguments for the existence of God. At much the same time another of Alcuin's pupils, Fredegisus, composed a little treatise *De substantia nihili et de tenebris (On the Substance of Nothing and on Darkness)*, which attempts, rather unsuccessfully, to elucidate the reference of 'nothing'.

From the 850s onwards, interest in logic intensified. For example, in his *Liber de anima (Book on the Soul)* in the early 860s, Ratramnus, a monk at Corbie, turned a question raised by Augustine about the relationship between individual souls and the hypostasis Soul into a logical discussion about the relations between individual souls and the universal soul. The earliest glossed manuscripts of the *Categoriae decem* date from about ten years later. Some use the logical doctrines here as opportunities to develop the characteristic ideas of Eriugena (often without much real connection with the text). Others concentrate on more down-to-earth explanation of fundamental logical terms and concepts. They indicate the beginning of a process of careful study of ancient logical texts, which would ensure that, by the eleventh century, a high level of logical proficiency was common among well-trained thinkers (see Language, medieval theories of; Logic, medieval).

3 Platonism and Christianity

The sources for ancient philosophy which first began to be used in the Carolingian period would remain the principal ones until the late twelfth century. On the one hand, there were writings by Church Fathers which were strongly marked by Neoplatonism - for example, Augustine's *De trinitate (On the Trinity)*, heavily influenced by Plotinus, which was available earlier but not exploited by medieval writers until the time of Charlemagne (in, for instance, Alcuin's *De fide sanctae trinitatis (On Faith in the Holy Trinity)* (see Augustine; Patristic philosophy). There were also the pseudo-Dionysian writings, redolent of Proclus, which reached the West in 827 and were translated into Latin first by Hilduin, Abbot of St Denis and then, more successfully, by Eriugena in the late 850s (see Pseudo-Dionysius). On the other hand, there was a handful of more direct witnesses to ancient philosophy. Plato's *Timaeus*, in the partial translation of Calcidius, was in Charlemagne's library. Alcuin is the first medieval author to use Boethius' *De consolatione philosophiae (On the Consolation of Philosophy)*. The allegorical prosimetrum by Martianus Capella, *De nuptiis Philologiae et Mercurii (On the Marriage of Philology and Mercury)* began to be read in the early ninth century (and was being glossed intensively a few decades later), and Macrobius' commentary on Cicero's *Somnium Scipionis (Scipio's Dream)* came into use at much the same time (see Encyclopedists, medieval §§3-4).

These direct witnesses posed Carolingian scholars with the problem of how to treat explicitly pagan material. This arose most directly in connection with the *De consolatione philosophiae*. Boethius was a Christian, but he omits any openly Christian doctrine from the *De consolatione* and, in sections such as the metrum (III, m.9) *O qui perpetua*, his epitome of the *Timaeus*, he mentions pagan ideas (reincarnation, the World Soul) which are rejected by Christianity (see Boethius, A.M.S. §5). Two commentaries from the end of the ninth century illustrate diametrically opposed ways of tackling the problem. Remigius of Auxerre, the most prolific of late Carolingian

commentators on secular texts, chooses to interpret everything in an explicitly Christian sense and either treats references to pagan doctrines as mere analogies or ignores them entirely. By contrast, Bovo, a monk of Corvey, begins his commentary (solely on *O qui perpetua*) by expressing surprise that Boethius, though a Christian, 'did not discuss anything of Church doctrine, but wished to reveal the teachings of the philosophers, especially the Platonists, to his readers'; and he then goes on, with obvious relish, to give a surprisingly accurate exegesis of the pagan ideas in the poem. But Bovo's bold position would have few imitators, whereas Remigius' Christianizing interpretation of pagan texts set a model for the next three centuries (see Platonism, medieval).

4 Doctrinal dispute and philosophical analysis

Early in the Carolingian renaissance, the need to answer and convincingly reject the Greek position on image-worship proposed at the second Council of Nicaea provoked the most ambitious theological treatise of the period, the *Libri Carolini*. Throughout the period, doctrinal controversies (on Christology, the Trinity and predestination) continued to provide an impetus towards systematic thought. Not only did they force scholars to collect and order dossiers of authoritative material from the Church Fathers to support their case (as with Alcuin's voluminous works against the Adoptionist heresy), they also encouraged them to analyse and explore difficult and important concepts.

The mid-ninth-century controversy over predestination was particularly important in stimulating philosophical analysis. The dispute was begun by Gottschalk of Orbais, who, so his opponents claimed, held that divine predestination was dual: of the blessed to salvation and of the wicked to damnation. Eriugena's contribution to the debate in his *De praedestinatione (On Predestination)* is well known for its use of logic and its adoption of a number of Neoplatonic themes in establishing its radical conclusions. However, the sophistication of other participants in the controversy is less often noted. For example, both Hraban Maur (Hrabanus Maurus), Abbot of Fulda, and Hincmar, Archbishop of Rheims, made the distinction in their attacks on Gottschalk between predestining and foreknowing, and both recognized (though they did not fully overcome) the danger that, even if God is said to predestine only to salvation, he will seem arbitrary in his choice of whom so to predestine. Those who attacked Eriugena's treatise also showed greater acumen than is commonly recognized. For instance, Prudentius of Troyes challenges Eriugena's conceptual analysis of free will - especially his distinction between the will itself and its strength and power, and Florus of Lyons enters into a discussion of how different types of words signify in order to show the weakness of Eriugena's theory of sin (see Predestination).

Cassirer, Ernst (1874-1945)

Cassirer is one of the major figures in the development of philosophical idealism in the first half of the twentieth century. He is known for his philosophy of culture based on his conception of 'symbolic form', for his historical studies of the problem of knowledge in the rise of modern philosophy and science and for his works on the Renaissance and the Enlightenment. Cassirer expanded Kant's critique of reason to a critique of culture by regarding the symbol as the common denominator of all forms of human thought, imagination and experience. He delineates symbolic forms of myth, religion, language, art, history and science and defines the human being as the 'symbolizing animal'. All human experience occurs through systems of symbols. Language is only one such system; the images of myth, religion and art and the mathematical structures of science are others.

Being of Jewish faith, Cassirer left Germany in 1933 with the rise of Nazism, going first to Oxford, then to university positions in Sweden and the USA. In the last period of his career he applied his philosophy of culture generally and his conception of myth specifically to a critique of political myths and to the study of irrational forces in the state.

1 Life

Ernst Cassirer was born in the German city of Breslau (now Wrocław, Poland) on 28 July 1874; he died suddenly, of a heart attack, on the Columbia University campus in New York on 13 April 1945. His life was a personal and intellectual 'odyssey' that took him from Europe to the USA, and led him from the Marburg Neo-Kantianism of his teacher, Hermann Cohen, to his own broad vision of human culture and a critique of the modern state. Cassirer lectured as *Privatdozent* at the University of Berlin from 1906 until 1919, when he accepted a professorship at the newly founded University of Hamburg; he served as its rector in 1929-30.

After Hitler's assumption of the chancellorship of Germany in January 1933, Cassirer left Germany. He taught from 1933 to 1935 at All Souls College, Oxford and then accepted a professorship at the University of Göteborg, Sweden. In 1941 he moved to Yale University in the USA, and then went to Columbia University for the academic year 1944-5. Cassirer published nearly 125 books, essays and reviews and left a number of unpublished papers.

2 Philosophy of symbolic forms

Cassirer published the major work of his philosophy, *Philosophie der symbolischen Formen (The Philosophy of Symbolic Forms: vol. 1, Language; vol. 2, Mythical Thought; vol. 3, The Phenomenology of Knowledge)*, from 1923 to 1929, but his conception of 'symbolic form' goes back to the philosophy of science he formed a decade earlier. Modern scientific thought, Cassirer holds, is based on the 'functional concept'. As opposed to the Aristotelian theory of concept formation, in which a common substantial element is sought through a comparison of the similarities and differences of a class of particulars, the functional concept is formed by articulating a principle by which a set of particulars can be ordered as a series. This principle of serial arrangement of a group of particulars, unlike a substance, has no reality or meaning independent of the elements it orders, and these elements have meaning only in terms of the positions they each occupy in the series. Cassirer formulated this indissoluble bond between universal and particular of the functional concept as F (a, b, c, …). It suggested to him a model for how the mind forms experience in all spheres of human activity, cognitive and noncognitive.

The historical source for this insight is Kant's idea of the 'schema', a conception of sensuous-intellectual form that is presupposed by all acts of human knowledge. What Kant delineates abstractly as one of the principles of his first *Critique*, Cassirer finds as a phenomenon within human experience: the symbol. The critique of reason becomes the critique of culture. Each area of human culture has its own way of bringing sensed particulars together in symbolic orders. Each area of culture has its own 'inner form' - its own formation of the object, its own causality, its own apprehensions of space, time and number. These various symbolic forms of culture differ from each other in their individual 'tonality', and human culture as a whole is ideally a harmony of these forms.

The symbolic forms are frequently thought of as a list, following the chapter titles of Cassirer's *An Essay on Man* (1944): myth and religion, language, art, history and science. Cassirer also suggests the possibility of additional symbolic forms, such as economics, morality and technology. In *The Phenomenology of Knowledge*, the third volume of *The Philosophy of Symbolic Forms* (1923-9), Cassirer presents three symbolic forms as corresponding

to the fundamental functions of the development of consciousness. He makes clear that he is using the term ‘phenomenology’ not in Husserl’s sense but in Hegel’s, that is, as developmental, not descriptive phenomenology. All knowledge and culture originates in the ‘phenomenon of expression’, the *Ausdrucksfunktion* of consciousness. At the level of ‘expression’, (*Ausdruck*) the object is ‘felt’ in its immediacy. Consciousness at this level takes the form of myth. Symbol and symbolized occupy the same level of reality. The dancer who dons the mask of the god *is* the god. The mythic image in its felt immediacy gives way to the logical powers inherent in language; this produces the ‘representational function’ (*Darstellungsfunktion*). This function builds a world of common-sense objects, of thing-attribute relationships and classes. Symbol and symbolized now are different orders of reality. Symbols refer to things. Beyond this is the purely ‘significative function’ (*Bedeutungsfunktion*) of scientific and theoretical thought. At this level the power of the symbol to generate ‘symbolic systems’ occurs. Here symbols can refer in fully determinate ways to other orders of symbols. The purest examples of this are mathematics and mathematical logic.

In a fourth volume of *The Philosophy of Symbolic Forms*, left incomplete in manuscript at his death, Cassirer considered ‘the metaphysics of symbolic forms’. He examined how the expressive function of consciousness is the most fundamental manifestation of spirit (*Geist*) and how spirit is a transformation of life (*Leben*). Cassirer discusses a number of conceptions of life in modern philosophy and is led to his own doctrine of ‘Basis-phenomena’ (*Basisphänomene*), the foremost of which, he claims, is life. Life is the ongoing flow of existence that is first formed by the human power of expression, out of which, as described above, arise all forms of human culture.

3 Historical studies

Cassirer did not approve of ‘hurling one’s ideas into empty space’ without showing their relation to the historical development of philosophy. Not only does he ground his original ideas in their historical sources and in the fields he discusses, he is the author of a large corpus of work in intellectual history. He wrote books and essays on Leibniz, Descartes, Kant and Rousseau, and edited a three-volume edition of Leibniz’s philosophical works as well as one of the standard editions of Kant’s works. Cassirer published essays on figures in humanist thought such as Hölderlin, Kleist, Humboldt, Schiller, Shaftesbury, Pico della Mirandola, Thomas Mann and Schweitzer. In the philosophy and history of science he wrote on Galileo, Newton, Einstein’s relativity and Bohr’s indeterminacy principle. Cassirer’s systematic interpretation of the history of philosophy is centred on two series of works: his four-volume history, *Das Erkenntnisproblem in der Philosophie und Wissenschaft der neueren Zeit (The Problem of Knowledge in Philosophy and Science in the Modern Age)* (1906, 1907, 1920) and his trilogy, *Individuum und Kosmos in der Philosophie der Renaissance (The Individual and the Cosmos in Renaissance Philosophy)* (1927), *Die Platonische Renaissance in England und die Schule von Cambridge (The Platonic Renaissance in England)* (1932a) and *Die Philosophie der Aufklärung (The Philosophy of the Enlightenment)* (1932b). Cassirer began his study of the problem of knowledge intending to show how this problem develops in the simultaneous rise of modern philosophy and modern science, beginning with Nicholas of Cusa and culminating in Kant. Later he continued the theme in the post-Kantian systems through in Hegel, and much later, when in Sweden, he considered the shape of the contemporary sciences.

His trilogy of studies goes over some of the same ground as his earlier work, but in a more agile way and to a different purpose. He begins with Nicholas of Cusa, but his aim is to show how the Renaissance can be understood as a whole in terms of the problem of the individual and the cosmos. He then shows how the ideas of the Renaissance were transmitted via the Cambridge Platonists to culminate in the Enlightenment. Cassirer wishes to present a ‘phenomenology of philosophic spirit’. This is not a progression of problems of pure thought, but the generation of a philosophical point of view on the individual, the world and society, in which the problems of knowledge are tied to the whole of human activity (see Platonism, Renaissance; Renaissance philosophy).

It is not possible to understand the basis of Cassirer’s philosophy without an awareness of his debt to Goethe (see Goethe, J.W. von §3). Goethe’s understanding of organic form is important for Cassirer’s conception of the symbol, and his cosmopolitanism influences Cassirer’s conception of culture. Goethe is the source of Cassirer’s grasp of human creation as a process of self-liberation, a sentiment Cassirer extends to the whole of culture. He wrote on various aspects of Goethe’s thought, but he was influenced more by Goethe’s spirit and sense of life than by his interest in particular questions of interpretation.

4 Myth and the state

Cassirer does not have a political philosophy in the traditional sense. He has a critique of the modern state and a definite view of the relation of philosophy to politics. In his inaugural lecture at Göteborg in 1935, Cassirer recalled Kant's distinction between a 'scholastic' conception of philosophy and a conception of 'philosophy as related to the world' (*conceptus cosmicus*). Cassirer said that he as well as others have been guilty of the former and he aligns himself with the latter. He quotes Schweitzer, his ethical hero, who calls philosophy a 'watchman' who slept in the hour of peril, and did not keep watch over us during the rise of totalitarianism. Cassirer holds that philosophy does not and cannot cause the events of political life, nor can it resolve them, but it has a duty to act as our conscience, to inform us of them by the use of its powers of reflection. In *The Myth of the State* (1946) and other writings of this period, Cassirer attacks Heidegger's conception of 'thrownness' (*Geworfenheit*) as a conception of the human condition that puts philosophy in a position where it can no longer 'do its duty'. This goes back to Cassirer's debate with Heidegger in 1929 at Davos, Switzerland. Quoting Goethe, Cassirer sees human freedom as tied to the human project of spirit (*Geist*), of the creation of culture. Heidegger sees freedom as requiring a 'breakthrough' (*Einbruch*); freedom is not part of the human condition itself, but is contingent (*zufällig*) (see Heidegger, M. §5).

Cassirer's philosophy of mythology is the most original part of his epistemology and phenomenology of knowledge. He shows that myth is not a collection of errors or a world of unchecked emotions but a total way of thinking and symbolizing, which exists at the beginning of human culture and is present as a phase in the development of any subsequent symbolic form. Myth is always present as the expressive moment in any act of cognition. In *An Essay on Man*, Cassirer claims that his philosophy of culture is an extension of the ancient ideal of self-knowledge and that human culture as a whole is the process of humanity's 'self-liberation'. The key to self-knowledge and culture is freedom from the immediacy of the object.

In *The Myth of the State*, Cassirer is able to apply the force of his entire philosophy of culture towards understanding the logic of modern political myths. They are a revival of the logic of the primordial forms of expressive consciousness. Modern political myths are not natural; they are manufactured products joined to the technology of mass communication. Such myths shape the life of the state and become the substitute for its rational principles. Cassirer sees this not only as true of Nazism, but also as a danger in the modern state itself. He claims that myth is impervious to argument, but that philosophy can warn us of it and allow us to understand it.

Casuistry

Casuistry, from the Latin casus *(cases), has been understood in three separate yet related senses. In its first sense casuistry is defined as a style of ethical reasoning associated closely with the tradition of practical philosophy influenced by Aristotle and Aquinas. In its second sense it is reasoning about 'cases of conscience' (*casus conscientiae*). The third sense, moral laxism, arose out of Pascal's famous critique of casuistry, which did much to diminish its influence. In recent years, however, a renewed interest in the first and second senses of casuistry has been witnessed in the areas of practical reasoning and applied philosophy.*

In its widest sense, casuistry can be described as a method of ethical reasoning which, drawing on the tradition of practical philosophy of Aristotle and Aquinas, aims to construct a 'dialectic' between the facts of particular cases and the antecedent assumptions, evaluations and convictions which individual agents bring to bear in their consideration of such cases. The purpose of the dialectic is to enable agents to arrive at informed decisions as to what is morally possible and impossible for them to do in particular cases. In a narrower sense, the term casuistry has been employed to characterize different systems of moral theology within the Christian, Jewish and Islamic traditions, in which all-inclusive norms are derived from judgments in particular cases, instead of being laid down in advance by absolute moral codes. In its narrowest sense, casuistry refers to the use of subtle definitional distinctions in the handling of the problems of moral theology, with the aim of drawing fine dividing lines between what is and is not permissible at the level of action. The technique has at times been used to excuse crimes and sins, thereby exculpating the immoral, and such is the extent of the modern association of casuistry with all varieties of obfuscation, quibbling and laxism, that a pejorative connotation of the word itself is now established in most European languages.

The identification of casuistry with its narrowest definition is due to Blaise Pascal's *Lettres écrites à un provincial (The Provincial Letters)* (1656-7) (see Pascal, B.). This famous satire delivered to casuistry a near fatal blow, from which, in the popular mind, it has never recovered. It was Pascal's urbane yet brutal vilification of the Jesuit confessors of the University of Paris, individuals who had attempted to base an account of practical conduct on the analysis of cases (*casus*) and circumstances (*circumstantiae*), that stereotyped casuistry as the doctrine that sought 'to excuse the inexcusable'.

Pascal's attack on casuistry can be considered unjust since it was based on a partial understanding of the theories he was aiming to expose, and of the individual casuists he was attempting to ridicule. His aim in writing this work was to enlist the reader's support for a version of moral absolutism that was peculiar to Jansenism, a rigoristic Roman Catholic sect to which Pascal was aligned. Pascal was forever trying to illustrate the laxism inherent within Jesuit casuistry in order to establish an unfavourable contrast with the moral rigorism of the Jansenists.

The method embodied in the second definition of casuistry as case-reasoning was developed in the penitential handbooks of the Middle Ages and reached its fullest expression in Roman Catholic textbooks of moral theology of the Counter-Reformation. The method was also embraced by a number of Anglican divines and members of the Reformed tradition. The impetus behind the case-method lay in the desire among theologians and philosophers to discover the moral norms embodied in divine law in the circumstances of human life, rather than finding them in antecedent absolute norms which one could then apply to a set of cases. Thus, the case-reasoning of the theologians was able to respond to new situations and novel problems with a commendable degree of good sense, originality and doctrinal flexibility.

In recent times the case-method of the theologians has been revived in the field of bioethics (see Bioethics). For bioethicists the value of casuistry resides in its emphasis of practical problem-solving by means of a nuanced interpretation of individual cases. This is thought to have greater consonance with the actual conditions of medical practice and decision-making. Problems arise, however, when one attempts to achieve the transposition of the case-method of the theologians to the modern secular context of bioethics. The confessors of Roman Catholic casuistry, in particular, possessed both juridical authority and the authority of being experts within an institutional setting. Yet the new casuists of bioethics must rely on professional knowledge alone to determine morally adequate judgments in particular cases. The problem here is one of analogy. The older casuistical method relied upon interpretative authorities such as confessors and canonists which helped to bolster the idea that the judgments

made in particular cases would reflect the assumptions of a common morality. Given the context of moral pluralism in which bioethical judgments are made, it is difficult to see how bioethics can draw upon the same type of paradigmatic examples of 'right' and 'wrong' moral judgment on which the earlier model of casuistry was based (see Moral pluralism; Moral expertise).

It is in its widest sense, in the context of moral philosophy, that casuistry holds its greatest promise. As a dialectical method of moral reasoning inspired by Aristotle and Aquinas, casuistry may well prove relevant here in virtue of its opposition to inflexible and literal interpretations of moral principles, and its resistance to any ethical attitude which first absolutizes a universal moral norm and then insists on its all-round and unyielding application, while denying any abatement or adjustment to changing contingencies.

Categories

Categories are hard to describe, and even harder to define. This is in part a consequence of their complicated history, and in part because category theory must grapple with vexed questions concerning the relation between linguistic or conceptual categories on the one hand, and objective reality on the other. In the mid-fourth century BC,Aristotle initiates discussion of categories as a central enterprise of philosophy. In the Categories he presents an 'ontological' scheme which classifies all being into ten ultimate types, but in the Topics introduces the categories as different kinds of predication, that is, of items such as 'goodness' or 'length of a tennis court' or 'red', which can be 'predicated of' subjects. He nowhere attempts either to justify what he includes in his list of categories or to establish its completeness, and relies throughout on the unargued conviction that language faithfully represents the most basic features of reality. In the twentieth century, a test for category membership was recommended by Ryle, that of absurdity: concepts or expressions differ in logical type when their combination produces sentences which are palpable nonsense.Kant, working in the eighteenth century, derives his categories from a consideration of aspects of judgments, hoping in this manner to ensure that his scheme will consist exclusively of a priori concepts which might constitute an objective world. The Sinologist Graham argues that the categories familiar in the West mirror Indo-European linguistic structure, and that an experimental Chinese scheme exhibits suggestively different properties, but his relativism is highly contentious.

1 Categories in Aristotle

Despite the historical importance of category theory in Western philosophy, it is remarkably difficult to grasp what a category is and how a category theory might achieve legitimacy. To a degree, such elusiveness is simply the product of the lengthy and elaborate historical development these theories have sustained, but the profundity of the issues they broach also contributes to the puzzle - and hence to the abiding interest - of categories.

Orthodoxy has it that Aristotle in the treatise appropriately entitled *Categories* introduces categories to the Western tradition: ' of things said without any combination, each signifies either substance or quantity or qualification or a relative or where or when or being-in-a-position or having or doing or being-affected' (1b 25-7). Despite what his phrasing might easily be (and often has been) taken to imply, Aristotle plainly intends to refer, not to linguistic items, but rather to their referents. Thus his sentence might be paraphrased 'of things to which we can refer in uncombined (namely syntactically simple) language, each is.….', and it enumerates all the types of being there are: substances, such as human beings; quantities, such as three feet long; qualities, such as red; and so forth. But although his manner of expression is in one sense misleading, it should not be deplored or dismissed as merely something like a trivial confusion of material and formal modes of speech. Rather, here, as so often elsewhere, Aristotle is moving from what we would regard as features of language to features of the world without so much as signalling any recognition that there is a transition to be made. Nor does he explain how he arrived at his list, or why one should feel confident that it is comprehensive (see Aristotle §7).

To complicate matters further, there are compelling grounds for the belief that, despite the tradition, the genera of being with which the *Categories* deals are not (Aristotelian) categories. The word which we transliterate 'category' is employed by Aristotle to mean 'predicate' or '(type of) predication', so that a 'category theory' ought to be a theory of predication, not of being. And in a relatively unfamiliar text, *Topics* (I 9), this is just what we do find. After saying that the types of predication must be distinguished, Aristotle provides a list identical to that in the *Categories* - except that the first item is not 'substance', but 'what it is' (103b 21-3). In the *Categories*, individuals such as Socrates are substances pre-eminently, and species such as human being are substances secondarily: in the *Topics*, in contrast, colour is the 'what it is' of red no less than human being is the 'what it is' of Socrates.

What the *Topics* delivers, then, is a theory of predication according to which the predicates which can characterize any subject whatsoever will fall into ten ultimate kinds. Again, defence of this list in particular (or of the possibility of constructing *any* non-arbitrary, correct list) is lacking; but reflection on why the *Topics* was written might make the absence of this defence considerably less shocking, though at the cost, ironically enough, of undermining the status which the categories of the *Categories* have historically enjoyed. The *Topics* as a whole comprises prescriptions for the classification and analysis of a vast array of the sorts of argument then current in

Greek philosophy. The intention is combative as well as constructive: Aristotle also teaches how to detect and dismember what he considers sorts of fallacious reasoning, and prime among these is ignorant or malicious exploitation of confusion in manner of predication. For example, what is good about food? That it does something - it produces pleasure. What is good about human beings? That they are 'of a certain quality, such as temperate or courageous or just' (*Topics* I 15.107A). So, if viewed as a digest of types of predication already familiar from the practices of Greek dialectic, the categories of the *Topics* require no defence beyond reasonable fidelity to the range of predicates actually found in the typical dialectical repertoire. In particular, there need be no presumption that predicational categories rooted in philosophical practice will correspond to a significant, let alone universal, ontological classification.

This is not to say that predicational and ontological categories are unrelated. Because Aristotle moves with disconcerting freedom from language to the world, he takes it for granted that predicate expressions do usually, without the possibility of radical misrepresentation, refer to real entities. So a scheme of predicational categories might indeed suggest at least the outline of a corresponding ontological scheme, one justified in detail and scope precisely to the extent that the original classification of predicates, and its extension, are well-founded. If this is the correct account of how these theories developed in Aristotle, what prompted the substitution of ontological 'substance' for predicational 'what it is'? Perhaps the governing idea of the *Categories* is that substance alone can serve as the subject in which items from other categories inhere: for instance, Socrates, but not his height, is pale-skinned and can properly be said to be pale-skinned. Therefore the design of the treatise is to convince us that, at its deepest level, ontology is marked by a crucial asymmetry between substantial and non-substantial being, quite possibly in a spirit hostile to the elevation of Platonic Forms which, far from being most real, would figure as no more than non-substantial, parasitic things. If so, a further irony is that the *Categories* was intended to establish a metaphysical thesis essentially independent of the grand classificatory ambitions with which it came to be historically associated. In the event, the philosophical tradition which was dominated by the followers of Aristotle since late antiquity, elevated the ontological categories into a system uniquely capable of displaying the lineaments of what is (see Being §2; Substance).

2 Categories in Ryle

The most noteworthy modern contribution to the theory of categories is that of Gilbert Ryle, in that he tries to throw light on the difficulty which Aristotle left entirely obscure: how to identify and discriminate between categories (see Ryle, G. §2). Ryle contends that one determines the logical category or type of an expression by ascertaining the field of sentence-forms into which it can enter without resultant absurdity. For example, 'four' can complete the frame '.….is a prime number' to yield a meaningful (if false) sentence, while 'Socrates', or so Ryle would urge, cannot. Such nonsense exemplifies what Ryle famously dubbed the 'category-mistake', the production of absurdity as the upshot not of lexical or grammatical irregularity but of the vain effort to combine the logically uncombinable. He conceived of category theory as a diagnostic tool for the exposure and resolution of chronic philosophical disputes. Ryle proposed that disputants on either side of, say, the mind-body problem are really at cross-purposes: they have put forward propositions which only seem to conflict, since their difference in type removes the possibility of any logical relations, whether of implication or of incompatibility, holding between them. At one point Ryle was willing to go so far as to proclaim that ' philosophy is the replacement of category-habits by category-disciplines' (1949: 10).

Although Ryle regarded Aristotle's theory as the ancestor of his own, an obvious dissimilarity is that Rylean categories, defined as they are by multiple logical relations, are potentially unlimited in number: Ryle was keen to explore what he termed 'the logical geography of concepts', not to engage in pigeonholing. The great awkwardness looming over Ryle's theory is that all ventures to make out a principled difference between mere falsehood and the nonsense allegedly distinctive of category-mistakes have come to grief. But if Ryle did not finally achieve a strict criterion for the identification of categories, he nevertheless did successfully sharpen the powerful and once widely-shared intuition that certain propositions - some of philosophical importance - must be rejected not as false, but as (veiled) nonsense.

3 Categories in Kant

The basic problem of specifying what a category theory is, is unavoidably aggravated by Kant, the second major historical influence to shape the tradition (see Kant, I. §4). Kant arrives at his alternative categories by considering

the conditions which allow there to be a logic of judgments, a procedure which he explicitly attributes to Aristotle, while emphasizing the divergence of their conclusions (Kant 1781/7: A80, B105). He asks: Which judgement forms does logic treat of? His answer is that all judgements have a 'quantity' (universal, particular or singular) and a 'quality' (affirmative, negative or infinite). They must all instantiate one of the 'relations' (categorical, hypothetical or disjunctive), and one of the 'modalities' (problematic, assertoric or apodeictic) (Kant 1781/7: A70, B95). Kant proposes to derive his categories from these forms or aspects of judgment, obtaining the corresponding list of unity, plurality and totality under 'quantity'; reality, negation and limitation under 'quality'; inherence and subsistence, causality and dependence, and community under 'relation'; and possibility-impossibility, existence-non-existence and necessity-contingency under 'modality' (Kant 1781/7: A80, B106). He pretends that their derivation from the types of judgement makes his categories superior to Aristotle's, because this procedure supposedly guarantees that all the concepts of pure understanding, and no others, are systematically discovered.

Every element of empirical reality must fall into place within this scheme, since the categories exhaust the understanding's a priori concepts. Kant's eventual aim in the Transcendental Deduction is to prove that, since every experience involves judgement, every possible experience must involve use of the categories. Specifically, his claim is that one must conceive of experience as experience of a world organized by the categories.

The conviction that Aristotelian genera of being and Kantian concepts of understanding cannot, *pace* Kant, be in competition, is hard to avoid since the philosophical projects which gave a point to these various theories are so diverse. But we should not hastily conclude that these schemes have nothing of philosophical importance in common. Aristotle's transitions from what we are likely to classify as linguistic or conceptual data to robustly realist theses seem surprisingly bold, even unmotivated; but that is precisely because we are heirs to the Kantian legacy which insists on our right to empirical realism but concedes the obligation to earn it by espousing transcendental idealism.

Aristotle blithely assumes that the fabric of the world is accessible to us, disclosed by the range of predications people, at any rate those of a philosophical disposition, have been disposed to make; he mounts no argument for the reliable accuracy of predication. True, it is not as if later Aristotelians ignored the issue of what the categories are categories of. Because the *Categories* was incorporated into the *Organon* - which came to be the traditional logic course, culminating in the analysis of arguments - some interpreters were indeed inclined to the position that the *Categories*, which began the logic course, ought to deal with the simples from which propositions making up arguments are constructed, and so favoured the identification of categories with words. Other strands in the tradition preferred a realistic interpretation, while nevertheless asserting a thorough-going isomorphism between the structures of the world, our concepts and the words in which we express ourselves (this 'isomorphic' interpretation is vividly and compendiously presented in, for example, the Renaissance *Conimbricenses* commentary on the *Organon*). Still, even Aristotelians sensitive to the question 'what are categories categories of?', neglected the gulf which might separate our conceptual and linguistic resources from what really is: such isomorphism is viable only if grounded in a pre-modern assurance that an impersonal teleology or a divine providence secures and protects the fit between us and the world.

Kant's transcendentalism attempts to redeem such hostages to scepticism. We might accordingly conceive of both theories of categories as intimately concerned with the relation of language or our conceptual equipment to the world. To the Kantian, Aristotle seems primitive because he naïvely fails to perceive the paramount challenge confronting philosophy; to the modern follower of Aristotle, the Kantian seems the decadent victim of unjustifiable doubts.

4 Are categories universal?

The impression that Aristotelian and Kantian theories have a vital disagreement in common is strengthened if we move beyond the Western tradition in which they are such towering presences. Angus Graham (1989) endorses the contention, most frequently linked with the name of the famous linguist Benveniste, that the Aristotelian categories represent nothing more than yet another bogus reification of Indo-European linguistic forms. For example, 'quantity' in Aristotle's list is the translation of a Greek word which functions as both an interrogative ('how much?') and an indefinite adjective ('so much'). Thus it is argued that peculiarities of Indo-European grammar have encouraged the construction and success of a categorical scheme which, viewed from a broader linguistic perspective, is nothing more than the deluded inflation of quite parochial traits of familiar languages into general

features of reality itself.

Graham goes on to try to substantiate this charge of Indo-European parochialism and to show that moderate versions of 'linguistic relativism' are acceptable - that is, that the narrowly linguistic properties of a language (its syntax, its degree of inflection and so on) encourage or discourage certain thought-patterns in its users. He sketches a scheme of Chinese categories derived from Chinese interrogative patterns, on the assumption that Aristotle had unreflectingly extrapolated his from Greek ones. For example, if the Aristotelian category of substance is the natural linguistic correlate of the question 'what is it?', the analogous Chinese interrogative *ho* solicits an answer in terms of *lei*, kind or type of thing (for example, human) rather than essence or basic nature (for example, rational biped). His global hypothesis is that the Chinese preference for 'which?' over 'what?' questions betrays a holistic cast of mind, felt throughout Eastern philosophy, originating in the inevitable congruence of Chinese thought with Chinese language.

Graham's version of linguistic relativism is arresting but very hard to vindicate. Quite apart from the obstacle that in the *Topics* the category 'what it is' groups non-substantial subjects as well as substances, Graham's relativistic interpretation presupposes that Aristotle proceeded in blinkered ignorance of the (alleged) fact that his native language variously stimulated and inhibited his tendency to propound ontological doctrines. But inspection of his works amply demonstrates that Aristotle is acutely aware of the linguistic traps into which philosophers are prone to fall. After all, in large measure the goal of the *Topics* is to alert us to such dangerous possibilities, and Aristotle's exercises in linguistic analysis often reach a pitch of extreme sophistication. This is not to say that gauging the impact of language on category theories is fruitless: only that they must not be reduced to a paltry imposition of fortuitous linguistic structure onto a world actually untouched by such strictly local projections. Relativistic objections do not foreclose the debate between Aristotelian confidence and Kantian caution.

Category theory, applications to the foundations of mathematics

Since the 1960s Lawvere has distinguished two senses of the foundations of mathematics. Logical foundations use formal axioms to organize the subject. The other sense aims to survey 'what is universal in mathematics'. The ontology of mathematics is a third, related issue.

Moderately categorical foundations use sets as axiomatized by the elementary theory of the category of sets (ETCS) rather than Zermelo-Fraenkel set theory (ZF). This claims to make set theory conceptually more like the rest of mathematics than ZF is. And it suggests that sets are not 'made of' anything determinate; they only have determinate functional relations to one another. The ZF and ETCS axioms both support classical mathematics.

Other categories have also been offered as logical foundations. The 'category of categories' takes categories and functors as fundamental. The 'free topos' (see Lambek and Couture 1991) stresses provability. These and others are certainly formally adequate. The question is how far they illuminate the most universal aspects of current mathematics.

Radically categorical foundations say mathematics has no one starting point; each mathematical structure exists in its own right and can be described intrinsically. The most flexible way to do this to date is categorically. From this point of view various structures have their own logic. Sets have classical logic, or rather the topos Set has classical logic. But differential manifolds, for instance, fit neatly into a topos Spaces with nonclassical logic. This view urges a broader practice of mathematics than classical.

This article assumes knowledge of category theory on the level of Category theory, introduction to §1.

1 Categorical thinking

The notion of 'isomorphism' aptly illustrates categorical thinking. In algebra two groups with the same group structure are 'isomorphic'. Two spaces with the same topological structure are 'homeomorphic'.

Before category theory, group isomorphism was defined group-theoretically, homeomorphism topologically, and so on. The definitions are unified in the categorical one (see Category theory, introduction to for an introduction to the concepts and notation). In any category, arrows $f : A \to B$ and $g : B \to A$ are called 'inverse' to one another if $gf = 1_A$ and $fg = 1_B$. Objects *A* and *B* are isomorphic if there are inverse arrows between them.

Category theory generally defines objects only up to isomorphism. That is, a categorical property will not have a unique instance in a category A but all its instances in A will be isomorphic and any object isomorphic to an instance will be an instance. For example, a 'terminal object' in a category A is an object *T* such that each object of A has exactly one arrow to *T*. A category A may have any number of terminal objects or none. Suppose *T* and T' are two such. Then there are arrows $T \to T'$ and $T' \to T$, and they are inverse since 1_T is the only arrow from *T* to *T* and similarly for T'. Hence *T* and T' are isomorphic. Conversely if *T* is terminal and there is an isomorphism $T \to T'$ then every object *B* of A has a unique arrow $B \to T \to T'$ to T', so T' is terminal.

2 The elementary theory of the category of sets (ETCS)

The 'elementary theory of the category of sets' (ETCS) axiomatizes the category Set (see Category theory, introduction to §1). We give the axioms in the next section.

In ETCS a 'singleton' is any set terminal in Set. We pick one and call it 1. We define an 'element' *x* of a set *A* to be a function from 1 to *A*, $x : 1 \to A$. Composing with any $f : A \to B$ gives an element of *B*, $fx : 1 \to B$. Trivially, each singleton has exactly one element.

We define a 'product' of sets *B* and *C* to be a set $B \times C$ and functions $p_1 : B \times C \to B$ and $p_2 : B \times C \to C$ such that for any set *A* and functions $f : A \to B$ and $g : A \to C$ there is a unique $u : A \to B \times C$ with $p_1 u = f$ and $p_2 u = g$. We can use $\langle f, g \rangle$ to name *u*, so $p_1 \langle f, g \rangle = f$ and $p_2 \langle f, g \rangle = g$. Thus elements $\langle x, y \rangle$ of $B \times C$ correspond to elements *x* of *A* and *y* of *B*.

Now 1 is only defined only up to isomorphism, as is the product $B \times C$, p_1, p_2. This is no laxity on our part. If a set *S* has any property expressible in ETCS without using names then so does every set isomorphic to *S*. Thus 1 is

distinguished from other singletons only by its name. We can pick a product of *B* and *C* to call $B \times C,\ p_1,\ p_2$ but it is distinguished from other products of *B* and *C* only by its name.

The elements of an ETCS set are definite in number but without distinguishing properties. Each is merely an element of *S* and is itself and no other. Like Cantor's cardinals ETCS sets are distinguished only by cardinality and their elements are 'mere units' (see Lawvere 1994).

This is a point of controversy. In practice even in Zermelo-Fraenkel set theory (ZF) where sets can be uniquely defined we rarely bother to do so. We say 'Let *S* be a singleton' without saying which one. We speak of 'the product $B \times C$' without specifying its elements (that is, without choosing among the many ways to code ordered pairs $\langle b, c\rangle$ as sets in ZF). But some people claim this will not do in foundations (see Mayberry 1988).

Others favour such indeterminacy. Since Dedekind raised the issue for modern mathematics, some people claim mathematical objects should have only relevant properties. Natural numbers, say, should have only arithmetic properties. Every ZF set has non-arithmetic properties given by its particular elements. So on this view numbers cannot be ZF sets. But ETCS models of arithmetic have no irrelevant properties. So this view could say the numbers form an ETCS set (see Benacerraf 1965).

Specifically, 'recursion data' on a set *S* means an element *x* of *S* and a function $f : S \to S$. We define a 'natural number object' to be a set *N* with recursion data 0 and $s : N \to N$, called zero and successor, such that: for any recursion data *x*, *f* on any *S* there is a unique function $u : N \to S$ with

$$u(0) = x$$
$$u(sn) = f(u(n)) \text{ for all } n \in N$$

Provably in ETCS there are infinitely many different natural number objects but all are isomorphic. None has any properties but the shared ones which follow from the definition (see McLarty 1994).

A 'subset' of an ETCS set *A* is any one-to-one function $i : S \to A$, that is, a function such that for all elements *x* and *y* of *S*, $ix = iy$ implies $x = y$. An element *x* of *A* is a 'member' of *i* if there is some element *z* of *S* with $iz = x$. We often write $S \rightarrowtail A$ for a subset, leaving the function *i* implicit. A 'relation' between sets *A* and *B* is a subset $R \rightarrowtail A \times B$ of the product. If $\langle x, y\rangle : 1 \to A \times B$ is a member of the subset we say *x* and *y* stand in the relation *R* or we write *xRy*.

A 'power set' of a set *B* is a set PB and an internal membership relation $\in^B \rightarrowtail B \times PB$ which ties subsets of *B* to elements of PB as follows: for each set *A* and relation $H \rightarrowtail B \times A$ there is exactly one function $h : A \to PB$, and vice versa, such that for all *x* in *A*, an element *y* of *B* has yHx if and only if $y \in^B hx$. Through *H*, each *x* in *A* defines a subset of *B* containing all *y* with *yHx*. Then *hx* is the element of PB tied to that subset. Power sets are defined up to isomorphism.

Now take any natural number object *N* and choose a power set $PN,\ \in^N$ for it, and then a power set for PN, and so on for as many levels as we want to work with. From these we can construct sets of rational, real and complex numbers in the usual way of arithmetized analysis. From here on ETCS works very much like ZF.

Mathematical practice, or even the typical set theory chapter in a maths text, relies on too few details and too much abuse of notation to say whether it is using ETCS or ZF. It can be cleaned up in either system. Yet ETCS claims to begin closer to practice. The basic ZF devices of transfinite accumulation, and coding pairs and numbers as sets, serve foundations only and are forgotten in practice. The basic devices of ETCS (the category axioms, finite limits, universal constructions - see Mac Lane 1986) are used throughout mathematics.

3 ETCS axioms and toposes

The topos axioms are the category axioms (see Category theory, introduction to §1) plus these two:

(1) There is a terminal object 1, and any objects *A* and *B* have a product $A \times B,\ p_1,\ p_2$.
(2) Each object *B* has a power set $PB,\ \in^B$.

Products and power objects are defined as in §2, reading 'object/arrow' for 'set/function'. We do the same for natural number objects, and many toposes satisfy the further 'axiom of infinity':

(3) There is a natural number object *N*, 0, *s*.

The characteristic feature of Set is that each function is uniquely determined by its effect on elements:

(4) Given any *f* and *g* both $A \to B$, if for all $x : 1 \to A$ we have $fx = gx$, then $f = g$.

The ETCS axioms are the category axioms plus (1)-(4).

In general topos theory any arrow $f : B \to A$ may be called a 'generalized element' of *A*. We call an arrow $i : S \to A$ 'monic' if it is one-to-one for all generalized elements of *S*: for any object *T* and arrows $h : T \to S$ and $k : T \to S$, $ih = ik$ implies $h = k$. We call any monic $i : S \to A$ a 'sub-object' of *A*. The definition of subsets in §2 agrees with this in Set but not in general.

We say *i* is 'included in' another sub-object $j : P \to A$ if there is some $f : S \to P$ with $i = jf$. Trivially, $1_A : A \to A$ is monic and includes all sub-objects of *A*. Call it all of *A*. Every topos has an initial object ϕ, and for each *A* the unique $\phi \to A$ is monic and included in every sub-object of *A*. Call it empty. Any two sub-objects of *A* have an intersection, defined as the largest sub-object included in both. They have a union defined as the smallest including both. Each sub-object *i* has a negation (or pseudocomplement), defined as the largest sub-object whose intersection with *i* is empty.

The operations on sub-objects give each topos a natural logic. For details see Johnstone (1977: ch.5) or other introductions to topos theory. The law of noncontradiction holds in every topos since by definition the intersection of any sub-object with its negation is empty. In terms of logic, every formula $P \mathbin{\&} {\sim}P$ is false. But in many toposes the union of a sub-object of *A* with its negation need not be all of *A*, and so a formula $P \vee {\sim}P$ need not be true. The law of the excluded middle (LEM) fails in some toposes.

For example, in the topos Spaces every object has a spatial structure and every arrow has a derivative. There is an object *R* which we think of as the line. The arrows $R \to R$ are the classical differentiable functions on the real numbers. The line has a point 0, that is, an element $0 : 1 \to R$. So there is a sub-object $\{0\} {\to} R$ and its negation $\{x \neq 0\} {\to} R$. But the union $\{x | x = 0 \vee x \neq 0\}$ is not all of *R*. It is 'all of *R* except the cohesion at 0'. An arrow from this union to *R* may lack a derivative at 0 and even be discontinuous at 0 simply because it can be defined separately on the pieces $\{0\}$ and $\{x \neq 0\}$. So LEM fails in Spaces for the formula $x = 0$, among many others.

Heyting's first-order intuitionist logic is sound in Spaces as it is in every topos (see Intuitionism §7). It is not complete since in Spaces LEM holds for closed formulas. Every disjunction $P \vee {\sim}P$ with no free variables is true in Spaces. In Set the union of any subset and its negation is the whole set so LEM holds. Of course classical first-order logic is sound and complete in Set. Heyting's logic is complete in some toposes, and so for logic in toposes collectively.

The axiom of choice is false in many toposes. It is easy to see it must fail in Spaces. Consider the function $f : R \to R$ defined by $fx = x^3 - x$. For each *y* in *R* there is an *x* with $fx = y$ so if the axiom of choice held there would be a choice function $g : R \to R$ such that for each *y*, $f(gy) = y$. But the graph of *f* shows no such function *g* can be continuous everywhere (let alone differentiable), so no such function can exist in Spaces. In fact the axiom of choice fails in any topos where LEM fails, since it implies LEM (see Johnstone 1977 or other topos texts).

In another respect topos logic is not even formally intuitionistic. In the logic of any topos, for every object *A*, every formula with just one free variable of sort *A* defines a sub-object of *A*. Brouwer's philosophical misgivings about set formation find no reflection here.

When Grothendieck created toposes for applications in topology, algebraic geometry and number theory (see Category theory, introduction to §3) he paid no attention to intuitionistic mathematics, let alone to Brouwer's epistemology. And the theory today does not say reasoning must all be intuitionistic or constructive. Reasoning should be just as classical or constructive as will suit its context.

4 Radically categorical foundations

Lawvere offered ETCS as a logical foundation and to support an ontological claim. Since ETCS sets have no

determinate contents, ‘we seem to have partially demonstrated that even in foundations, not Substance but invariant Form is the carrier of the relevant mathematical information’. But ETCS is not his only logical foundation. For other purposes ‘a more satisfactory foundation will involve a theory of the category of categories’ (1964: 1,506, 1,510).

Lawvere (1966) axiomatized a ‘category of categories’. We call these axioms CCAF. They give general theorems of category theory without implying the existence of many specific categories. Lawvere gave various stronger axioms. Positing that Set exists is one. The axioms then give all the categories constructed from Set.

Another would be to posit a ‘category of all categories’ as one object in the CCAF universe which represents the whole universe. The set theory NF (see Set theory, different systems of §7) includes a set of all sets. It also has a category of all categories in the most naïve sense. But this set theory works so awkwardly with functions that the category of all categories lacks crucial properties (it is not Cartesian closed). Axiomatizing this does not seem promising. A more promising approach not yet much explored would use ‘fibered’ categories in the sense of Bénabou (1985).

The radically categorical position, though, does not lean on any one logical foundation. It says mathematical objects exist each in its own right. Given any type of structure one goal should be to describe it as intrinsically as possible, and the most intrinsic descriptions of structures to date are categorical. For example, axioms for the topos Spaces describe differential manifolds including the line *R* in their own terms. These axioms do not presume set theory or anything else. They are on a par with ETCS or ZF in giving a self-contained logical foundation for their subject. But axioms only organize our knowledge. Spaces, sets and more exist whether we axiomatize them or not.

If spaces are as real as sets in this sense, then the logic of Spaces is as genuine a logic as that of Set. This is the point of controversy over topos logic. The axioms for Spaces can be modelled in classical set theory. (Moerdijk and Reyes (1991) give many variants.) And Set can be modelled in Spaces (McLarty 1988). You cannot have one without the other. But you could claim the logic of sets is genuine logic while Spaces and other toposes give merely formal interpretations. The radically categorical position says otherwise: each topos (and other categories we do not go into here) has its own genuine logic.

Logical foundations can also describe relations between various branches of mathematics. It is useful in geometry to know how spaces relate to sets. Plus, modelling Spaces in Set and vice versa gives relative consistency results - the Spaces axioms are consistent if ETCS is and vice versa. Johnstone (1977: ch.9) gives relative consistency results for variants of ZF and ETCS. This can increase our confidence in all the axiom systems.

What no logical foundations can do, on this view, is give a starting point to justify the rest of mathematics. No such powerful axiom system is transparently consistent and there is no prospect of proving any one consistent (see Gödel’s theorems). The justification of mathematics rests on its whole place in our knowledge. All consistency proofs are relative consistency proofs.

Category theory, introduction to

A 'category', in the mathematical sense, is a universe of structures and transformations. Category theory treats such a universe simply in terms of the network of transformations. For example, categorical set theory deals with the universe of sets and functions without saying what is in any set, or what any function 'does to' anything in its domain; it only talks about the patterns of functions that occur between sets.

This stress on patterns of functions originally served to clarify certain working techniques in topology. Grothendieck extended those techniques to number theory, in part by defining a kind of category which could itself represent a space. He called such a category a 'topos'. It turned out that a topos could also be seen as a category rich enough to do all the usual constructions of set-theoretic mathematics, but that may get very different results from standard set theory.

1 Examples and the category axioms

Consider sets and functions. Write $f : A \to B$ to say *f* is a function defined on the set *A* and all its values are in the set *B*. Each set *A* has an identity function $1_A : A \to A$ with $1_A(x) = x$ for every *x* in *A*. Given any $f : A \to B$ and $g : B \to C$ there is a composite $gf : A \to C$ with $gf(x) = g(f(x))$ for all *x* in *A*.

Now consider a formal language with deductive rules. Let $f : A \to B$ say *f* is a proof whose sole assumption is the formula *A* and conclusion is the formula *B*. Each formula *A* gives a one-line proof $1_A : A \to A$ with *A* as assumption and conclusion. Proofs $f : A \to B$ and $g : B \to C$ concatenate to give $gf : A \to C$. We view a proof as transforming its assumption into its conclusion.

The features which are common to these two examples are widespread in mathematics. Category theory gives an axiomatic treatment of them. The category axioms speak abstractly of 'objects' and 'arrows': each arrow has an object as domain and another as codomain. We write $f : A \to B$ to say *f* is an arrow with domain *A* and codomain *B*. If the codomain of one arrow is the domain of another, as in the case of $f : A \to B$ and $g : B \to C$, then the arrows have a 'composite' $gf : A \to C$. Each object *A* has an 'identity arrow' $1_A : A \to A$. The axioms require that for any arrows $f : A \to B$, $g : B \to C$ and $h : C \to D$ we have $h(gf) = (hg)f$, $f1_A = f$ and $1_B f = f$.

Thus we have the 'category' Set, whose objects are sets and whose arrows are functions, and the category Proof, whose objects are formulas and whose arrows are proofs (see Lambek 1994). The axioms clearly hold for Set and for Proof. Other useful categories include: Top, with topological spaces for objects and continuous functions for arrows; and Group, with groups (as in abstract algebra) for objects and group homomorphisms for arrows.

Picture a category as a network of arrows between points. So Set is an infinite network with a point for each set and an arrow for each function. Each path of arrows connected head-to-tail has a composite going from the first point on the path to the last.

2 Working with categories

We can look at some simple categorical structures. An object *T* of a category A is a 'terminal object' in A if each object of A has exactly one arrow to *T*. An object *W* of A is a 'weak terminal object' in A if each object of A has at least one arrow to *W*.

Terminal objects of Set are singleton sets. Weak terminal objects of Set are non-empty sets. In Proof the weak terminal objects are the provable formulas. If *W* is provable with no assumptions then it is provable from any assumption. Nothing is provable in only one way, so Proof has no terminal object.

Reversing arrows in the definition of a terminal object defines an 'initial object': an object *I* of A such that each object of A has exactly one arrow from *I*. Similarly for a 'weak initial object'. A set is initial in Set if and only if it is empty, and is weakly initial on the same condition. No formula is initial in Proof. Inconsistent formulas are weakly initial.

These definitions deal only with patterns of arrows. Yet in Set and Proof they coincide with specific concepts such as non-emptiness or provability. Other definitions give richer structures such as Cartesian products or power sets

in Set, the several connectives in Proof, and topological or group structures in Top or Group. So category theory has a unifying role where one argument proves different theorems in different contexts. More importantly, it focuses on the relevant structural relations between objects, be they sets or spaces or whatever. To see this at work we ascend to transformations of categories, called ‘functors’.

We write $\mathbf{F} : \mathbf{A} \to \mathbf{B}$ to say F is a functor from the category A to the category B. This means that for each object *A* of A there is an object $\mathbf{F}A$ of B, and for each arrow $f : A \to A'$ of A there is an arrow $\mathbf{F}f : \mathbf{F}A \to \mathbf{F}A'$ of B, and F preserves identity arrows and composites. That is, for each *A* of A we have $\mathbf{F}(1_A) = 1_{\mathbf{F}A}$, and for any composite gf we have $\mathbf{F}(gf) = (\mathbf{F}g)(\mathbf{F}f)$. So F draws a picture of the network A in the network B.

Each category A has an identity functor $1_\mathbf{A} : \mathbf{A} \to \mathbf{A}$ with $1_\mathbf{A}(A) = A$ and $1_\mathbf{A}(f) = f$ for all objects *A* and arrows *f* of A. Functors compose in the obvious way. So categories and functors themselves are the objects and arrows of a category of categories (see Category theory, applications to the foundations of mathematics §4).

Functors were invented to focus on relevant structure. Since about 1900 homology theory has been central to topology. To simplify somewhat, by 1940 homology theory was a way of taking each topological space *S* and constructing from it a family of groups $H_n(S)$, one for each natural number *n*. By a further construction each continuous function $f : S \to S'$ between topological spaces gives homomorphisms $H_n(f) : H_n(S) \to H_n(S')$. So group theory could be used to prove theorems of topology. But there were many different ways to construct the groups. The subject was thriving and chaotic.

Eilenberg and Mac Lane looked away from constructing the groups $H_n(S)$ and saw homology instead as drawing the network of continuous functions in the network of homomorphisms. They saw each H_n as a functor $H_n : \mathbf{Top} \to \mathbf{Group}$. To do this they created category theory and wrote their classic paper, ‘The General Theory of Natural Equivalences’ (1945). Category theory is now the standard language for homology. It cleared away old complexities and made room for vast new ones.

The new homology (and related cohomology) spread to algebra and number theory taking category theory with it. Then category theory took other new directions. (Applications before 1970 are surveyed in passing in Mac Lane (1971).)

3 Toposes

Around 1960 Grothendieck attacked some famous problems in geometry and number theory. His project achieved its initial aims in 1973 with Deligne’s proof of the Weil conjectures, certain theorems concerning integer roots of polynomials (see McLarty 1990). For this project Grothendieck created ‘toposes’ (or, ‘topoi’). These were categories which he viewed as spaces. Every ordinary topological space can be represented by a topos but toposes are considerably more general than that. The topological method of cohomology can be applied to all toposes and thus Grothendieck defined the ‘étale’ cohomology that Deligne used. This cohomology is now central to number theory but not all its applications require toposes.

About 1970 Lawvere and Tierney gave first-order axioms which apply to all of Grothendieck’s toposes plus some other categories. Today we use ‘topos’ or ‘elementary topos’ to mean any model of the axioms, and ‘Grothendieck topos’ to mean one got by Grothendieck’s method. To a logician a topos is analogous to the universe of sets. In any topos the constructions of ordinary mathematics exist, but not always in classical form. Classical logic is not valid in all toposes.

The category Set is a topos. Classical logic is valid in it and it gives classical mathematics. But there is also a topos Eff in which all functions from the natural numbers to themselves are recursive. Classical logic would prove there are non-recursive functions; but classical logic is not valid in Eff. There is a topos Spaces in which each object has a spatial structure and each function is differentiable. This topos includes all the usual differentiable functions of calculus. Classical logic proves there are non-differentiable functions but it is not valid in Spaces. In any topos the valid logic is somewhere between classical and intuitionistic. This is uncontroversial as a fact in model theory. For controversy over its philosophical interpretation see Category theory, applications to the foundations of mathematics §4.

Cattaneo, Carlo (1801-69)

The figurehead of the Italian democratic movement prior to the unification of Italy, Carlo Cattaneo developed a theory of federalism as a practice of self-government, envisaging a United States of Italy. He identified the bourgeoisie as the most dynamic force in contemporary history and regarded scientific culture as the engine of progress. Often dubbed the first Italian positivist, he perceived empirical philosophy as a kind of synthesis of all the sciences, but also stressed its anthropological and psychological dimensions and above all its character as a methodology of knowledge; his objective was to study human thought. The great themes of Cattaneo's philosophy are nature, the individual and society; particularly the last.

Cattaneo represents the most progressive trends in Italian thought in the first half of the nineteenth century. He aimed to encourage the propagation of technical and scientific knowledge in his native Lombardy in order to equip the entrepreneurial class with the expertise necessary for economic development; and to this end he founded the journal, *Il Politecnico* (1839-44; 1851-63). Until 1848, Cattaneo had formed part of the legal opposition to the regime, but when Milan rose against the Austrians on 18 March of that year, Cattaneo took an active, leading role in the Five Days' Uprising. He was critical of the provisional government, however, and when the Austrians returned, left for Paris, where he published *L'Insurrection de Milan en 1848 (The Milan Uprising of 1848)*. Shortly afterwards, he left Paris for Switzerland, where he settled permanently in Castagnola, near Lugano. From his exile in Switzerland, Cattaneo voiced his often fierce opposition to the principal political currents in Italy, and forged a role for himself as the great 'prompter' and moving spirit of the Italian democrats, and the leading proponent of federalism against unitary solutions.

Partly as a result of the influence of the philosopher G.D.R. Romagnosi, from whom he inherited the notion of sociability as the foundation of civil society, Cattaneo insisted on the need to intervene practically to shape the reality of one's society. Associated with this basic principle were his profound mistrust of the notion of the solitary consciousness and stress on human action in all its aspects. Rejecting the 'four opposing exaggerations' of idealism, materialism, scepticism and mysticism,Cattaneo saw the human environment as containing a balance of material and ideal forces. He hoped that the kind of renewal that had taken place in the natural sciences could also be brought about in the human sciences.

Cattaneo regarded history as the history of peoples and civilizations. It might even be studied through the examination of languages: a method which Cattaneo employed in a new and often anti-Romantic manner. The perspective adopted in his great historical canvasses is that of liberal, bourgeois culture, in which social changes and transformations are possible and necessary, and social mobility contains subversive forces. At least until 1848, Cattaneo regarded England as the apogee of modern economic development and triumphant capitalism (*Della conquista d'Inghilterra pei Normanni (On the Norman Conquest)* (1839); *Alcuni Stati moderni (Some Modern States)* (1842)), even though he did not ignore the effects of colonialism and its abuses of power (*Dell'India antica e moderna (India, Past and Present)* (1846)). Progress, for Cattaneo, is made up of cultural graftings, of conflicts and exchanges of ideas and principles between different peoples and cultures. Social conditions are the source of good or evil. Not for nothing have some critics seen Cattaneo's famous *Interdizioni israelitiche (Israeli Interdicts)* of 1835 as containing the germs of historical materialism, in view of the importance he attributes there to economics as a factor in cultural development; while in his *Notizie naturali e civili sulla Lombardia (Notes on the Natural and Social History of Lombardy)* (1844) - perhaps his masterpiece - the portrait of a region becomes a model of historical method in its presentation of the dynamic interaction of the forces of economic interest and human intelligence.

Cattaneo's idealization of the Lombard bourgeoisie is just one aspect of his celebration of the bourgeoisie in general as the driving force of capitalism, within the context of which science and technology constitute the instruments of development and progress. Addressing himself to the problem of the origins of the Italian bourgeoisie, Cattaneo located them in the rise of the city, which interested him as the historically decisive force in the struggle against feudalism and as the catalyst for the whole process of socioeconomic development in Italy (*Della formazione e del progresso del Terzo Stato (On the Genesis and Development of the Third Estate)* (1854); *La città come principio ideale della istoria italiana (The City as the Ideal Origin of Italian History)* (1854). For

Cattaneo, urban life was the typical and distinctive embodiment of Italian culture; and the city was also the birthplace of scientific culture and of modern empirical thought. It was no coincidence, for him, that the Italian revolutionary movement of 1848 had its roots in the cities.

It has been remarked of Cattaneo that his thought oscillates between a conception of philosophy as a synthesis of the empirical sciences and, contrastingly, as an analysis of the human spirit. Philosophy needed to draw on science, but at the same time it needed to be a psychological and anthropological exploration of collective life. In his *Collective Psychology* (five lectures delivered at the Lombard Institute of Sciences between 1859 and 1865), he takes as his object of study that most social of human acts: thought. And social ideology, the subject of his Lugano lectures, implies a study of human society from a perspective which foreshadows that of modern anthropology. Cattaneo employs the notion of a ‘system’. A system may be closed, which is to say reactionary, or open and progressive; and it is the succession of one system by another that constitutes progress. In this way, Cattaneo develops the thought of Vico (§6) and integrates it with the notion of progress, the great common theme of eighteenth- and nineteenth-century writers.

During his exile, as he watched Italian society embark on a process of development very different from that for which he had hoped,Cattaneo abandoned political activism for the sphere of ‘opinion’ and ideas. He attached great importance to opinion-forming, which he regarded as essential as a means of combating the ignorance of the masses and preparing them for struggle on a national scale.Cattaneo’s thought can thus be distinguished from socialist positions in that he envisaged the problems of the rural and industrial proletariat being dealt with by the bourgeoisie itself.

When attempts have been made to trace the ideological antecedents of twentieth-century Italian culture, Cattaneo has often been identified as the ‘founding father’ of the anti-moderate tradition in recent Italian history, the great protagonist of Italian ‘anti-history’ and the most authentic example the nineteenth century provides of a dissenting intellectual.

List of works

Cattaneo’s writings were first published in his journal *Il Politecnico*.

Cattaneo, C. (1845) *Alcuni scritti (A Selection of Writings)*, Milan: Borroni & Scotti. (Contains *Della conquista d’Inghilterra pei Normanni (On the Norman Conquest)* (1839), *Alcuni Stati moderni (Some Modern States)* (1842) and *Dell’India antica e moderna (India, Past and Present)* (1846).)

Cattaneo, C. (1848) *L’Insurrection de Milan en 1848 (The Milan Uprising of 1848)*, Paris: Amyot.(Cattaneo’s personal account of the Milan Uprising, highly critical of the provisional government.)

Cattaneo, C. (1860) *Memorie di Economica pubblica dal 1833 al 1860 (Records of Public Economy from 1833 to 1860)*, Milan: Libreria F. Sanvito.(Contains *Ricerche economiche sulle interdizioni imposte dalla legge civile agli Israeliti (Economic research on the bans imposed by civil law on the Israelites)*.)

Cattaneo, C. (1948) *Scritti letterari, artistici, linguistici e vari (Writings on Literary, Artistic, Linguistic and Other Subjects)*, ed. A. Bertani, Florence: Le Monnier, 2 vols.(Essays and articles by Cattaneo on aesthetics, linguistics and other subjects.)

Cattaneo, C. (1949-56) *Epistolario (Collected Letters)*, ed. R. Caddeo, Florence: Barbera, 4 vols.(Cattaneo’s correspondence on a range of subjects.)

Cattaneo, C. (1950) *Scritti filosofici (Philosophical Writings)*, ed. N. Bobbio, Florence: Le Monnier, 3 vols.(This volume contains his lectures *Collective Psychology* (1859-65).)

Cattaneo, C. (1955) *Scritti economici (Writings on Economics)*, ed. A. Bertolino, Florence: Le Monnier, 3 vols. (Cattaneo’s writings on industry, capitalism and economic issues.)

(1957) *Scritti storici e geografici (Historical and Geographical Writings)*, ed. G. Salvemini and E. Sestan, Florence: Le Monnier, 4 vols.(The second volume contains *Notizie naturali e civili sulla Lombardia (Notes on the Natural and Social History of Lombardy)* (1844) and *Della formazione e del progresso del Terzo Stato (On the Genesis and Development of the Third Estate)* (1854).)

Cattaneo, C. (1964-5) *Scritti politici (Political Writings)*, ed. M. Boneschi, Florence: Le Monnier.(Cattaneo’s political writings.)

Cattaneo, C. (1968) *Scritti scientifici e tecnici, 1823-1848 (Scientific and Technical Writings, 1823-1848)*, ed. C.S. Lacaita, Florence: Giunti and Barbera.(Cattaneo’s technical and scientific writings.)

Cattaneo, C. (1972) *Opere scelte (Selected Works)*, ed. D. Castelnuovo Frigessi, Turin: Einaudi, 4 vols.(A selection of Cattaneo’s major writings in a range of subjects.)

Causality and necessity in Islamic thought

Discussions of causality and necessity in Islamic thought were the result of attempts to incorporate the wisdom of the Greeks into the legacy of the QurČamp;lsquo;'an, and specifically to find a philosophical way of expressing faith in the free creation of the universe by one God. Moreover, that article of faith was itself a result of the revelation of God's ways in the free bestowal of the QurČamp;rsquo;'an on a humanity otherwise locked in ignorance, which a purportedly Aristotelian account of the necessary connection of cause and effect might be taken to rule out. Thus free creation of the universe and free gift of the Qur'an formed a logical unit. The challenge, therefore, was to compose an account of metaphysical and ethical matters which permits rational discourse about them, without obscuring their ultimate source or precluding divine action in the course of world events and human actions.

*The scheme of emanation elaborated by al-Farabi sought to give 'the First' the place of pre-eminence which the Qur'an demanded for the Creator, but did so by modelling creation on a logical system whereby all things emanated necessarily from this One. It was this necessity, further articulated by Ibn Sina, which al-Ghazalii took to jeopardize the freedom of God as Creator and as giver of the Qur'an. al-Ghazali's objections were honed by a previous debate among Muslim theologians (*mutakallimun*), who had elaborated diverse views on human freedom in an effort to reconcile the obvious demand for free acceptance of the Qur'an with its claims regarding God's utter sovereignty as Creator over all that is. Natural philosophy was also affected by these debates, specifically with regard to the ultimate constitution of bodies as well as accounts that could be given of their interaction. However, the primary focus was on human actions in the face of a free Creator.*

1 Metaphysical issues

The understanding of causality that prevailed among the classical Islamic philosophers was decidedly Neoplatonic in character (see Neoplatonism §3). Intellectual coherence was assured by a scheme of emanation itself modelled on the necessity inherent in a logical system. Thus the connections between events shared in the connections between propositions that followed logically from one another. In this fashion, al-Farabi's emanation scheme offered a cosmic pattern for all causality as well as a master metaphor for causal interaction (see al-Farabi §2). All that is and all that happens was conceived as depending, for its being and its intelligibility, ultimately on the first cause (or 'the One') by way of intermediary influences which are cosmic in character yet linked together by an intellectual inherence assuring necessary linkage between cause and effect. Aristotle's ideal of 'scientific explanation' in the *Posterior Analytics* could only have been projected, after all, if the world itself was so constructed that things and events were properly connected with one another so as to form a coherent whole (see Aristotle §3).

That is the sense to be made of Ibn Sina's division of 'being' into 'necessary being' and 'possible being', with 'necessary being' restricted to the One from which all the rest emanates while the remainder is characterized as 'possible in itself yet necessary by virtue of another' (see Ibn Sina §5). In this way the order of the natural world is assured, since it derives from the one principle of being in a way that is modelled on logical derivation. In this way also, the necessity of causal interaction becomes virtually identical with that of logical entailment, thereby linking the entire universe in a necessary order with the first cause. Furthermore, the pattern of logical entailment extends to the action of that first cause as well: the universe comes forth from it necessarily, as premises from a principle.

Such a model for causal activity cannot be easily imported into a world believed to be freely created by one God. The order described by the emanation scheme threatened the hegemony of the God revealed in the Qur'an, by removing the freedom of that God to reveal as well as to create. Accommodation with Neoplatonic thought required too much by way of concession from believers in the Qur'an, and it was only a matter of time before this effort to harmonize creation with emanation was challenged. That challenge came notably from al-Ghazali, whose frontal attack, entitled *Tahafut al-falasifa (The Incoherence of the Philosophers)* was in turn countered by Ibn Rushd in his *Tahafut al-tahafut (Incoherence of the Incoherence)*. But while Ibn Rushd's defence of a repristinated Aristotle would continue to influence Western thought, al-Ghazali's spirited attack succeeded in virtually marginalizing such philosophical reflection on metaphysical matters in the Islamic world to the activities of an elite who would come to be known as 'the philosophers', and whose adherence to Qur'anic faith would often be

suspect.

2 Human action and divine action

If such quasi-logical necessity attributed to causality in the universe ran counter to the freedom of the divine agent, it also threatened by implication the freedom of human beings to respond to divine revelation; and such freedom is clearly presupposed by the very structure of the Qur'an, which calls constantly for a response to its warnings and means to elicit wholehearted response to the guidance it offers (see Islamic theology §3). Yet the controversy here was not carried out on the terrain staked out by the philosophers but rather among expressly religious thinkers (called *mutakallimun* because of their desire to articulate the faith by way of argument). The earliest among these, the Mu‘tazilites, could only see their way to securing human freedom by considering free human actions as utterly autonomous, and so as the creations of human agents, not of God. These early Islamic thinkers fashioned their position on such matters without benefit of the later philosophical reflections noted above, and appear to have conflated notions of origination, causation and creation in an effort to assure that humans bear complete responsibility for the actions for which they will be rewarded or punished. Their concern was for justice, as it can be applied to human beings and to the God of the Qur'an.

Again, however, to withdraw a sector of creation from the purview of the creator of heaven and earth, and to insist that human actions be our creation and not God's, could hardly be sustained in Islam. The challenge this time came from one of the theologians' own number, al-Ash‘ari, who shared their conceptual conflations; he developed a purportedly intermediate position, whereby human actions are *created* by God yet *performed* by us. The key notion introduced was *kasb* (or *iktisab*), which attempts to distinguish responsibility for one's actions from their sheer origination. Originating in the marketplace to describe transactions, it alludes to the fact that actions which God creates are ‘acquired', or perhaps better, ‘performed' by human beings as created agents (see Ash‘ariyya and Mu‘tazila §§1, 5).

While this position obviates the removal of human actions from the domain of God's creation, it seems to complicate unduly the issue of human agency and responsibility. The conceptual question turns on the extent to which the notion of ‘agent' can be used of both creator and creature. Can there be an authentic agent other than the creator?

This is a question, of course, which touches every religious tradition which avers the free creation of the universe by one God: how does the first cause relate to other causes? Indeed, can there even be other causes in the face of a sovereign ‘First'? The response of *kalam* thinkers to this question was complicated by their commitment to an atomistic metaphysics, which seemed designed to remove all causality other than the divine from the realm of nature: this is the celebrated ‘Islamic occasionalism'. Later, however, the question was debated by al-Ghazali without reference to any such metaphysical theses. Rather, the terms were those introduced by ‘the philosophers', turning on the necessity of the connections between events in nature, specifically between those which we recognize as causes and their effects. Clearly these connections could not be akin to logical necessity, or there would be no room whatsoever for miracles like the ‘descent' of the Qur'an; yet if the universe is the result of God's free action and not of necessity, the creator will continue to be free to act within creation. Thus the account given of causal agency in general, and of personal agency in particular, will have to allow for just that: a kind of agency proper to creatures, yet always subordinate to the influence of a free creator. al-Ghazali responds to this challenge by comprehending created causes under a patterned regularity of the *sunna Allah*, action willed by God: creatures do indeed contain such powers, yet always subject to the will of the One who so created them. In this way, a key Islamic religious thinker such as al-Ghazali can simultaneously insist that God alone is the only agent and yet, by God's power, others are agents as well. Thus causality can be attributed to creatures, but not causal connections of the quasi-logical sort demanded by the emanation scheme.

3 Natural philosophy

Early *kalam* thinkers, as noted above, presumed an atomistic conception of nature by which the universe was divinely sustained by being freely created at ‘each moment' by God. This conception is clearly an attempt to affirm the omnipresence of divine causal action in the universe God creates, and just as clearly evacuates created causal efficacy. It also runs foul of Aristotle's refutations of atomism in terms of the irreducibility of the continuum of time, space and matter to discrete moments (see Atomism, ancient). It is these arguments which

persuaded al-Ghazali that the Ash‘arite presumption of the atomistic constitution of nature was gratuitous and unnecessary as a ploy to assure the omnipresence of the creator’s action in nature. Thus Islamic thought has not been caught between the two extremes of ‘occasionalism’ (whereby all action is effectively God’s) (see Occasionalism) and the pervasive necessity associated with the Neoplatonic emanation scheme of its notable philosophers; there is a middle course, intimated by al-Ghazali and explicitly developed in the early twentieth century in Egypt in the celebrated Qur’an commentary *al-Manar*, whereby the *sunna Allah* is evoked to explain the consistency of a created world of nature.

In summary, Islamic thought must always reconcile the assertion that the entire universe is the free creation of God, who neither requires anything in order to create it nor stands to gain anything by creating it, with the fact that this created world has a consistency associated with causes and effects as we observe them and as we use them to explain natural phenomena. If that causal consistency is articulated in terms which presume a necessity inimical to the free action of a creator, either in the beginning or at any moment of the universe’s duration, then Islamic thinkers will feel constrained, as some indeed have, to deny created causality in favour of divine sovereignty. However, as might be expected, developments internal to Islamic thought on this matter have found a way of affirming the free creation of the universe together with its causal consistency, and in doing so have suggested a pattern for causal connections in nature which distances them from the quasi-logical while respecting their reality, specifically by invoking an analogy with the patterns which the God who reveals the Qur’an sets up between human actions and their recompense: the *sunna Allah*. In this way the world of nature can be seen to have a consistency proper to it, yet at the same time is affirmed to be the result of an intentional agent whose order it reflects in the operations proper to it (see Intention §4). The pattern to be found by scientific investigation will be a reflection of that with which the natural world has been endowed by its creator: the celebrated *ayat*, or ‘signs’ of divine wisdom and ordering available to human reason.

Causation

Two opposed viewpoints raise complementary problems about causation. The first is from Hume: watch the child kick the ball. You see the foot touch the ball and the ball move off. But do you see the foot cause *the ball to move? And if you do not see it, how do you know that that is what happened? Indeed if all our experience is like this, and all of our ideas come from experience, where could we get the idea of causation in the first place?*

The second is from Kant. We can have no ideas at all with which to experience nature - we cannot experience the child as a child nor the motion as a motion - unless we have organized the experience into a causal order in which one thing necessarily gives rise to another. The problem for the Kantian viewpoint is to explain how, in advance of experiencing nature in various specific ways, we are able to provide such a complex organization for our experience.

For the Kantian the objectivity of causality is a presupposition of our experience of events external to ourselves. The Humean viewpoint must find something in our experience that provides sufficient ground for causal claims. Regular associations between putative causes and effects are the proposed solution. This attention to regular associations connects the Humean tradition with modern statistical techniques used in the social sciences to establish causal laws.

Modern discussions focus on three levels of causal discourse. The first is about singular causation: about individual 'causings' that occur at specific times and places, for example, 'the cat lapped up the milk'. The second is about causal laws: laws about what features reliably cause or prevent other features, as in, 'rising inflation prevents unemployment'. The third is about causal powers. These are supposed to determine what kinds of singular causings a feature can produce or what kinds of causal laws can be true of it - 'aspirins have the power to relieve headaches' for example.

Contemporary anglophone work on causality has centred on two questions. First, 'what are the relations among these levels?' The second is from reductive empiricisms of various kinds that try to bar causality from the world, or at least from any aspects of the world that we can find intelligible: 'what is the relation between causality (on any one of the levels) and those features of the world that are supposed to be less problematic?' These latter are taken by different authors to include different things. Sensible or measurable properties like 'redness' or 'electric voltage' have been attributed a legitimacy not available to causal relations like 'lapping-up' or 'pushing over': sometimes it is 'the basic properties studied by physics'. So-called 'occurrent' properties have also been privileged over dispositional properties (like water-solubility) and powers. At the middle level where laws of nature are concerned, laws about regular associations between admissible features - whether these associations are deterministic or probabilistic - have been taken as superior to laws about what kinds of effects given features produce.

1 Hume's legacy

The chief historical locus for the attack on causation is the work of David Hume, which is based on the associationist theory of concept formation that he shared with Locke and Berkeley. Ideas for Hume are either copies of sensory impressions or built out of other ideas, themselves copies of sensory impressions, by simple association. Sensory impressions are of the way things look, taste, feel and sound (see Hume, D. §2). We can have sensory impressions of redness and of hardness, of sourness and shrillness, but not of necessity or causality. Whence come these ideas then? In our experience events of one kind regularly follow those of another. By association we are led to expect the second when we experience the first. It is our impression of our own state of expectation that provides the idea of necessity or of causation. So the idea of causation, according to Hume, is a copy of an impression not of a feature of events in the outside world but of events that take place within us.

Hume therefore steered agnostically away from the direct question 'what is causality?', holding that the right answer (if there is one) must be unintelligible to us. Instead he asked what makes us believe in causal connections and what state of mind is such a belief. Much twentieth-century 'Humeanism' about causation is not so Hume-like as is often implied.

Hume's positive account has been developed in two different directions. The first attempts to analyse causal claims

as claims about regular associations between sensible qualities (or others deemed acceptable) in the external world. The second bases causality in our particular ways of representing the world. A popular version of this looks not to how we represent the world but to how we intervene in it (Von Wright 1993): roughly, we regard as causes those kinds of features that we can manipulate. This idea needs careful formulation if it is to account for our usual causal discourse; for example, it is standardly assumed that craters on the moon cause their shadows but not the converse, though we typically manipulate neither.

As we have seen, Hume’s theory of the one-to-one association of impressions and ideas lies at the heart of his answer to the second central question about causality, the question about the relation between causings and other ‘less problematic’ features of the world. This theory is also central to his answer to the first question about singular causation. There is no impression of one feature causing another, hence no corresponding idea about the world. What then about the world makes a singular causal claim true? The most that can be said is that we believe causal claims at the first level - that of singular causation - when they are instances of second-level claims - about causal laws - which in turn we believe when we meet with regular associations between sensible properties. The only facts that matter about the individual case are that the cause precedes the effect and is spatiotemporally contiguous with it. If in addition there is something about the world that makes effect follow cause we can have no comprehension of it and *a fortiori* no knowledge. Sometimes later accounts try to avoid the assumption that causes precede their effects in order to leave open the question of backward causation; other even aim to reduce claims about temporal order to ones about causal order (Reichenbach 1956) (see Time §4; Relativity theory, philosophical significance of §3). But this has proven difficult to do.

The associationist theory of concept formation central to Hume’s account has been entirely abandoned in twentieth-century philosophy. But his conclusions have not. Modern day defenders of Hume’s theses face three challenges:

(1) Explain why singular causal facts are less legitimate than noncausal facts like ‘the cat was on the mat’.
(2) Show that no causal facts are required to make sense of those features counted as unproblematic and explain what makes these features superior.
(3) Produce a regularity account of causal laws that either accords with or corrects our usual judgments and the uses to which we put them.

The answers to questions (1) and (2) tend to be based on epistemological or methodological considerations: causal facts are so much harder to find out about than the privileged alternative that they can have no place in the known or intelligible world. This answer had a special grip in the heyday of sense-data when facts about our ‘internal’ experiences - which purportedly do not include causal facts - were supposed to be incorrigible. The construction of a reasonable sorting criterion is a more delicate job nowadays when it is widely assumed that nothing is incorrigible and the defence of any single claim will generally require a wealth of knowledge including some laws of nature. Similarly judgments about intelligibility are more difficult at a time when no theory of meaning seems entirely acceptable.

2 Kant’s reply

In *Critique of Pure Reason* (1781/1787), Kant argued that our minds impose the category of causality on the otherwise unorganized manifold of sensory experience, and by this imposition constitute the external world of objects causally interacting within a uniform space and time. Therefore we have a priori assurance that all changes in the phenomenal world proceed in accordance with causal laws which we can discover by observation and experiment (see Kant, I. §§4-7).

Kant rejected Hume’s suggestion that the mind is always passive in forming its expectations and that all our empirical beliefs arise from the association of ideas. The principle of determinism - that every event in the natural order is the effect of some cause - is a necessary truth because it is the presupposition of any experience of an objective world of things. Without this constraining principle we could not distinguish, as we in fact do, between the subjective order of our perceptual experience and the objective order of events in nature. Hume insisted that the proposition that nature is throughout regulated by causal laws could not itself be derived from experience and he was right to do so, according to Kant. This proposition is rather the necessary presupposition of all experience of objects existing in an objective temporal order. We cannot but think of nature as the domain of universal laws

valid for all observers.

3 Mill's empiricism

John Stuart Mill was an empiricist. He believed that all knowledge - even knowledge of mathematics - derives from experience. But he did not share Hume's concern about the idea of causation; nor did he embrace a regularity account of causal law. What occurs in nature is the consequence of a vast number of jointly acting causes. Seldom does any particular arrangement of causes stay in place long enough for regular behaviour to appear. Even if it were to, the regularity would not match with the causal laws we most need to know - laws about what each cause contributes separately.

In many domains there will be laws of this kind. In mechanics, for example, we can find the law governing the force due to gravity and that governing the force due to electricity. Mill called these 'tendency laws' because they tell what the cause contributes, or 'tends to do', but do not describe the effect that actually occurs (here, the 'total' force). What the cause tends to do and what it actually does would coincide exactly were the cause in a position to operate alone. The idea of a tendency law makes sense in mechanics because there is a well-defined rule for the composition of causes: when causes act together, the actual force produced is the vector sum of the forces ascribed to each individually by the basic tendency laws. Chemistry is different: when a cause acts jointly with another it may have no systematic relationship to what it does when the other is absent. In Mill's opinion political economy is like mechanics, not like chemistry.

Mill was concerned not with what causes are but with the proper empiricist question of how we find out about them. He was keen on the experimental method but realized that in many domains experiment is impossible. For these he articulated 'Mill's methods' which involve looking for factors that are present and absent in tandem with the effect and that co-vary in magnitude with it. These methods are a qualitative precursor to modern statistical techniques for confirming causal hypotheses from naturally occurring data (see Statistics and social science §3). In political economy, where he supposed the fundamental driving factor to be behaviour resulting from 'the economic motive', Mill argued that basic causal laws can be found by looking inside ourselves at our motives and actions (Economics, philosophy of §3).

4 Logical positivism

Like various reductive empiricisms inspired by Hume, the logical positivism of the Vienna Circle also eschewed causes (see Logical positivism §4; Vienna Circle §3). Causal talk, according to Rudolf Carnap, imperspicuously casts in the material mode claims that properly belong in the formal mode: it looks as if we are talking about things in the world when instead we are talking about our representations of it. Causality for logical positivism became derivability: 'C causes E' if E can be derived from C in our representation of the world; that is, if we accept that all cases of C are cases of E. The account, however, was beset by problems about accidental regularities. 'All coins in my pocket are silver' does not ground a causal connection. So some notion of necessity or lawlikeness has generally been admitted: 'all Cs are *by law* Es'. Still whatever is involved in separating lawlike from accidental regularities has been supposed to be far weaker than a full-fledged concept of causation (see Laws, natural §2).

This account has obvious counter-intuitive results, pinpointed in an example by Sylvan Bromberger (1966). Given the angle of the sun and the laws of geometrical optics, from the height of the flagpole the length of its shadow can be derived - and the converse. Yet surely the height of the pole causes the length of the shadow and not the reverse. For staunch positivists this argument illustrates what is wrong with causal talk - it postulates differences in the world where in fact there are none. For others it constitutes a *reductio ad absurdum* of the reductivist/positivist position.

If strict derivability under universal laws is too weak as a stand-in for causal laws, it is also too strong, as C.G. Hempel admitted in his *inductive-statistical* model of explanation: E can be explained by (or accepted on the basis of) C if we admit as law that the probability of E given C is high, even though the association is not 100 per cent (see Explanation §2). (Many would find the expression 'as law' redundant here for they take probability, as opposed to finite frequency, to be already a modal notion.) The move to less-than-universal associations is motivated not only by the irreducibly probabilistic nature of quantum associations but also because we could admit few explanations indeed in either the natural or the social sciences if universal (deterministic) association is

demanded.

But high probability does not work either, as Michael Scriven argued with the example of paresis, which arises only in the last stages of syphilis. The probability of paresis given syphilis is low. Nevertheless when paresis occurs, syphilis is clearly the cause. This suggests that increase in probability is a better requirement: C causes E just in case the probability of E is higher than C than without.

Over and above these problems it is well-known that ‘correlation is not causation’. Two kinds of cases illustrate. First, joint effects of a common cause are generally correlated with one another. For example, there is an anti-correlation between eating candy and getting divorced. But low candy consumption in a given period does not cause divorce during that period; rather, ageing is responsible for both. Second is a case due to Wesley Salmon *et al.* (1971). A box contains either of two radioactive elements, L and H, but never both. Each element produces W particles, L at a lower rate than H. L causes the presence of Ws in the box: if this situation persists L will predictably (or necessarily) produce Ws. Yet L may reduce the probability of W since the presence of L is correlated with the absence of even more effective cause H. Indeed, with a little care in the choice of the levels of intensity of L and H, the presence of L will raise the probability of W being present (see Determinism and indeterminism; Explanation §4).

The example suggests that there may be no universal rule for connecting probabilistic associations with causal laws although there may well be correct case-by-case connections. In the radioactivity case, the fact that Ls predictably cause Ws, plus facts about the situation, explain why the probability of W given L is exactly as it is. If one adopts some form of inference to the best explanation, the probabilities - whatever they are - will be evidence for the causal law (see Inference to the best explanation). Moreover, given sufficient collateral information it is possible to deduce from the probabilistic facts that Ls produce Ws in this set up. (Although uncommon in the social sciences, this kind of ‘bootstrapping inference’ that allows the deduction of the hypothesis from data, given general background assumptions and other information specific to the situation, is familiar in experiments in physics.) Causality may after all be an umbrella notion with different criteria in different contexts.

5 Causal laws

By this point, it seems, the logical positivist account that locates the truth of causal-law claims in our representations of the world has merged with the Hume-inspired account that locates their truth in laws about regular associations. The difference between them depends on whether one talks about the regular associations we accept in our scientific theories - laws of science - or about laws of nature. Nevertheless they share the insistence that there must be a universal rule that connects causal laws and the laws of association, since neither tradition is willing to admit any concept of causation that cannot be reduced to facts they find less problematic. It remains to produce such a rule. The most promising attempts, originally formulated by Patrick Suppes (1970, 1973), try to restore increase in probability as the true sign of causality.

In both the candy-eating and radioactivity examples, the putative cause and the putative effect are each correlated with a third factor that is itself a cause of the putative effect. Candy consumption and divorce are correlated with age, which causes increase in divorce levels; L is correlated with H, itself a cause of W. Stratification is often used to control for features like age or the presence of other materials that may confound the correlations we expect between a genuine cause and its effects. The proposal then is that ‘candy consumption prevents divorce’ is true just in case candy consumption lowers the probability of divorce in subgroups where everyone is the same age. But what features should be used for stratification? Mathematically, correlations between C and E may appear and disappear if we stratify along any third variable correlated with both. The most natural choice is to use all and only other factors - like age - that are themselves causes of E.

Besides the obvious question of how exactly this suggestion should be formulated, the proposal faces three problems. First, in cases where a cause may produce two effects in tandem - cases of the production of products and by-products for example - joint effects may still be correlated with each other even though we look only at stratified subpopulations in which the cause is present to the same degree.

Second, the proposal abandons the programme of replacing causal laws with law-like regularities. Probabilistic associations may still help with causal inference, but only in so far as one has a great deal of causal information to begin with: no causes in, no causes out.

Third is the problem of validating the proposal - this one or any other. All available validations (Simon 1971; Spirtes, Glymour and Scheines 1993) put strong constraints on what kinds of causal relationships are possible among a set of variables as well as on the general relationship between causal laws and probabilities. Thus the task for those who wish to maintain some single situation-independent connection between causal laws and laws of associations is either to generalize these kinds of validations to cover laws or to produce convincing reasons why other kinds of cases are impossible.

The task for those who wish to reduce causal laws to probabilistic associations (Papineau 1993) is even more difficult, as can be seen by considering results of groups working with Clark Glymour and Peter Sprites and with Judea Pearl (1988). These provide the most systematic treatment available of causal inference from probabilistic information. In this work, for a given set of variables it is assumed that both a causal structure (a set of causal laws satisfying certain conditions like asymmetry) and a probability measure over the variables exist and some plausible constraints are assumed to hold between the probabilities and the causal structure. It is then possible to generate the set of all causal structures consistent with any particular set of observed probabilities given the constraints. For most cases, however, the causal structure is not unique. The probabilistic associations do not seem enough to fix the causal laws. This is the problem of the flagpole and the shadow reasserting itself again after a long detour.

Alternative conclusions can be defended. The results are sympathetic to the view that causal laws do not reduce to laws of association but are rather about what kinds of singular causal events happen predictably or by law. On the other hand the results fit with a programme of locating the choice among different causal structures consistent with the same probabilities in facts about our perspective or our interests, or even with the claim that causal talk is hopelessly underdetermined and nothing fixes what we should say. And of course there is the project of articulating further constraints so that the probabilistic associations fix the causal laws uniquely. What definitely can be concluded is that no reduction of causal-law claims to claims about law-like or necessary associations has yet been achieved, let alone the stronger Hume-inspired view that causal-law talk can be reduced to claims about associations that employ no concepts of law or necessity at all.

A final outstanding problem for any account is to link the analysis of what causal claims say with our usual methods for confirming them. The regularity accounts described previously relate readily to standard techniques based on Mill’s methods for the use of population data. The connection to results of controlled experiments is less clear (Cartwright 1995). Yet these are supposed to be our surest methods for causal inference; indeed so much so that some have taken causal-law claims simply to be claims about the results that would be obtained from controlled experiments (Holland 1986) (see Experiment; Scientific method).

6 Singular causal claims

Singular causal claims may be true because of singular causal facts. Two much discussed problems seem to presuppose this. First is ‘overdetermination’: two factors, each by law sufficient for an effect, occur and the effect ensues. Which is actually responsible? The second is ‘causal pre-emption’: a cause occurs sufficient by law to bring about an effect but a second cause intervenes and produces the effect first (Menzies 1996). Both problems suggest that there is more to causation in the single case than reductive empiricists and logical positivists allow. Yet some resist, feeling that this claim is unintelligible. The challenge they pose is to ground this claim in some plausible theory of meaning that will support their intuition.

Others reject singular causal facts because they find no grounds for judgments about them. To this writers like G.E.M. Anscombe (1971) reply that we can see the cat lapping up the milk as well as we can see anything! This defence is supported by theories of perception in which the ability to judge correctly that something has any feature at all by seeing it depends on having a good deal of collateral knowledge, including knowledge of both singular causal facts and causal laws. There are in addition, especially for causal processes in physics, accounts of singular causation in terms of other features conventionally admissible, such as energy interchange (Salmon 1984; Dowe 1992). It is also argued that the operation of a cause often leaves traces that can be used to determine its occurrence.

The question of whether there is significantly more to singular causation than lawful association is different from the question: for every singular causal fact is there a law that it can be brought under? Donald Davidson (1980) replies ‘yes’ to this latter question, and the same answer is presupposed by J.L. Mackie (1980), who takes causes

to be INUS conditions - insufficient but non-redundant parts of unnecessary but sufficient conditions. Mackie's account supposes that there are general laws of the form

$$E \equiv (C_1^1 C_1^2 \ldots C_1^n) \vee (C_2^1 C_2^2 \ldots C_2^m) \vee \ldots \vee (C_p^1 C_p^2 \ldots C_p^k).$$

This allows us to focus on one of the contributing components, C_i^j, as the cause of interest in a given context, even though this component alone is not sufficient. (However it does not capture Anscombe 's denial that causes must be sufficient for their effects since she has in mind purely probabilistic or chance causation: could we not have a cause that is enough for the effect and yet the effect fail?) Some considerations of how to characterize properties enter here: if this C that is supposed to have caused an E is not doing what it does regularly, what makes it a C? But the usual arguments are epistemological: how could we know that a C caused E if this fact neither falls under a causal law nor is the expression of a known causal power? For instance, how could we count a factor as a trace if there were no law ensuring that the operation of the cause generally produces this factor as a side-effect?

Midway between the view that there are singular causal facts and reductivist/positivist doctrines is the counterfactual account (Lewis 1986): roughly, C caused E just in case if C had not occurred E would not have. One task is to formulate this correctly, especially to avoid problems of overdetermination and pre-emption and to ensure that one effect of a common cause does not count as cause of a joint effect. The second task to explain is counterfactuals (see Counterfactual conditionals). One common attempt offers a possible-world analysis. The counterfactual is true if in the nearest possible world where E fails, C fails too. Possible worlds are generally taken to be worlds which have the same laws as our own, except for small miracles to allow C to fail. On one reading possible worlds are mere calculational devices: one function maps from laws and non-causal facts to a set of structured descriptions ('the set of possible worlds'), and a second takes the set of descriptions plus the counterfactual in question into either 'true' or 'false'. Singular causal claims would then turn out to be indirect ways of talking about laws and non-causal facts, and the logical positivist programme would be in part borne out. If, however, the ontology of possible worlds plays a genuine role, the challenge is to defend the advantage of possible worlds over singular causal facts. A similar challenge must be met by probabilistic accounts of singular causation that use special notions of probability like single-case propensities (Eells 1991): why are these better than the cat's lapping up the milk?

7 Causal powers

The idea of a causal power or a disposition (Harré and Madden 1975) is closely bound to notions of potentiality and possibility related to the notions of necessity that reductive empiricists and logical positivists find unintelligible. They understand only claims about what occurs, or perhaps what occurs by natural law, not about what can occur by natural law. Proponents of causal powers often counter that there is no distinction between powers or dispositions and occurrent properties (Mellor 1971, 1991, 1995). Objects have properties and by virtue of having these properties they have the power to do a variety of things; otherwise the notion of property makes no sense. Perhaps properties are just nexus of causal powers (Shoemaker 1984). This raises the question of whether an object could have a particular power all on its own without thereby having any other usually related features (see Primary-secondary distinction; Property theory).

For the most part, however, questions centre on the relation between causal powers on the one hand and causal laws and singular causation on the other. Some powers are, in Gilbert Ryle's terminology, highly specific or determinate (1949). They tend to be back-named from some episodic verb that is taken to describe their natural expression (as in 'soluble' and 'dissolve'). This suggests a one-to-one correspondence between powers and laws. Aspirins have the power to relieve headaches just in case, by law, aspirins properly administered relieve headaches. Talk of powers then seems otiose.

The matter appears differently when more generic powers are considered. 'Electrons repel other electrons' describes a power that can be harnessed to produce an indefinite variety of different law-like behaviours in different situations; situations can even be rigged in which electrons reliably, by repelling other electrons, cause them to move closer. One can restore the one-to-one correspondence by inventing or choosing an appropriate episodic verb, though the attempt can seem strained. (As Ryle urges, grocers sell tea, wrap butter and weigh bacon. But do we want to say that grocers groce?) Nor does this unproblematically serve the reductivist/positivist purpose of rendering talk about powers as talk about laws, for is not 'repelling electrons' in the situation where they move

closer a specific case of 'exercising a power'? The relationship between powers and the indefinite and un-inventoriable class of laws that express them thus remains a central philosophical concern.

Causation, Indian theories of

*Causation was acknowledged as one of the central problems in Indian philosophy. The classical Indian philosophers' concern with the problem basically arose from two sources: first, the cosmogonic speculations of the Vedas and the Upaniṣads, with their search for some simple unitary cause for the origin of this complex universe; and second, the Vedic concern with ritual action (*karman*) and the causal mechanisms by which such actions bring about their unseen, but purportedly cosmic, effects. Once the goal of liberation (*mokṣa*) came to be accepted as the highest value, these two strands of thought entwined to generate intense interest in the notion of causation. The systematic philosophers of the classical and medieval periods criticized and defended competing theories of causation. These theories were motivated partly by a desire to guarantee the efficacy of action and hence the possibility of attaining liberation, partly by a desire to understand the nature of the world and hence how to negotiate our way in it so as to attain liberation.*

Indian philosophers extensively discussed a number of issues relating to causation, including the nature of the causal relation, the definitions of cause and effect, and classifications of kinds of causes. Typically they stressed the importance of the material cause, rather than (as in Western philosophy) the efficient cause. In India only the Cārvāka materialists denied causation or took it to be subjective. This is unsurprising given that a concern with demonstrating the possibility of liberation motivated the theories of causation, for only the Cārvākas denied this possibility. The orthodox Hindu philosophers and the heterodox Buddhists and Jainas all accepted both the possibility of liberation and the reality of causation, though they differed sharply (and polemically) about the details.

*The Indian theories of causation are traditionally classified by reference to the question of whether the effect is a mode of the cause. According to this taxonomy there are two principal theories of causation. One is the identity theory (*satkāryavāda*), which holds that the effect is identical with the cause, a manifestation of what is potential in the cause. This is the Sāōkhya-Yoga view, though that school's particular version of it is sometimes called transformation theory (*pariṇāmavāda*). Advaita Vedānta holds an appearance theory (*vivartavāda*), which is often considered a variant of the identity theory. According to the appearance theory effects are mere appearances of the underlying reality, Brahman. Since only Brahman truly exists, this theory is also sometimes called* satkāraṇavāda *(the theory that the cause is real but the effect is not).*

*The other principal theory of causation is the nonidentity theory (*asatkāryavāda*), which denies that the effect pre-exists in its cause and claims instead that the effect is an altogether new entity. Both adherents of Nyāya-Vaiśeṣika and the Buddhists are usually classified as nonidentity theorists, but they differ on many important details. One of these is whether the cause continues to exist after the appearance of the effect: Nyāya-Vaiśeṣika claims it does, the Buddhists mostly claim it does not.*

Finally, some philosophers try to take the middle ground and claim that an effect is both identical and nonidentical with its cause. This is the position of the Jainas and of some theistic schools of Vedānta.

1 The context of the Indian theories

The commitment to the ideal of liberation (*mokṣa*) provides the context for understanding the classical Indian philosophers' concern with causation. Typically the theoretical problem of Indian philosophy is to provide an account of the world which allows for the possibility of our successfully entering into it as agents set on liberation from suffering (*duḥkha*). In order to guarantee the feasibility of liberation we need to be assured that there are reliable causal connections between events and actions such that it is possible for a person to enter into the course of events as a conscious agent whose actions have predictable consequences. To do this the Indian philosophers sought to identify those causal chains relevant to liberation, and to analyse the nature of the causal relation as exhibited among the members of those chains.

There are a number of such causal chains proposed. One of the oldest and best known is the Buddhist chain of dependent origination (*pratītyasamutpāda*). This twelvefold chain runs: ignorance; dispositions; consciousness; body and mind; the six sense fields; sense contact; sensation; desire; clinging; becoming; birth; old age and death. Each of these factors is both conditioning and conditioned. This is expressed in a traditional Buddhist formula

characterizing the relation between the links: ‘When *A* is, *B* is; *A* arising, *B* arises; when *A* is not, *B* is not; *A* ceasing, *B* ceases.’ The possibility of liberation (called *nirvāṇa* in Buddhism) requires that we be able to break the chain at certain points where the links are only necessary conditions for what follows. In Buddhism the favoured weak links are ignorance (*avidyā*) and desire (*tṛṣṇa*), which can be eliminated with (respectively) knowledge and nonattachment (see Suffering, Buddhist views of origination of).

The alternative causal chains of the Jainas, of Nyāya-Vaiśeṣika and of Sāōkhya-Yoga differ in their details. However, all include ignorance as a link and hence guarantee the possibility of liberation through the possibility of the elimination of ignorance by right knowledge. It is essential for the possibility of liberation that the causal chains which bind us to suffering are such that at least some of the members are necessary but not sufficient conditions for other members, otherwise we could not enter the chain and reverse our condition of bondage. On the other hand, the chain must not have gaps, for if there is no necessary connection between the links none of our actions can be relied upon to bring about the goal of liberation. Thus once we have identified the causal chain that leads to bondage, we also need to say something more about the nature of the causal relation itself.

Two basic models dominate Indian thinking about the nature of the causal relation. One is the model favoured by the identity theory of Sāōkhya-Yoga. A standard illustration is the case of milk and curds: the milk is the cause and the curds are the effect. But the milk is the same stuff as the curds; one is merely transformed into the other. Generalizing from this kind of example leads to the view that the effect pre-exists in its cause. In fact a cause and its effect are not two separate, discrete entities but instead two states of the same enduring substance. The major difficulty with this model (in both its Sāōkhya and Advaitin versions) is that the causal relation threatens to be too strong. If nothing can become other than what it is already, how can we unenlightened beings ever achieve our own liberation?

The competing model of the causal relation is the one favoured by the nonidentity theory of Nyāya-Vaiśeṣika and (some) Buddhists. A standard Naiyāyika illustration is the pot and its two halves: the two halves of the pot are its causes and the pot is the effect. (Indian potters make a pot by first making two halves and then joining them.) According to this model the effect is not pre-existent in the cause. Effects are instead conceived of as wholes inhering in pre-existing parts which are the causes.

The Buddhist versions of the nonidentity theory are rather different because Buddhism generally denies that there are any persisting substances at all; everything is momentary. A standard illustration is the way in which whirling a flaming torch creates in watchers the impression of a persistent object: a circle of fire. Similarly, the momentary occurrences of things in certain patterns create the impression of persisting objects existing in the world.

Both versions of the nonidentity theory claim to avoid the error of making the causal relation too strong, for effects are not identical with their pre-existing causes. They also both claim to avoid making the causal relation too weak, for both in their different fashions try to guarantee the regularity of causal relations. However, to vindicate the latter claim each school has to develop a rather elaborate ontology and epistemology, the details of which come in for criticism from other schools.

A third position tries to occupy the middle ground between the identity theory and the nonidentity theory. This is the stance taken by the Jaina theory of nonabsolutism. According to this theory there is a variety of aspects any entity can be viewed from. Thus from one viewpoint the effect is pre-existent in the cause and from another viewpoint it is not. The theory attempts to provide a compromise account of the causal relation that is neither too strong (as the identity theory threatens to be), nor too weak (as the nonidentity theory threatens to be).

Common to all of these causal theories, however, is the assumption that causation is real and not merely subjective. This is natural enough, since all these theories accept the original problematic: how to analyse the nature of the causal chain so as to guarantee the feasibility of attaining liberation. The one exception to this in Indian philosophy is to be found in the views of the Cārvāka materialists. These philosophers were sceptics about both causation and the possibility of attaining liberation. They espoused an antireligious materialism and a subjectivist account of causation as being merely observed conjunctions of events.

We can arrange, then, the Indian theories of causation in the following sequence. First, we have Cārvāka scepticism about causation, with its attendant scepticism about the possibility of liberation. All the other theories can be represented as various defensive responses to this scepticism. Thus the identity theory seeks to guarantee

the possibility of liberation with an account of causation that makes it a very strong relation. Two distinct versions of the theory are developed: the transformation theory of Sāõkhya-Yoga and the appearance theory of Advaita Vedānta. The nonidentity theory, on the other hand, tries to preserve the possibility of liberation while making causation a rather weaker relation. Again, two versions of the theory are developed: the Nyāya-Vaiśeṣika theory and the Buddhist theory of conditioned origination. The Jaina theory is an attempted synthesis of the identity and nonidentity theories.

2 Cārvāka scepticism

As antireligious materialists, the Cārvākas had no interest in vindicating the possibility of liberation (see Materialism, Indian school of §4). And as strict empiricists in their epistemology, they refused to admit anything but perception as a valid means of knowledge. Accordingly they refused to admit causation as an invariable and unconditional relation. All we can know is what we perceive and all we perceive are conjunctions of events, not a dependence relation between events. These conjunctions may be regarded as purely accidental: hence their views are sometimes known as accidentalism (*yadṛcchāvāda*). Rather than supposing some things are effects dependent on other things which are causes, the Cārvākas held that it is more reasonable to suppose things occur because of their own natures (*svabhāva*): hence their views are sometimes called naturalism (*svabhāvavāda*).

This sceptical position was criticized by all the other schools. The most common criticism was of the overly restrictive epistemology that led to this sceptical result. Indeed, the Cārvāka position was often viewed as a *reductio ad absurdum* of its strict empiricist premises. Accordingly the response of the other schools was usually to try to develop from a less restrictive epistemology a more generous ontology which included causal relations.

Another common complaint, however, was that Cārvāka scepticism was self-refuting. One Naiyāyika version of this charge claims that the scepticism about causation is refuted by the sceptics' own behaviour: they purport to doubt the causal relation between fire and smoke, but light a fire when they want to produce smoke. Of course, the Cārvāka might just reply here that we are so constituted psychologically that we expect a uniform regularity between instances of fire and smoke. Notwithstanding this, there is no real justification for the expectation; it is just a habit of expecting what has previously occurred in certain circumstances to reoccur in similar circumstances. But for the liberation-oriented philosophers, the Cārvāka's philosophical anthropology here is far too pessimistic. The agent trapped in the patterns of habit is paradigmatically the unliberated being; liberation is freedom from such bondage and understanding the causal chains which lead to bondage also allows us to discover the route to freedom.

3 Sāõkhya-Yoga and the transformation theory

Sāõkhya-Yoga espouses the identity theory (*satkāryavāda*), so called because it holds that an effect (*kārya*) is already existent (*sat*) in its cause in a potential form. The Sāõkhya version of the theory is also called transformation theory (*pariṇāmavāda*) because it holds that the cause undergoes a real transformation into its effect through the causal process.

The standard Sāõkhya arguments for the identity theory presented in Īśvarakṛṣṇa's *Sāõkhyakārikā (Verses on Distinctionism)* (verse 9) are basically that something cannot emerge out of nothing, that the effect must be of the same material as the cause and that specific causes can only produce specific effects. In order to guarantee all of this the effect must pre-exist in the cause; it is a modification of what was already present. Thus according to the metaphysics of Sāõkhya the manifest world must have an existing cause that the effect pre-exists in. This is nature (*prakṛti*), conceived of as a unitary principle underlying observable phenomena, which are transformations of this substance. The self (*puruṣa*) is merely the passive witness of all this.

The key Sāõkhya examples of causation all involve material causation: as when a seed grows into a plant, or milk is transformed into curd, or oil seeds into oil. In these cases a cause and its effect are plausibly just two states of a single continuing substance. The Naiyāyikas objected that the Sāõkhya theory abolishes the distinction between material and efficient causes. But this is not quite true, for Sāõkhya-Yoga also admits another type of cause: the efficient or instrumental cause (*nimittakāraṇa*). However, this is not supposed to act upon the material cause and transform it into an effect. Rather it simply removes the barriers which check the material cause (*prakṛti*) from transforming from a relatively unmanifested state to a more manifested state. The *Yogabhāṣya* (4.3) compares it to

how a farmer allows water to flow from a filled bed to another just by removing the obstacles.

The transformation theory insists that there is a necessary relation between cause and effect. To this extent it responds to the Cārvāka sceptical challenge to the possibility of liberation: there is indeed an invariable concomitance between cause and effect, since the latter is just a manifested state of the former. But the theory threatens to make the causal relation too strong. Transformation theory holds causation to involve a real transformation of a common stuff. But then nothing can become other than it is already and the presently unenlightened can never attain liberation. Sāōkhya-Yoga responds to this objection by developing a radical dualism between nature (*prakṛti*) and self (*puruṣa*). The self is essentially unaffected by the causal transformations of *prakṛti*. As the *Sāōkhyakārikā* (62) startlingly puts it: 'No one, therefore, is bound; no one released, likewise no one transmigrates. Only *prakṛti* in its various forms transmigrates, is bound and is released'. Because the *puruṣa* is just pure, contentless consciousness it cannot be bound or liberated. Realizing the absolute separation of *prakṛti* and *puruṣa*, ceasing to misidentify ourselves with our bodies, we come to appreciate our true natures as pure consciousnesses. This realization leads to liberation (called *kaivalya* in Sāōkhya-Yoga), a condition apart from all suffering. The difference between bondage and liberation, then, is not an ontological one, but an epistemological one. The removal of the epistemological condition of ignorance is sufficient for liberation (see Sāōkhya).

4 Advaita Vedānta and the appearance theory

The Sāōkhya epistemological model of the route to freedom has much in common with the Advaitin approach to the problem. However, the Advaitin view came to be called appearance theory (*vivartavāda*), for it differs importantly from the Sāōkhya-Yoga version of the identity theory. In particular, the transformation theory views an effect such as a pot as a genuine transformation of the clay which constitutes it; both cause and effect are real. By contrast, the appearance theory views the effect (the pot) as not real, but only an appearance (*vivarta*). This is because Advaita espouses a radical monism: only the Absolute (Brahman) is real and the Self (*ātman*) is identical with Brahman (see Brahman; Monism, Indian). Accordingly the Advaitin theory of causation is a version of the identity theory in that the effect (the illusory world around us) is in a sense not different from its cause (Brahman/*ātman*). However, the effect is ultimately unreal, though the cause is real (thus the theory is sometimes called *satkāraṇavāda*, 'existent-cause-theory').

It is only on the level of phenomenal reality, then, that the Advaitins are willing to defend the identity theory. The Advaitin philosopher Śaōkara, for instance, endorses on this level the familiar Sāōkhya arguments that otherwise anything might come of anything and that clearly nothing comes of nothing. He also adds others of his own, including the suggestion that since the perceptibility of cause and effect are not independent it is reasonable to suppose they are identical. But ultimately, when we consider the relation between the world and Brahman, the effect is merely an *apparent* effect. This is because the Advaitins accept both that Brahman is an eternal being and that an eternal cause must have eternal effects. But since worldly phenomena are clearly not eternal, they conclude that they cannot be genuine effects of Brahman, merely illusory or apparent effects. In so far as Brahman underlies these appearances, however, it can be viewed as the material cause of the world. This is in accord with the Advaitin theory of perceptual error, according to which there must be something real that underlies a false appearance.

On the appearance theory, then, causality is an apparent relation between a (comparatively) unreal effect and a (comparatively) real cause, between a thought construction and that which grounds such a construction. The focus of the theory of causation thus shifts away from a concern with external relations between objects to a concern with the epistemic or awareness relation involved in such constructions. Accordingly liberation is conceived of epistemically as the realization of what one already essentially is: Brahman.

Clearly this theory of causation is only as plausible as the concept of Brahman as pure being upon which it rests. But this latter notion was vigorously rejected by many other Indian philosophers and the appearance theory thus requires a controversial monism to support it. Moreover, the identity theory's attempt to guarantee the causal relation, begun by Sāōkhya and continued by Advaita, seems to end up with too strong an account of causation. The only way out of this difficulty is to insist that, in some sense, we are already liberated but do not know it. Then liberation becomes an epistemological matter, not an ontological one. But with bondage no longer conceived in material terms, we have a corresponding drift both away from epistemological realism and towards metaphysical dualism or monism.

5 Nyāya-Vaiśeṣika and the nonidentity theory

Nyāya-Vaiśeṣika represents a robust commitment to both epistemological realism and metaphysical pluralism (see Nyāya-Vaiśeṣika). The Naiyāyikas define a cause as an invariable and independently necessary antecedent of an effect. That is, the causal relation is a uniform temporal relation that is necessary in the sense that there can be no counterinstances (though the relation is not a logical one in the Western sense). Moreover, the constant conjunction involved is a relation between properties, rather than between particular events.

Nyāya recognizes three kinds of causal factor: inherent cause (*samavāyikāraṇa*); noninherent cause (*asamavāyikāraṇa*); and instrumental cause (*nimittakāraṇa*). The inherent cause is that substance in which the effect abides by the relation of inherence. Thus the pot-halves or the threads are the inherent causes of the pot or the cloth because the latter effects inhere in the former causes. Note that for Nyāya the halves or the threads are not that out of which the pot or the cloth are composed. Rather the effects inhere in the cause so that, for instance, the cloth is not produced *out of* the threads, but subsists *in* the threads.

The noninherent cause is a cause which (directly or indirectly) inheres in an inherent cause. For example, in the production of a pot, the pot-halves are the inherent cause of the pot and the contact between the pot-halves, which inheres in the pot-halves, is the noninherent cause of the pot.

The first two kinds of causal factor are together necessary but not sufficient to produce an effect. The category of instrumental (or efficient) cause lumps together all the remaining causal factors. These include the agents of actions and other supporting factors.

The Nyāya theory takes the effect to be an absolutely new thing. The Sāōkhya argument that a nonexistent effect cannot be brought into existence is dismissed by the Naiyāyikas as confusing an absolute nonentity (like the hare’s horn, which is nonexistent for all time) with what is merely nonexistent before a particular time (like the pot before it is produced by the potter).

Nyāya also rejects the Sāōkhya argument that since not just anything can produce anything, there must be a necessary relation between cause and effect requiring that they coexist contemporaneously. The Naiyāyikas claim the relevant necessity is supplied by the fact that the relation is between universals, not particulars.

Essential to the Nyāya theory is the notion of inherence (*samavāya*). Inherence is the relation that connects wholes and parts (like pots and pot-halves, threads and cloth); it also connects substances and their qualities. Inherence is defined as the relation between two inseparable things related as located to locus. Inherence explains the relation of the pot to the pot-halves which are its material cause without falling into the identity theory’s mistake of identifying the effect with its cause (and hence being unable to explain why the effect does not come into existence as soon as the cause does). Moreover, inherence relates the self (*ātman*) to its qualities, including wrong notions. This allows for the wrong notions to be destroyed without thereby destroying the self, thus guaranteeing the possibility of liberation.

The most popular objection to the Nyāya theory is the infinite regress argument against inherence: if two entities *A* and *B* are to be related by the inherence relation *R*, which is itself a distinct entity, then it is also necessary that *A* and *R* be related by a different inherence relation *R**, itself a distinct entity. But then, of course, *A* and *R** have to be related by a yet different inherence relation *R***, and so on *ad infinitum*.

The Naiyāyikas reply that there is no regress because there is no other relation to connect inherence to its relatum. Clearly they cannot mean that the relatum and its relation are identical, for then, by the transitivity of identity, *A* would not only be identical with *R*, but also with *B*! Instead Navya-Nyāya (‘New Nyāya’, the later school of Nyāya) appeals to the notion of a self-linking connector (*svarūpasambandha*). The idea here is that while *A* requires the inherence relation *R* to connect it to *B*, *A* can be its own connector to *R*.

6 Buddhist theories

The Buddhists reject the Nyāya version of nonidentity theory because it seems to them that inherence is too strong a relation for causation. This is because the Buddhist theory of momentariness (*kṣaṇikavāda*) implies that there can be no persisting relation between any two entities, nor any persisting entities (see Momentariness, Buddhist

doctrine of). Instead they espouse an ontology of momentary events, each of which is causally efficacious, grouped into various patterns. Moreover, the theory of dependent origination is understood to imply that an effect is not the result of a single cause, but of many causes working together. The Buddhist schools attempted various classifications of this totality of causes and conditions.

The Abhidharma analyses reality into elements (*dharmas*) (see Buddhism, Ābhidharmika schools of). A distinction is also admitted between a *dharma* and its characteristics (*lakṣaṇas*). But this distinction quickly leads to a quasi-substantialism in the Sarvāstivāda school, as the concept of a *dharma*'s enduring essence or 'own-nature' (*svabhāva*) is introduced as the bearer of a *dharma*'s 'own-characteristics' (*svalakṣaṇa*). The concept of *svabhāva* is utilized by the Sarvāstivādins to explain the continuity of phenomena, which are analysed into momentary existences: one aspect of a *dharma* changes while another (the *svabhāva*) remains unchanged. This idea is used to explain the connection between cause and effect: a mango seed gives rise only to a mango tree because of the unchanging essence of 'mango-ness' that is in the seed and which connects the seed and the tree. Thus *svabhāva* is a kind of underlying substratum of change, a quasi-substance.

The Sautrāntikas rejected this theory as incompatible with the Buddha's doctrine of 'no-self', for to say a thing arises from its 'own-nature' is just to say it arises from the self. Instead the Sautrāntikas held existence to be but a series of successive moments. A seed is but a series of such point-instants and the seed-series gives rise to the tree-series in the sense that the latter succeeds the former. Causality, then, is just contiguity or immediate succession. But what of the origin of the series themselves? The Sautrāntikas maintain that the seed-series, at one time nonexistent, comes into existence: that is, the effect does not pre-exist.

Hence the Sarvāstivādins, with their appeal to a quasi-substantial essence, end up with a causal theory that threatens to become a Buddhist version of the Sāōkhya identity theory. The Sautrāntikas, on the other hand, espouse a Buddhist version of the nonidentity theory which fails to provide for any kind of necessity in the causal relation. Either way the possibility of liberation is not guaranteed: the first account is too strong, the second too weak.

This situation provides the context for the Mahāyāna developments. The Yogācārin idealists give up the reality of the external object and join the drift away from epistemological realism (see Buddhism, Yogācāra school of §§1-4). But the Mādhyamikas take a different line, exemplified in the celebrated critique of causation by the second-century Buddhist philosopher Nāgārjuna in his *Mūlamadhyamakakārikā (Fundamental Verses on the Middle Way)* (see Buddhism, Mādhyamika: India and Tibet). Nāgārjuna refers to and rejects four types of causal theory: (i) self-causation; (ii) external causation; (iii) both (that is, self- and external causation); and (iv) noncausation. The first type of theory includes the Sāōkhya identity theory; it also includes the Sarvāstivādin theory. The second type includes the Nyāya nonidentity theory; it also includes the Sautrāntika theory. The third is the Jaina theory. The fourth is the Cārvāka theory.

In a virtuoso dialectical display Nāgārjuna argues that the first option is absurd since it supposes the production of what already exists. The second option is absurd because the cause cannot be totally extraneous to its effect, or anything might cause anything. The third option is also untenable, since it just combines the first two options. The fourth option is unacceptable because it implies randomness and the inefficacy of action.

The last claim makes it clear that Nāgārjuna does not deny causation *per se*. Rather causality is interdependence: that is, all things are on a par, dependent on one another. Accordingly everything is empty (*śūnya*) of an independent essence. But all the causal theories criticized understand causation as an asymmetrical dependence relation with one relatum self-existent and hence more real. Instead, the Buddha's teaching of dependent origination is that everything is interdependent, and this is equivalent to the truth of emptiness (*śūnyatā*), that nothing has any self-existence or essence. Liberation is the realization of this emptiness (see Buddhist concept of emptiness).

7 Jaina nonabsolutism

The Jainas also agree that everything is interdependent. However, they insist too that it is still possible to distinguish the more real from the less real. Jaina nonabsolutism (*anekāntavadā*) is the theory that everything in the world has various aspects which permit everything to be seen from various viewpoints (see Manifoldness, Jaina theory of). With respect to causation this means that cause and effect are partly identical and partly

nonidentical. A cause has a power (*śakti*) to produce an effect and from this viewpoint the effect is pre-existent in the cause. But the effect is a new substance *qua* its form and from this viewpoint the effect is not pre-existent in its cause. This explains both why a particular effect can only be produced from a particular cause and why an extra effort is necessary to bring about that effect. Thus a pot is pre-existent in the clay in so far as its matter is concerned, but not in so far as its shape is concerned. The potter's effort is required to shape the clay into a pot.

The Jaina view seeks, then, to combine the merits of both the identity and nonidentity theories, while avoiding the difficulties of each. The theory is also very close to the identity-in-difference (*bhedābheda*) theories of certain theistic Vedāntins. The major difficulty with the theory from its opponents' point of view is that it just doubles the trouble by trying to have things both ways. To the extent that the Jaina theory of causation is a version of the identity theory, the causal relation is too strong to guarantee the possibility of liberation; to the extent that it is a version of the nonidentity theory, the causal relation is too weak.

Cavell, Stanley (1926-)

Born in Atlanta, Georgia, Stanley Cavell has held the Walter M. Cabot Chair in Aesthetics and the General Theory of Value at Harvard University since 1963. The range, diversity and distinctiveness of his writings are unparalleled in twentieth-century Anglo-American philosophy. As well as publishing essays on modernist painting and music, he has created a substantial body of work in film studies, literary theory and literary criticism; he has introduced new and fruitful ways of thinking about psychoanalysis and its relationship with philosophy; and his work on Heidegger and Derrida, taken together with his attempts to revitalize the tradition of Emersonian Transcendentalism, have defined new possibilities for a distinctively American contribution to philosophical culture. This complex oeuvre is unified by a set of thematic concerns - relating to scepticism and moral perfectionism - which are rooted in Cavell's commitment to the tradition of ordinary language philosophy, as represented in the work of J.L. Austin and Wittgenstein.

1 Criteria and scepticism

Cavell's Ph.D. dissertation (later published, much revised, as *The Claim of Reason* (1979)) elaborates an unorthodox interpretation of the notion of a criterion - pivotal for both J.L. Austin and Wittgenstein as that which is elicited by their method of responding to philosophical confusions with reminders of 'what we say when', of how we apply words in the circumstances of everyday life. Cavell's position resembles orthodoxy in conceiving of criteria as fixing a word's grammar by linking it to other words in a schematism that aligns language with the world and users of those words with one another. However, he takes the precise extent of this linguistic community as something philosophical exploration helps to determine, not something it can take for granted; and he takes the capacity exercised in such explorations to be a species of self-knowledge rather than knowledge of a predetermined body of rules, since a word's complex grammatical schematism sets real but inherently flexible limits to its projectibility into new contexts of use, and so requires an ineliminably personal evaluation of the mutuality of words and world in specific contexts.

Cavell further argues that Wittgensteinian criteria go deeper than Austinian ones, by showing that grammatical reminders cannot be used to refute scepticism in the manner favoured by Austin and many Wittgensteinians (see Criteria; Scepticism). Wittgensteinian criteria are criteria of identity rather than of existence; they specify what it is for something to count as a certain kind of thing, thus determining the applicability of a concept and making possible the judgments which deploy it, but they do not and could not determine the correctness of any such judgments. In this sense, sceptical denials that we can be certain of the existence of the external world or of other minds embody a truth; but they misrepresent this truth, since if criteria are not a species of knowledge-claim, they can no more be doubtful than they can be indubitable. Nevertheless, criteria so understood cannot be grounded in evidence or argument, but solely in our agreeing in their continued use; so the possibility of a sceptical refusal of that agreement is ineliminable. Since, however, our capacity to use words presupposes some such agreement, its sceptical refusal must result in emptiness - in the sceptics' saying something other than they take themselves to mean, or in saying nothing whatever. Accordingly, scepticism must be combatted not by claiming that the repudiation of criteria is impossible or irrational, but by demonstrating its true cost.

That cost turns out to be high. In so far as criteria distinguish phenomena from one another, their repudiation amounts to transforming the world into an undifferentiated plenum. And in so far as they give expression to human interests in phenomena, marking out the distinctions which matter to us and so our shared responses to the world, their refusal amounts to a denial that the world matters, that its phenomena are of interest. But why, then, might such costs seem worth bearing? How can otherwise competent speakers come to relinquish the mastery of grammar which governs their everyday intercourse when under the pressure to philosophize? Any answer partly depends on which criteria are subject to repudiation; the needs and interests served by affirming a fantasy of the essential privacy of language are not those served by an emotivist fantasy of morality. But at its most general, the sceptical impulse refuses criteria as such - the conditions of human knowledge and meaning; and Cavell's claim is that the sceptic in us all is motivated by the sense that such conditions are constraints, that the limits of sense (that which makes thought and knowledge possible) are in fact limitations (perspectival blinkers imposed on an otherwise unmediated knowledge of the world). In other words, criteria are rejected in the name of a fantasized perspective on reality which transcends all limits, a view from nowhere; scepticism is a refusal of the conditioned

nature of human knowledge, a denial of human finitude in the name of the unconditioned, the inhuman. But of course, nothing is more human than the desire to deny one's own humanity.

2 Literature, cinema and psychoanalysis

For Cavell, then, Wittgenstein's later philosophy aims at overcoming a variety of manifestations of scepticism in philosophy - scepticism understood not simply as an intellectual doctrine, but as the modern inflection of a perennial human impulse that finds expression in domains regarded as distinct from that of philosophy. By interpreting the repudiation of criteria as bringing about the death of the world and our interest in it, Cavell links Ordinary language philosophy with the concerns of Romanticism, in both its English and German forms - particularly the writings of Coleridge, Wordsworth and the Schlegels. He also interprets Shakespeare's plays and certain genres of Hollywood movie as responding to sceptical struggles, by following out the fates of human beings caught up in relationships in which scepticism about other minds is lived out and presented as exemplary of scepticism in general (see Other minds). The human capacity to revive self and world by recovering an interest in the latter's autonomous yet environing life is there figured by the capacity of these couples to acknowledge one another as separate and yet related; the vicissitudes of their weddedness to one another symbolize the vicissitudes of human weddedness to the world.

For Cavell, these readings are not literary illustrations of independently derived philosophical theses. Their focus on sceptical themes is rather understood to unsettle any received wisdom about divisions between philosophy and what lies outside it; and they are often Cavell's primary motivation for revising his more obviously philosophical investigations of these issues. For example, he takes his reading of *The Winter's Tale* to demonstrate that scepticism is inflected by gender; and the same reciprocity can be seen in his conception of the relationship between philosophy and psychoanalysis. Interpreting scepticism as a tragic repudiation of the humanity in oneself and others leads him to see Freud's attempts to recover human meaning from aberrant behaviour as a mode of overcoming scepticism, and to view the general psychoanalytic commitment to the reality of the unconscious mind as itself responding to Descartes' failure to refute scepticism by staking the mind's reality upon its existence as consciousness (see Freud; Descartes). At the same time, he utilizes Freudian theory to diagnose the motivational sources of confusions in philosophy; and he uses Freud's fundamental but politically fraught alignment of masculinity with activity and femininity with passivity (understood as two dimensions of, or orientations towards, human experience) to argue that the essential passivity invoked in the Wittgensteinian practice of recalling the true significance of one's words (as well as in Heidegger's emphasis upon *Gelassenheit*) embodies a specifically feminine mode of philosophical thought and expression.

3 Perfectionism and modernism

Cavell's vision of the human mind as torn between its active and passive sides, between scepticism and its overcoming, is further underpinned by reference to Emerson and Thoreau - and specifically by their perfectionist conception of the self as ineluctably split or doubled, as always capable of moving beyond the state in which it finds itself. When that capacity is active, the self embarks on an endless process of self-development, with each attained state neighbouring an attainable state that forms its possible future; when it is in eclipse, perhaps because of the attractions of one's attained state or by personal and social distractions from the draw of one's unattained state, the self's capacity to grow is also eclipsed - and losing one's capacity to change oneself in the name of a better state of self and society means losing an essential aspect of the self's autonomy: the capacity to revise one's conception of the good. As this formulation suggests, Cavell concludes that Emersonian perfectionism should form an essential dimension of Rawlsian (and more generally, of Kantian) liberal democracy, since a non-autonomous self cannot internalize the moral law which should govern relations with others in a liberal society (see Liberalism).

Cavell's work is a species of philosophical modernism. His writings relate themselves to a number of intellectual and cultural traditions by regarding their continuation as an undismissible problem. He can neither accept their prevailing paradigms as they stand, nor reject them as no longer philosophically and humanly meaningful; so he aims to inherit them by subjecting them to a radical but internal critique that can ultimately be grounded only upon his own (and his readers') willingness to acknowledge his words as worthy continuations of those traditions. This means that his writings are bound to appear idiosyncratic and self-regarding; but it also means that that appearance can no more justify their dismissal than it can guarantee their value.

Cavendish, Margaret Lucas (1623-73)

The only seventeenth-century woman to publish numerous books on natural philosophy, Cavendish presented her materialism in a wide range of literary forms. She abandoned her early commitment to Epicurean atomism and, rejecting the mechanical model of natural change, embraced an organicist materialism. She also addressed the relations that hold among philosophy, gender and literary genre.

1 Philosophical influences

Margaret Cavendish, Duchess of Newcastle, made contact with Hobbes, tutor to the Cavendish family, during the English Civil War. She became a member of the 'Newcastle Circle', which included Hobbes, Charleton and Digby, and which was influenced by interaction with Mersenne and Gassendi. While exiled in Paris, Rotterdam and Antwerp, she met Descartes and Roberval. In 1667, she became the first woman to attend a session of the Royal Society of London. She corresponded with Christian Huygens about 'Rupert's exploding drops', and with Glanvill about witchcraft and Neoplatonic notions such as 'plastic faculties' and the 'soul of the world'. She was one of the first Englishwomen to gain recognition for her publications. In additional to writing treatises such as *Philosophical Fancies* (1653) and *Philosophical and Physical Opinions* (1655, 1663) she experimented with a wide range of genres to express her views: poetry, orations, plays, autobiobraphy (*Nature's Pictures…*, 1656), biography (*The Life of ... William Cavindishe…*, 1667), allegories (*The World's Olio*, 1655), epistolary narrative (*CCXI Sociable Letters*, 1664a) and fiction (*The Description of a New World, called the Blazing-World*, 1668). Introduced to twentieth-century readers by Henry Ten Eyck Perry (1918) and Virginia Woolf (1925), her philosophy only came in for serious, sustained evaluation beginning in the 1980s.

2 Organicist materialism

Cavendish's earliest works, such as *Poems, and Fancies* (1653), combine a version of Epicurean atomism with Lucretius' strategy of using poetry to achieve the highest form of the good: intellectual pleasure (see Epicureanism §§3-5). But it is her *Philosophical Letters* (1664b), *Observations upon Experimental Philosophy* (1666), and *Grounds of Natural Philosophy* (1668) that present her mature natural philosophy. She attacks the Platonists' and hermeticists' postulation of incorporeals in their theory of natural change. She agrees with Hobbes that an incorporeal substance is inconceivable for 'natural reason', but concedes that, on the basis of faith, one might accept 'supernatural spiritual beings'.

Like Hobbes, she holds that all natural change is change of motion. But instead of mechanism, the model for change in her mature philosophy is one of vital agreement or sympathetic influence of parts, as within a single organism. For, she rejects Hobbes' principle: every motion in a body is produced by a contiguous body through impact. Rather, motion and vitality cannot be transferred from an external source, but are inherent in corporeal body. Cavendish rejects the transfer model of causation, which she thinks must underlie mechanical philosophy, for two main reasons. First, if motion is a mode of body, then it cannot be transferred outside of the substance in which it inheres. This would give to motion the unacceptable status of a 'real quality': a mere modification of substance that is none the less treated as if a 'complete thing'. Second, since motion is naturally inseparable from material body, if motion could be transferred, then a portion of body would be transferred too. But, since all change reduces to changes in motion, it follows that corporeal body would quickly be diminished. Cavendish here adapts a standard argument against atomism, cited by Lucretius.

Corporeal individuals, that is to say parts of body, can act on others at a distance because of their sympathy and vital agreement, just as a seriously wounded appendage can affect change in the organism as a whole. Cavendish is even committed to a version of panpsychism, whereby all corporeal individuals contain some degree of sense and reason (see Panpsychism). (In *De Corpore*, Hobbes admitted that he could not refute those who would ascribe sense to inanimate bodies.) She holds that corporeal nature is endowed with something analogous to understanding: Bodies know how to 'pattern out' the figure of a distant object in perception; they know how to duplicate themselves in generation. Her views - (1) that nature is a single, unified corporeal body, intrinsically possessing self-motion or vital force, (2) that all parts of corporeal nature have some degree of sense and intellect, (3) that causation is understood through the vital affinity one part of nature has for another, rather than via the mechanical model - are all adaptations from Stoicism. Cavendish appears to have been familiar with some version

of Chrysippus' views, for she makes reference to some of his analogies and arguments (see Stoicism §3; Chrysippus).

3 Theory of sense perception

Cavendish characterizes her anti-mechanist model of change in the following way:

> A Watch-maker doth not give the watch its motion, but he is onely the occasion, that the watch moves after that manner, for the motion of the watch is the watches own motion, inherent in those parts ever since that matter was…. Wherefore one body may occasion another body to move so and so, but not give it any motion, but everybody (though occasioned by another, to move in such a way) moves by its own natural motion.
>
> (Cavendish 1664b: 100)

She uses this vital concomitance model in her theory of sense perception: the 'corporeal motions' of external objects are the 'occasion' for the 'sensitive and rational motions' in creatures to imitate or 'pattern out' the motions and figures of the external objects. An 'occasion' is any circumstance which has no intrinsic connection to or direct influence on the effect, is not necessary for the production of the effect, but has an indirect influence on the production of the effect by inducing the primary cause through command or example. For Cavendish, a 'primary cause' is that which is necessary and sufficient for the production of the effect. An external object cannot be *necessary* for perception since 'the sensitive organs can make such like figurative actions were there no object present' (1668b: 56). But neither is it *sufficient*; when the sense organs operate 'irregularly', misperception of objects takes place. So, the sensitive body is the principal cause of perceptions, and external objects are the exemplar causes that induce the body to pattern out one sense perception rather than another.

Cavendish's main argument against Descartes and Hobbes on perception is that their talk of translation of motion, or of imprinting an image, can only be interpreted via a transfer model of causation. But, as has been shown, such a model is inconsistent with their substance/mode ontology. Cavendish also has specific criticisms of Hobbes' theory of memory that derive from Stoic arguments. If sense is produced by imprinting and if, as Hobbes suggests, the bodily organs retain these imprints, then mechanism entails an eventual jumble of corporeal images. This criticism, derived from Chrysippus, was also proffered by Digby and Glanvill. Hobbes would have charged his critics with interpreting his metaphors too simplistically, since the impressions he refers to are infinitesimal motions. But without the mathematical model later provided by the calculus, the only models in terms of which to depict the impact of infinitesimally small motions were crude mechanical ones. So, however quaint these criticisms may seem to us, they were contemporary demands for an intelligible mechanical model of perception.

4 Philosophy and gender

In 'Female Orations', a section of *Orations of Divers Sorts* (1662), Cavendish explores the following questions: Is woman's social subordination to man a fact or no? If the former, is it due to oppression by men, to a natural inferiority in women, or to unfair cultural practices such as inferior education and constricted possibilities for acquiring moral, physical and intellectual experience? Finally, is woman's subordination to man inevitable? Rather than arguing for a position, Cavendish is content to lay out the logical space of the gender politics of her day. The prefaces and introductions to her books also contain defences of her desire to publish and her ability, as a woman, to do philosophy. Her experimentation with varied philosophical genres is, in part, an attempt to find a form which her readers would find acceptable: one in which a seventeenth-century woman, explicitly seeking fame as a natural philosopher, might give voice to her views.

List of works

Cavendish, M. (1653) *Poems, and Fancies*, London; facsimile repr. Menston: Scolar Press, 1972; *Poems, and Phancies*, The Second Impression, much Altered and Corrected, London, 1664; *Poems, or Several Fancies in Verse: with the Animal Parliament, in Prose*, The Third Edition, London, 1668.(Atomism expressed in verse form, together with poems on moral topics such as cruelty to animals, and whimsical verses about fairies and other incorporeals.)

Cavendish, M. (1653) *Philosophicall Fancies*, London.(A prose exposition of her materialist natural philosophy.)

Cavendish, M. (1655) *Philosophical and Physical Opinions*, London; 2nd edn, London, 1663.(This revised version of *Philosophicall Fancies* is a transitional work, in which Cavendish begins to reject mechanistic atomism in favour of an organicist materialism; the substanially revised second edition, reissued as *Grounds of Natural Philosophy* (1668), expounds her mature system of natural philosophy.)

Cavendish, M. (1655) *The World's Olio*, London; The Second Edition, London, 1671.(A collection of mostly prose works, it also contains some poems on atomism first published as Part I of *Poems, and Fancies*.)

Cavendish, M. (1655/6) *Nature's Pictures Drawn by Fancie's Pencil to the Life*, London; 2nd edn, *Natures Picture Drawn by Fancies Pencil to the Life*, London, 1671.(The first edition of this collection of largely fictional sketches includes her autobiography, 'A True Relation of my Birth, Breeding and Life', which is not found in the second edition.)

Cavendish, M. (1662) *Playes*, London.(Some plays include discussions about gender politics, such as *The Female Academy* and *Bell in Campo*; excerpts from the latter play appear in *Women Writers of the Seventeenth Century*, ed. K. Wilson and F. Warnke, Athens, GA: University of Georgia Press, 1989.)

Cavendish, M. (1662/3) *Orations of Divers Sorts, Accomodated to Divers Places*, London; 2nd edn, London, 1668.(Includes 'The Female Orations' reprinted in *The Norton Anthology of Literature by Women*, ed. S. Gilbert and S. Gubar, New York and London: W.W. Norton & Co., 1985.)

Cavendish, M. (1664a) *CCXI Sociable Letters*, London; facsimile repr. Menston: Scholar Press, 1969.(An epistolary narrative praised by Charles Lamb, which has been compared to Samuel Richardson's works, it provides details of the historical and intellectual setting in which Cavendish was writing.)

Cavendish, M. (1664b) *Philosophical Letters: or, Modest Reflections Upon some Opinions in Natural Philosophy, maintained By several Famous and Learned Authors of this Age, Expressed by way of Letters: By the thrice Noble, Illustrious, and Excellent Princess, the Lady Marchioness of Newcastle*, London.(Letters to a fictious noblewoman, in which she criticizes the views of Descartes, Hobbes, More and van Helmont in light of her own system of natural philosophy; letters concerning Descartes are reprinted in *Women Philosophers of the Early Modern Period*, ed. M. Atherton, Indiannapolis, IN: Hackett Publishing Company, 1994.)

Cavendish, M. (1666) *Observations upon Experimental Philosophy, To which is added, The Description of a New Blazing World*, London; the additional text was reissued as *The Description of a New World, called the Blazing-World*, London, 1668; repr. in *The Blazing World and Other Writings*, ed. K. Lilley, London and New York: Penguin, 1992.(A treatise of her natural philosophy, published with a utopian fiction that intimates some of her philosophical positions and parodies views about incorporeal spirits.)

Cavendish, M. (1667) *The Life of the thrice Noble, High and Puissant Prince William Cavendishe, Duke, Marquess, and Earl of Newcastle…*, London; 2nd edn, 1675; Latin trans. W. Charleton as *De vita et Rebus Gestis…Guilielmi Ducis Novo-Castrensis…*, London, 1668; numerous reprints.(This early English biography has gained Cavendish a place in literary history; she has been known primarily for this work.)

Cavendish, M. (1668a) *Plays, never before Printed*, London.(Some plays include discussions about gender politics, such as *The Convent of Pleasure*, excerpts from which appear in *First Feminists: British Women Writers 1578-1799*, ed. M. Ferguson, Bloomington, IN: Indiana University Press, 1985.)

Cavendish, M. (1668b) *Grounds of Natural Philosophy… The Second Edition, much altered from the First which went under the Name of Philosophical and Physical Opinions*, London.(A reissue of the 1663 work; together with *Philosophical Letters* and *Observations upon Experimental Philosophy*, this work constitutes the expressions of her mature natural philosophy.)

Celsus (late 2nd century AD)

The Greek philosopher Celsus of Alexandria was a Middle Platonist, known only for his anti-Christian work The True Account. The work is lost, but we have Origen's reply to it, Against Celsus. In it Celsus defends a version of Platonist theology.

Celsus is known only as the author of a polemical work against the Christians entitled *Alēthēs logos*, which may be translated *The True Account*, although other connotations of *logos* are also present in the title (see Logos). We know of this work only through the reply (*Against Celsus*) composed to it in AD 248 by the Church Father Origen, who does not in fact know who Celsus is (see Origen §1). We too know nothing about Celsus, but can date his work fairly closely from references in it to a persecution of Christians under a joint rulership which must be that Marcus Aurelius and Commodus (AD 177-80).

The title of Celsus' book may also refer to a passage of Plato's *Meno* (81a), where Socrates speaks of the ancient doctrine he has heard concerning the immortality of the soul as a 'true account' (see Plato §11). One of Celsus' polemical points certainly is that Platonic philosophy is in accord with the wisdom of the most ancient authorities, such as Orpheus and Homer - a common enough view among the Neoplatonists. As regards his own philosophical position, it is hard to pin him to any particular tendency within contemporary Platonism. He shows the expected contempt for a notion like the resurrection of the body (Origen, Against Celsus V 14), or the idea that god made man in his own image (VI 63), there being nothing that could resemble god. At VII 42, he gives a basic account of the Platonist view of the supreme god, which is incompatible with the notion of his involving himself too closely with matter. He alludes, indeed, to the notion of the supreme god being 'beyond being' (Plato, *Republic* 509b), and the title of his work may indicate his adoption of the *logos* as a secondary god, but we cannot be sure. He mentions three ways of attaining a conception of god - synthesis, analysis and analogy, which correspond approximately to the three ways distinguished by Alcinous in his *Didaskalikos*, chapter 10, although there is no indication that Celsus knows that work. Contact between man and god is effected, of course, through the agency of daemons, whom the Christians are criticized for disdaining (VIII 28, 33, 35).

All this is very non-specific. *The True Account* is an interesting document, none the less, as a sign that Christians are coming to be of some weight in society, to the extent of meriting the sort of polemical refutation which hitherto the philosophical schools had directed against each other. Celsus' work is of the same genre as his contemporary Atticus' attack on the Peripatetics, Plutarch's attacks on the Epicureans and Stoics (see Plutarch of Chaeronea §1) and, later, Plotinus' treatise *Against the Gnostics* (Enneads II 9).

Certainty

'Certainty' is not a univocal term. It is predicated of people, and it is predicated of propositions. When certainty is predicated of a person, as in 'Sally is certain that she parked her car in lot 359', we are ascribing an attitude to Sally. We can say that a person, S, is psychologically certain *of a proposition, p, just in case S believes p without any doubts. In general, psychological certainty has not been a topic which philosophers have found problematic.*

On the other hand, certainty as a property of propositions, as in 'The proposition that Sally parked her car in lot 359 is certain for Sally', has been discussed widely by philosophers. Roughly, we can say that a proposition, p, is propositionally certain *for a person, S, just in case S is fully warranted in believing that p and there are no legitimate grounds whatsoever to doubt that p. The philosophical issue, of course, is whether there are any such propositions and, if so, what makes them certain.*

1 Types of certainty

Before directly considering certainty, it would be useful to distinguish it from another notion - that of infallibility. Although neither concept has been employed in a universally accepted way by philosophers, generally it has been held that a person, *S*, is infallible with regard to a proposition, *p*, just in case it is not possible for *S* falsely to believe that *p*. For example, it might not be possible for persons falsely to believe of themselves that they have beliefs. But the range of such contingent propositions, if any, is very small indeed; and philosophers have been interested in whether certainty extends to a much wider range of contingent propositions. In addition, a person could be infallible with regard to some propositions, even if those propositions are not at all warranted. For example, consider any necessary truth. It would not be possible for *S* mistakenly to believe it, since it is not possible for that proposition to be false. But it may have little or no warrant for *S*. Since propositional certainty is inextricably connected with warrant, infallibility and certainty should not be conflated (see Fallibilism).

So let us turn to a direct examination of certainty. Psychological certainty is an attitude that persons can have towards a proposition, and propositional certainty is a measure of the epistemic warrant for a proposition. Thus, it is clear that psychological certainty and propositional certainty are logically independent. For *S* could be certain that *p* on inadequate grounds or, in some extreme cases, on no grounds whatsoever. On the other hand, a person could have the best grounds for believing *p* and no basis for doubt, but none the less fail to believe *p* with a high degree of resolve because of timidity.

Although the two types of certainty are logically independent, there is a connection between them. Presumably a person would want the degree of belief in a proposition to parallel the degree of epistemic warrant for it. Descartes' *Meditations* (1641), one of the starting points of contemporary epistemology, can be seen as his attempt to determine which, if any, propositions are certain, in order to adjust his degree of belief accordingly (see Descartes, R. §4). If he is correct, very few propositions are certain (for example, 'I exist' and others revealed by the 'light of nature'). In particular, he argued that those based upon experience (for example, 'there is a table before me') are never certain because there is always some legitimate basis for doubt. Other philosophers, for example, G.E. Moore, argued that many propositions based upon experience can be certain (see Moore, G.E. §3; Commonsensism). The remainder of this entry discusses some of the more influential accounts of propositional certainty.

A contextualist account has been developed by both Moore and Wittgenstein (see Contextualism, epistemological). Although the specifics of the views vary, a contextualist account of propositional certainty claims, roughly, that the range of propositions that are fully warranted and beyond doubt or challenge is determined by the presuppositions of the context of discussion. As Aristotle remarked:

> [Some] people demand that a reason shall be given for everything, for they seek a starting point, and they seek to get this by demonstration, while it is obvious from their actions that they have no conviction. But their mistake is what we have stated it to be; they seek a reason for things for which no reason can be given; for the starting point of demonstration is not demonstration.
>
> (Aristotle *Metaphysics*: 1010a 8-14)

Wittgenstein (1949-51) and Moore (1959) have argued that the proposition, 'here's one hand', for example, is

certain in most contexts. It might not be certain if, for example, we knew that there are several fake hands resting on a table and we also know that there is a hole in the table through which people sometimes put their hands just to fool us. But in the normal circumstances, it is certain. (It should be noted that Wittgenstein and Moore differ about whether knowledge entails certainty. Wittgenstein held that 'knowledge' and 'certainty' belong to different categories because knowing requires justification whereas a proposition is certain only if it does not require a justification.)

Contextualism can be challenged because it blurs the distinction between psychological and propositional certainty, for the latter is characterized in a way that makes it roughly equivalent to group psychological certainty, thus eschewing the notion of epistemic warrant. For example, in Salem, Massachusetts in the 1600s, it would have been propositionally certain (given a contextualist account) that there were witches. But, it could be argued that although such a proposition was taken for granted, it was never fully warranted and was always subject to legitimate doubt. More generally, it could be claimed that propositions that are certain might not be, and typically are not, equivalent to the ones that are taken for granted.

A modification of the contextualist view, suggested by David Lewis (1979), can be employed to mitigate this objection. Let us grant the basic contextualist point that in order for genuine doubt to occur, there must be some propositions that 'stand fast' (to use Wittgenstein's expression) which can be employed to remove or substantiate the doubt. None the less, what stands fast at the beginning of a discussion (even if held with oneself) could become doubtful as the discussion progresses. Grounds for doubt can increase as knowledge expands or simply because new possibilities are envisaged. Suppose, for example, that one of the participants asks 'Are you really sure that is a hand? After all, does not the certainty of that proposition depend upon the belief that your senses are generally reliable? Can you be certain of that?' Now, of course, the other participants can refuse to rise to the philosophical bait. But, by introducing the general question of the reliability of the senses, one of the participants has exposed one of the contextual presuppositions, thus making it eligible for doubt. Lewis' modification of the contextualist view provides a partial response to the objection because the worthiness of belief in a proposition that once stood fast can be addressed by participants by altering the context.

Nevertheless, the fundamental challenge to contextualism remains unanswered: Why should the contextual presuppositions, even the shifting ones as described by Lewis, determine which propositions are actually worthy of belief? Indeed, are any propositions worthy of belief, even those which play the quasi-foundational role ascribed to contextual presuppositions? That is the Cartesian question.

2 Propositional certainty

Some philosophers (for example, Hegel and Dewey) reject the Cartesian question, holding that it incorrectly presupposes an 'independently existing' reality whose nature is the object of inquiry (see Idealism; Pragmatism). Dewey wrote:

> Knowing is, for philosophical theory, a case of specially directed activity instead of something isolated from practice. The quest for certainty by means of exact possession in mind of immutable reality is exchanged for the search for security by means of active control of the changing course of events. Intelligence in operation, another name for method, becomes the thing most worth winning.
>
> (Dewey [1929] 1960: 204)

Other philosophers would argue that although *some* properties of *some* objects are affected by our interactions with them during the process of inquiry, it does not follow that *all* the properties of the object are affected or even that *all* objects have some properties that are affected by inquiry. To use an example cited by Dewey, suppose that the location or velocity of an atomic particle is altered when it is observed. None the less, its property of being within 100 miles of the earth's surface would not be affected. In addition, presumably, some very large objects can be observed without affecting them at all (stars that are millions of light years away, for example). Indeed, many properties (for example, being a conifer) or objects (for example, trees) appear to be mind-independent. But more importantly, even if all objects and properties are somehow mind-dependent, the Cartesian question appears to remain: Is any claim about objects and properties, whatever they are, fully warranted and not subject to any legitimate doubt?

In order to answer this question, it is important to note as did Peter Unger (1975) that in the relevant sense, ‘certainty’ (like, for example, ‘perfect’) is an absolute term. It does not come in degrees. Although we do say that some propositions are more certain than others, it has been pointed out that such expressions are equivalent to the claim that some propositions are more nearly certain than others. Certainty, like perfection, does not come in degrees although we can approach it by degrees.

Roderick Chisholm’s (1977) account of certainty captures this absolute sense. He suggests that a proposition is certain just in case it is warranted and there is no proposition more warranted than it. None the less, although that account incorporates an important necessary condition of propositional certainty, it ignores two crucial features - namely that a proposition is certain only if it is fully warranted and it is beyond legitimate doubt. A proposition could satisfy the proposed condition and still be only partially warranted and subject to doubt, as long as no propositions are more warranted or subject to less doubt.

So, let us focus on what makes a proposition fully warranted and not the least bit doubtful. The first condition is rather easily defined. Given any account of warrant (for example, either an internalist or reliabilist account), we can say that a proposition is fully warranted just in case it is warranted and there is no incompatible proposition that is at all warranted (see Justification, epistemic §3).

Immunity to legitimate doubt is more difficult to characterize. None the less, two senses of doubt seem relevant here. We can say that a proposition, *p*, is *subjectively doubtful* for *S* if and only if there is some proposition which *S* is not warranted in denying which is such that it lowers the warrant of *p* (even the slightest degree). This is roughly equivalent to Descartes’ account of certainty employed in the *Meditations* and is subjective because whether a proposition is immune to this type of doubt depends upon *S*’s particular prior beliefs. They could be false. Indeed, a proposition which is subjectively certain could be false. So, subjective immunity from doubt cannot be the entire story.

A second sense of propositional certainty is relevant: objective certainty. We can say that a proposition is *objectively doubtful* for *S* if and only if there is some *true* proposition which if added to *S*’s beliefs lowers the warrant of *p* (even to the slightest degree). This is objective because *S*’s warrant for *p* will be diminished if some of that warrant depends upon a false belief of *S* or if there is some true proposition that counts against *p* for which *S* has no explanation (based only on true propositions within the corpus of warranted beliefs). Finally, if *p* were false, its negation added to *S*’s beliefs would undercut the warrant for *p*. Hence, propositions immune to objective doubt are true.

It is now possible to suggest an account of propositional certainty. We can say that a proposition, *p*, is certain for *S* if and only if it is fully warranted and is neither subjectively nor objectively doubtful. Philosophers do not agree about either the range of such propositions or about whether knowledge entails certainty. Rationalists, typically, hold that certainty is a necessary condition of knowledge and that (only) a priori propositions are certain. Some - but only some - empiricists will hold that certainty is not a necessary condition of knowledge. Finally, many sceptics have held that knowledge entails certainty, and since no proposition is beyond legitimate doubt, no proposition is known.

Certeau, Michel de (1925-86)

*Michel de Certeau, a French philosopher trained in history and ethnography, was a peripatetic teacher in Europe, South America and North America. His thought has inflected four areas of philosophy. He studied how mysticism informs late-medieval epistemology and social practice. With the advent of the Scientific Revolution, the affinities the mystic shares with nature and the cosmos become, like religion itself, repressed or concealed. An adjunct discipline, heterology, thus constitutes an anthropology of alterity, studying the 'other' and the destiny of religion since the sixteenth century. De Certeau opens the hidden agendas that make representations of the past a function of social pressures, so that sometime histories are rearticulated in mirrored or subversive forms. This subversion makes accessible a general philosophy of invention that works within and against the strategic policies of official institutions. De Certeau's writings also belong to activism, the history of ideological structures, psychoanalysis, and post-1968 theories of writing (*écriture*) as defined by Deleuze, Derrida, Foucault and Lyotard.*

For de Certeau, mystics are those strange beings who claim to have left the material and sensory world and encountered an unnameable being, or an unearthly experience, but have returned with visible marks - scars or mutilations - that attest to the truth of what they say. They eagerly tell of their visions to others. They are creatures of passage who invent places in which they disappear, and whose words convey to their listeners the supraterrestrial qualities of the world and language. They liberate those whom they meet, inspiring them to cognizance of areas that cannot be controlled by rational or symbolic means. Mystics are frequently female, often rootless, sometimes grimy and occasionally without formal education. The mystic belongs to all religions but appears on the European horizon at the time major edifices of belief slowly crumble under the pressure of science, oceanic travel, schematic reason (Ramus, Descartes) and pre-capitalist economy.

When the substantive *mysticism* is coined in the early seventeenth century, the behaviour and philosophy become the subject of scientific inquiry, thus relegating a formerly accepted, but almost unnameable condition to the margins of civilization. Mystical activity returns, however, in subjective areas of everyday life, has roots in politics (for example, ecology and feminism), and is a principal concern in Freudian and Lacanian psychoanalysis. Included in de Certeau's studies are close readings of Jean-Joseph Surin, Nicolas of Cusa, Hieronymus Bosch and the wily, nomadic Freud of *Moses and Monotheism*.

De Certeau's contributions to the philosophy of history importantly concern the silencing of mystical language since the French classical age. Since the advent of print culture official historians have laboured to produce monuments reflecting the structures of power that sustain them. For de Certeau, the 'historiographical operation' constitutes the laws governing the creation of these pantheons of 'truth'. But the conceptual/social order of this historiography is also contested - by those (for example, Machiavelli) who tamper with its codes or who make visible its ideology.

Heterology, the second of de Certeau's philosophical inflections, is his name for the 'science' of otherness or alterity. Its topic is whatever resists being named, classified, or organized in a body of knowledge, often what generates or inspires it. This resistant other takes the form of those nocturnal musings, beings, impressions, dreams or epiphanic flashes that fascinate but cause consternation to the diurnal being. Frequently, the *other* who irrupts into the familiar world of sameness is the Indian (such as the Tupinamba in Jean de Léry's *Voyage to Brazil* of 1578), the wanderer (the footprint of Friday on Crusoe's island, or Panurge who disrupts the princely realm of Rabelais's *Pantagruel*), or the savage, the peasant isolated from urban development (those whom the Abbé Grégoire encounters in rural France in his 1791 study of the provinces). They can wear the garb of a literary double (Jekyll's Hyde) but may also resemble the *intercessor* (as Gilles Deleuze and Félix Guattari define the term in *What is Philosophy?*). The welcome extended to and cultivation of the other are vital, argues de Certeau, for the grounding displacement and deracination that mobilize inquiry, belief, affect and knowledge.

Invention, from its Latin sense (*invenire*, to happen upon, to choose) describes a vital area of de Certeau's philosophy of everyday life. Since capitalism has mapped out the world and, through mass media, colonized the subjective imagination, every individual becomes responsible for creating practices that do not serve the economy, but that give definition to autonomous and unofficial ways of living. Invention entails conceiving of *other* spaces in which the individual subject cannot be plotted, located or, as have been most third world natives, bartered, bled

or tortured. Based in part on Lévi-Strauss's concept of *bricolage*, which is the indigenous 'science of concrete activity' that fashions new meanings from fragments of myth and quotidian objects, the art of invention includes practices of walking (a performative 'space act' analogous to J.L. Austin's ' speech act'; see Speech acts), of making different things from a gamut of inherited forms (cooking, playing), and of opening different mental spaces (via thinking or reading) in areas that otherwise lie under strict ideological control. In this way the anonymous subject, no matter what their origins, can philosophize and act so as to live within but also to change the tenor of inherited, often limiting, social conditions.

De Certeau's non-philosophical writings are no less varied than his philosophy. They range from dense and erudite historical studies (including critical editions) to collective and polemical tracts aimed at changing educational philosophy and the tradition of subjectivity. He ranks among the most important figures who pragmatized critical theory and the human sciences in France after the intellectual revolution of May 1968.

Chaadaev, Pëtr Iakovlevich (1794-1856)

Pëtr Chaadaev was the first Russian thinker for whom his own country became a philosophical problem. His works initiated the powerful Russian tradition of reflecting on Russia's whence and whither: that is to say, the meaning of Russian history, the character of Russian national identity, and the possible, or necessary, paths of Russian historical development in the future. However, Chaadaev's answer to these questions was mostly negative: he defined Russia not by what it was, but by what it was not.

A paradoxical feature of Chaadaev's s position was that his general philosophical views did not apply to his native country. He was a convinced Westernizer, identifying Western development with universal human history, but Russia was in his view the opposite of the West, an exception to the general rules. His general social philosophy, deeply influenced by the French theocratic traditionalists, was inherently conservative, stressing the importance of supra-individual unity and of continuous historical traditions; in contrast with this, his philosophy of Russian history defined Russia as a country without unity and without history, thus lacking the basic conditions for a genuine conservatism. This view provoked a strong reaction among Russian Romantic conservatives: they accepted some aspects of Chaadaev's conservative critique of atomistic individualism but tried to refute his pessimistic view of Russia, by arguing that, in fact, not Russia but the West represented atomistic disintegration and incapacity for organic development.

1 Metaphysics and philosophy of man

In his youth Chaadaev, a promising Russian officer and a friend of Pushkin, was a Freemason (from 1814) and a sympathizer of the Decembrist movement, named after the ill-fated military uprising which took place in December 1825. During his travels in the West in 1822-6 he intensely studied the counter-Enlightenment trends in European thought and, as a result, underwent a spiritual crisis which confirmed him in his leanings towards Roman Catholicism. The failure of the Decembrist uprising he saw as an additional proof of the bankruptcy of the rationalistic belief in progress through political change. On his return to Russia in 1826 he withdrew into almost complete seclusion and devoted himself entirely to the task of formulating his philosophical view of the world. He fulfilled this task in the eight 'Lettres Philosophiques' (Philosophical Letters) (written in French between 1828 and 1831), of which only the first, devoted to Russia, was published during his lifetime, in the journal *Teleskop (Telescope)* in 1836.

Following the French traditionalists - de Maistre, de Bonald and the early Lamennais - Chaadaev attacked in his Letters the moral and intellectual autonomy of the individual. The natural order of things, he argued, is based upon dependence and submissiveness. Moral law, like truth, is not something autonomous, as Kant claimed, but a force outside us; individual reason separates man from the universe and makes true understanding impossible; hence it should be subordinated to the universal reason of humankind. Being is hierarchically stratified: at the summit is the transcendent God; his emanation is the 'world consciousness', that is, supra-individual social consciousness, living in tradition and developing with it; below is the empirical consciousness of isolated individuals; on the lowest rung is pre-human nature. In this way Chaadaev combined the traditional theistic conception of a transcendent God with pantheistic emphasis on God's immanent presence in the world. This was in tune with Christian Neoplatonism (which reached Chaadaev through the esoteric tradition in Freemasonry, as well as through Schelling, whom he personally met in 1825) and with the panentheistic religious ideas of the German Romantics.

Chaadaev's conception of the 'social sphere' and supra-individual social consciousness provides the key to his philosophy of history. Knowledge, he argued, is a form of collective consciousness. Without society, that is, the supra-individual sphere which allows traditions to be handed down, human beings would never have emerged from the animal state. Also in religious experience the social sphere is of decisive importance: through it alone can the individual come to know God and to become a vessel for the divine truth. Therefore the surest way to God leads not through individualistic self-perfection or solitary ascetism but through strict observance of traditional norms and active participation in social life. The highest aim of man is 'the annihilation of his personal being and the substitution for it of a perfectly social or impersonal being'. The foundation of the inner unity of society is religion, whose necessary guardian is the institutionalized Church. Ecclesiastical mediation between man and God is indispensable for salvation, since efforts to achieve unmediated, individualized contact with God weaken the

discipline of the soul and bring about social disintegration.

In his philosophy of history Chaadaev attempted to reconcile the notion of a transcendent Providence with an immanentist approach, looking for the inner patterns that govern events and transform history into a meaningful process. The instruments of history are great, chosen individuals and historical nations, that is to say, nations which constitute supra-individual ‘moral personalities’. The mission of historical nations is to rise towards universality; hence they cannot lock themselves up in nationalistic particularisms and superstitions. Since the time of Christ the substance of history and the focal point of ‘world consciousness’ is Christianity, and the purest, most ‘historical’ and ‘social’, manifestation of Christianity is Catholicism. The Renaissance and Reformation had destroyed the splendid unity of medieval Christendom and pushed humanity towards increasing social atomization and neo-paganism. Now, however, this great spiritual crisis was drawing to a close. The process of corruption had reached its lowest point but Christianity had not collapsed; on the contrary, there were signs of its imminent regeneration and progressive transformation.

In defining this transformation Chaadaev followed the favourite idea of the post-Revolutionary French thinkers, both traditionalist (like de Maistre), and utopian socialist (like the Saint-Simonians): the idea of a renewed, socialized Christianity which was to bring about the ‘socialization of societies’, the extension of Christianity from private life to public sphere, that is the effective ‘ethicization’ of social and political relations. Christianity, he felt, was becoming social, and humankind was entering the last phase of the establishment of the Kingdom of God on earth.

2 Philosophy of Russian history

In his views on Russian history Chaadaev drew a sharp contrast between Russia and the West, as well as between Russia and ‘historical nations’ in general.

According to Chaadaev, Russia had no history. He meant by this that Russian history was merely a collection of meaningless events, lacking the continuity of tradition and the unity of purpose. This was so because of Russia’s separation from the universal Church, the Church of Rome. True, the Russians were Christians, but so were the Ethiopians; in both cases religious affiliation did not ensure membership of the Christian civilization. The European nations were marching through the centuries hand-in-hand, had fought together to free the Holy Sepulchre and prayed to God in one and the same language. The history of the West was sacred history, the Kingdom of God had to some extent already materialized in Europe. Russia, however, was a country forgotten by Providence, having no supraindividual consciousness and moral personality of its own, not covered by the ‘universal education of humankind’. Therefore the Russians had no guidelines and support in their past, lived without fixed customs and rules for anything, knew nothing about the ideas of duty, justice, rights and order. The ‘Western syllogism’ - logic and methodical thinking - was completely alien to their undisciplined minds. Small wonder that they grew but did not mature, that ‘not a single useful thought had sprouted in the sterile soil’ of their country.

The impression evoked by the publication of the ‘Philosophical Letter’ was enormous and almost completely negative. The most important exception was Aleksandr Herzen who appreciated the ‘Letter’ as a powerful protest against the hopelessness of Russian life under autocracy. The Tsar Nicholas I decided that Chaadaev should be treated as a madman and subjected to compulsory supervision by physicians and the police. This explains the title of Chaadaev’s text ‘Apologie d’un fou’ (The Apology of a Madman) (1837), in which he tried to make his views more palatable for Russian patriots. He admitted that his interpretation of Russian history was too severe and drew from his main thesis a different conclusion. The ‘lack of history’, he now argued, might also be a kind of privilege: without the burden of the past Russia would meet no obstacles in learning from the experience of Europe and in grounding its future on purely rational foundations.

In this way the Russian admirer of tradition formulated the view that being a blank sheet of paper made Russia a country of the future, destined to solve the grave social problems which had arisen in the West. This view, thanks to Herzen, was later to serve the purposes of Russian revolutionaries.

It is hard to say to what extent Chaadaev identified with his new view on Russia. It is likely that he really did admit the possibility of a great future for Russia, but was far from holding this view unreservedly. He could hardly be enthusiastic about the image of a civilization deprived of a religious basis and founded on purely scientific and

anti-historical principles. Hence he tried to combine his new ideas with his old dream about Russia's inclusion into the universal history. This implied the removal of the main cause of Russia's 'lack of history' - its separation from the Church of Rome.

3 Ecumenical ideas

Chaadaev's manuscripts, especially his 'Fragments et pensées diverses 1828-1830' (Fragments and Thoughts 1828-1830), show that his overall view on the Orthodox Church was in fact far from the one-sidedly negative picture presented in 'Philosophical Letters'.

The Western Church, Chaadaev argued, was called to make history. It was ambitious, intolerant and did not despise the goods of this world, but this was the reverse side of its sublime mission in universal history. The mission of the Eastern Church was quite different, unhistorical, as it were. It developed the contemplative and ascetic aspect of Christianity, and hence all forms of secular ambition were forbidden to it as incompatible with its inner essence. In this way Chaadaev arrived at the conception of the Roman Catholic and the Orthodox Church as the two poles of the absolute truth. On the one side there was 'activism' and 'sociality', on the other, monastic concentration of spirit, contemplation and the evangelical purity of Christ's teaching. But there can be no doubt that Chaadaev wanted the Kingdom of God to be realized in history and saw the Church as its historical incarnation. It followed from this that the Catholic Church was historically much more important, although the Orthodox Church (unlike the Protestant churches) was also a legitimate and valuable part of the Christian heritage. Hence the need of reconciliation and union between the two Churches: not a simple conversion of the Orthodox Christians to Catholicism but a union on equal rights, with the due recognition of the separate traditions of both Churches.

Very similar, if not identical, views were developed later (partially under Chaadaev's influence) by Vladimir Solov'ëv. It is justified to see Chaadaev as an important precursor of Solov'ëv's philosophical ecumenism.

In the history of Russian thought Chaadaev's name was firmly associated with pro-Catholic sympathies. Even Herzen saw him as representing 'neo-Catholicism', or 'revolutionary Catholicism'. The first edition of Chaadaev's works was published by the Russian Jesuit, Father Ivan Gagarin, whose conversion to Catholicism was caused by Chaadaev's 'Philosophical Letter' on Russia. Small wonder that Chaadaev's heritage could not be fully appropriated by Russian religious thinkers; nor, of course, by the programmatically secularist ideologies of the 'progressive intelligentsia'. In Soviet Russia attempts were made to present Chaadaev as a 'progressive' thinker, but publishing his collected works, let alone honestly discussing his ideas, was impossible. In post-communist Russia Chaadaev's works have been published in full and, for the first time, widely distributed. None the less, his place in the rich tradition of Russian religious philosophy and in the history of Russia's national self-identification has not become sufficiently clarified.

Chaldaean Oracles

The Chaldaean Oracles were a collection of revelatory verses purportedly compiled in the second century AD. Along with the Orphic texts, Neoplatonists regarded them as divine words. When the Oracles appear in philosophical works, they lend support to select cosmological, metaphysical or psychological propositions which have already been formulated.

According to Neoplatonists, the *Chaldaika logia*, or Chaldaean Oracles, originated with a certain Julianus, a late second-century AD ex-soldier in the eastern Roman army, and with his son, also named Julianus, who was their author. The father, surnamed 'Chaldaean' and a 'philosopher', may have collected handed-down material which he passed on to his son, a 'theurgist', who was 'divinely inspired' to write new oracles. This origin, some seventy years before Porphyry, by whom they are first mentioned, is by no means certain. However, it may be corroborated by similar material in Numenius, an important Neo-Pythagorean. Numenius flourished at that time in Apamea (Syria), where later Plotinus' theurgic-minded follower Amelius went to teach, as did Iamblichus, who was a major proponent of theurgy and the Oracles. Both Porphyry and Iamblichus had Syrian parentage. Moreover, in a unique fragment preserved by Proclus (*Commentary on Plato's Parmenides*, 594-5), 'the true theologians' used Syriac terms. Yet the question remains, how much was handed down and how much made up in a culture where Greek and Oriental had mixed since the third century BC and religions had absorbed Platonic ideas.

'Chaldaean' was often an honorific title for long-established wisdom, owing to the ancient astronomy of the Babylonians. In classical, and especially biblical, Greek, *logia theou* are God's own sayings (for example, the 'Hebrew *logia*' given to Moses, and those revealed in the New Testament). Neoplatonists, such as the emperor Julian, Proclus and Damascius, referred to the Chaldaean sayings as 'of the gods' or 'God-given' (*theoparadota logia*; an expression later used by John Damascene for revelation in the Christian Church). For comparison, Iamblichus also spoke of 'Pythagoras' *logia*. Thus the *logia* are statements directly attributed to a supreme authority.

Of the various fragments, some cite distinctive entities particularly, the 'wry necked' (*iynges*) birds, as divine powers. Others reflect general Babylonian and Mithraic themes (fire as creative and divine). Many rely on Platonism: 'cyclo-spiral' time (from Plato's *Timaeus*, where the planets have compound orbits and are cosmic clocks); divinity is 'once' (*hapax*) and 'twice transcendent' (*dis epekeina*) (based on the Good in Plato's *Republic*). However, two cosmological themes seem to be Chaldaean and important. First, there is a hierarchy of divinity, of which the highest, called 'Father', is an 'abyss'. Neoplatonists tried to associate this highest divinity with their transcendent One, or with Being or essence, which is opaque to ordinary conception but intuitively intelligible. Second, the universe is divided into 'material', 'aetherial' and 'empyrean' 'zones', of which the 'aetherial' indicated the semi-materiality of vital soul, and the 'empyrean' the transcendent world. However, the Neoplatonists associated the 'material' with earth and physical matter; the 'aetherial' with the heavens populated by stars and planets; and the 'empyrean' (fiery) with the incorporeal domain. Later, when amalgamated with Aristotelian and Christian themes, the whole scheme flourished in graphic representations of the universe through the Middle Ages to the seventeenth century.

The Chaldaean Oracles are referred to by all the later Neoplatonists down to Simplicius (sixth century), and by some Christians. The Oracles also emerge in Byzantine sources; for example, Psellus (eleventh century) and Plethon (fifteenth century), who collected them in a manuscript titled 'Sayings of the Zoroastrian Magi'. Finally, they were transmitted to Renaissance Italy, where they were used mainly by Patrizi da Cherso, Ficino and Pico della Mirandola for lending support to their own anti-Aristotelain arguments.
